Most farmers who have ever grown any of the clovers, cowpeas or soybeans understand that on the roots of any of these plants may be found little wart-like growths or nodules, and while we may not fully understand the function of these nodules, we do know that without them these crops will not do well. The housewife knows very well that unless she adds the proper amount of yeast she can not make bread and so it is in trying to grow a legume crop, unless these bacteria are found in the soil we must put them there. Each plant has its own bacteria and the one will not grow on the other except that in closely related plants like sweet clover and alfalfa the same bacteria grows on both crops. Where the soil is rich, well drained and plenty of lime sometimes we may succeed without inoculation but on all fields where alfalfa is sown for the first time the soil should be inoculated. It is a very simple matter to do it and as the chances are so much better for success we would not think of sowing the first time without. Cultures may be bought from reliable dealers or may be obtained in small quantities from the U. S. Department of Agriculture and instructions for use furnished with the packages. In most places in Missouri inoculating material may be conveniently obtained from an old alfalfa field or from the road side where sweet clover is growing. From any field where alfalfa is growing successfully and nodules are found on the roots or from the sweet clover soil just spade up enough soil to spread two or three bushels over each acre of the field to be sown. As bright sunlight will soon kill the bacteria it is best to get this soil on a cloudy day or keep it covered up to keep out the sunlight. This soil should be sown broadcast over the field, preferably just after the seed is sown and then follow with a harrow to cover the inoculated soil. It may look foolish to an old practical farmer to scatter a few handfulls of dirt over his field to make crops grow but if it brings results he need not stop to ask what others think.

Pasturing Alfalfa

While alfalfa makes good pasturage it is without question that under Missouri conditions that it will be grown primarily for hay. In a humid climate like ours there is great danger in pasturing cattle and sheep on account of bloating, particularly in the spring and early summer. For horses there is not this danger but because of the close grazing and tramping, it is not advisable to pasture heavily with horses. One of the most profitable uses that can be made of an alfalfa crop is to pasture it with hogs. For this purpose it is best to have two fields, pasturing the fields alternately so the alfalfa can be mown two or three times a year for hay. In this way the stand may be maintained for several years, the mowing will keep down weeds and by mowing the fields at different times the hogs will have a tender, succulent growth to

A great many alfalfa growers think they get better results by raking the alfalfa into windrows as soon as wilted and after a few hours more sun put it into the shock. In two or three days the alfalfa is ready for stacking. Whatever method is used the alfalfa should not get too dry in the swath or most of the leaves will be lost in handling.

feed on and enough hay taken from the field to pay well for mowing it.

Time and Methods of Harvesting

Making good hay from any crop is more important than many farmers believe. There is a wide difference in the quality of hay cut at different stages of growth and there is also a great difference on the effect of the future growth of the crop, and this is probably more noticeable with alfalfa than with any other plant. If alfalfa is cut too soon it makes an inferior quality of hay and is hard to cure. If it stands too long the stems become woody, the bottom leaves will rust and drop off and the stand may be injured. An experienced man can tell by the maturity and color of the leaves when it should be cut, but the man who is not familiar with alfalfa should be governed by the starting of the young shoots at the crown near the surface of the soil. When the majority of the stalks show the young shoots are starting it is ready to harvest. Some go by the bloom, cutting about the time one-fifth is in bloom, but this is not so reliable a guide as the starting of the new shoots.

Some have objected to growing alfalfa because the first cutting must be harvested in May when the weather is apt to be more or less showery, but suppose you lose one cutting entirely and get three more you are ahead of most any other crop. But men who have raised alfalfa for twenty years tell us they seldom lose a crop. There are two methods followed in cutting. First, to cut as soon as the dew dries off and rake into windrows as soon as well wilted. That may be late in the afternoon or not until some time the next day owing to the thickness of the swath and to the weather. Second, wait until afternoon, 2 o'clock or later and cut until the dew begins to fall and rake when wilted, which will probably be the next afternoon. If the hay is left in the swath until dry it makes brown hay and much of the leaves, the best part of the hay, will be lost in handling.

Where the crop is very heavy the tedder is a valuable machine, but under most conditions if the hay is put in the window with a side delivery rake when wilted and turned once after the top is dry it will cure out nicely and can be put in the stack or barn the second or third day. Some prefer curing in the shocks, and when this is done it may be put in rather small narrow shocks that will let the water down or rather tall stocks and covered with muslin hay caps. These caps are made of heavy muslin forty to sixty inches square and a small weight attached to each corner.

After the hay is well cured it may be stacked, baled or put in the barn. Remember this, that you can put greener hay in a tight barn than you can in a stack. When a large quantity of wilted hay is put in a tight barn the heat will dry it out and it will come out a nice brown hay, but we think it is safer and a better quality of hay is secured by letting the hay thoroughly dry in the windrow or shock. Where it is stacked in the field the stacks should be protected with slough grass or some kind of stack cover because alfalfa, like clover, does not turn water well unless the stacks are covered.

In concluding this article just let us remind our readers we have not tried to tell the whole story but have tried to put a few facts before you of a crop that is destined to become one of the best paying and most useful crops on Missouri farms.

PRACTICAL EXPERIENCE WITH ALFALFA

My first seeding of alfalfa was made in the spring of 1900. We secured a good stand, and it started off nicely, but made little growth later in the season, and by fall was not very thrifty. During the following winter, Dr. Hopkins told me of the results at the experiment station from inoculation with Kansas alfalfa dirt, and I had a few hundred pounds of alfalfa dirt shipped me from the experiment station in the spring. This was applied to the alfalfa field in the spring except a small portion of the field which was left without dirt treatment for sake of comparison. By fall the alfalfa on the part that was left untreated with dirt was all dead, but the rest of the field cut about four tons of hay per acre. This field remained in alfalfa for seven years and averaged five tons of hay per acre annually.

Later seedings have been made in August or early in September. Have seeded clover stubble, oat stubble and potato ground with about equal results. Ground is plowed as early as possible, and is afterwards disked every few days till ready for seeding. Before seeding, the field is gone over with manure spreader loaded with some manure in the bottom, on top of manure is spread enough limestone to make a ton or more per acre, and on top of the limestone is loaded enough dirt from old alfalfa field to make a few hundred pounds per acre. If sweet clover dirt is more convenient we may use that instead of alfalfa dirt. This distribution is immediately followed with the disk to get the inoculated dirt incorporated with the soil.

The amount of seed sown depends somewhat on the quality of the seed. I have usually used about twenty pounds per acre. The manner of covering the seed is dependent on the conditions. Sometimes it is covered by running a smoothing harrow over the ground several times, and sometimes it is covered by running the disk not very deep.

I think many alfalfa fields are injured by cutting too soon. It is a good plan to wait each cutting till there is quite a development of new shoots from the crowns and a general appearance of ripening has commenecd. It is difficult to tell just how an alfalfa field should look when ready to cut, and it will require some experience to learn it, but as a rule it will pay you to wait a few days after you first think it is ready for harvest. I have more than once severely injured the plants in part of the field by cutting too early. When alfalfa is ready to cut, it should be cut regardless of what the weather predictions may be.

I have tried several different systems of making and curing alfalfa hay, and the system that is most preferred is to use a side delivery rake and to cure in the windrow. This method seems to reduce the weather injury to a minimum and is an economical way of handling hay. A hay loader of the revolving type is used to load the hay on the wagons. Any other type of loader will thrash the leaves off the hay if it is dry enough for the mow. With the side rake the windrows are made only medium size, and if a shower should fall on the hay the side rake is immediately used to shake up and turn over the windrow, giving the hay a chance to dry out quickly. It is also an advantage to turn the windrows each morning as it permits the hay to dry out more uniformly. To get the best quality of hay out of the barn it should be very dry when it goes into the barn. There is no system that will cure good hay at a time when it rains every day as some times happens, and we have practically lost two or three cuttings in last ten years. Even though the hay is in good cocks with caps the hay is considerably injured at such a time, from atmospheric humidity.

How long a seeding of alfalfa should stand will vary somewhat with different conditions. If old ground where June grass has not grown for many years and the alfalfa has not been treated to a coating of manure made from June grass hay or pasture, the alfalfa may remain almost free from grass for eight or ten years. But if grass is in the soil or the seed gets started in any way it is likely it will be but a few years till the June grass has possession and it is time to plow it up and seed a new piece. June grass or bluegrass seems to be the only plant that will run out alfalfa. Frequent disking is a partial remedy against grass, but in the end the grass wins out.

As a gleaning crop alfalfa probably has no superior. When land that is badly infested with crab grass, foxtail, pigeon grass, horse nettle, swamp smart weed, heart's ease, sand burrs, velvet or button weed, running vines of any kind, and many other weeds, is kept in alfalfa for a few years the weeds gradually disappear.

As a feed alfalfa is superior to clover. The writer has many times changed the feed of milk cows from good clover hay to alfalfa with always an accompanying increase in milk yield, and when the change was made from alfalfa to clover it has been followed by decline in milk yield.

Have heard it said that alfalfa would injure ground for other crops to follow, but we have grown the following crops on land that stood seven years in alfalfa. It was given a good application of phosphate before sowing the alfalfa and again before plowing the alfalfa stubble. First year after alfalfa, 20 tons of corn silage; second year, 115 bushels corn per acre; third year, 88½ bushels oats per acre; fourth year, 52¼ bushels wheat per acre.—Frank I. Mann, before the Illinois Alfalfa Growers Association.

Remedy for Melon Aphis

The results of spraying experiments at the Nebraska Agricultural Experiment Station show that tobacco washes are the safest and most effective applications for the little green or black plant lice or aphids destructive to melon and cucumber vines. If a tobacco extract is not readily obtainable, a good solution may be made by dissolving one and one-half pounds of soap in one gallon of water, adding two parts of strong tobacco decoction and diluting it to make five gallons. The tobacco decoction is made by steeping tobacco stems in water until the decoction becomes the color of strong coffee.

Doing Business with a Business Concern

The business man is an important factor in your daily life and happiness.

He may raise wheat or cattle; he may manufacture flour or shoes; he may run a grocery or a dry-goods store; he may operate a copper mine or a telephone company. He creates or distributes some commodity to be used by other people.

He is always hard at work to supply the needs of others, and in return he has his own needs supplied.

All of us are doing business with business men so constantly that we accept the benefits of this intercourse without question, as we accept the air we breathe. Most of us have little to do with government, yet we recognize the difference between business methods and government methods.

We know that it is to the interest of the business man to do something for us, while the function of the government man is to see that we do something for ourselves — that is, to control and regulate.

We pay them both, but of the two we naturally find the business man more get-at-able, more human, more democratic.

Because the telephone business has become large and extensive, it requires a high type of organization and must employ the best business methods.

The Bell System is in the business of selling its commodity — telephone service. It must meet the needs of many millions of customers, and teach them to use and appreciate the service which it has provided.

The democratic relation between the customer and the business concern has been indispensable, providing for the United States the best and most universal telephone service of any country in the world.

NEED OF LIME ON MISSOURI SOILS

One might think from all that has been said in the agricultural press and in many experiment station circulars about liming that lime is the panacea for all the ills of the soil. Few subjects have received more popular attention during recent years. There is little doubt that the benefit to be secured from liming in Missouri has been somewhat over-emphasized by this propaganda, coming as it has quite largely from the eastern states, where the need of lime is much greater than it is in the states farther west. Missouri is slowly coming to resemble the eastern states in certain particulars of agricultural practice, however, and one of these is in the use of lime. The last five years have seen a steady and rather rapid increase in the use of ground limestone on the soils of this state and doubtless this increase will continue. It is one of the phases of an intensive agriculture which is slowly gaining ground as our soils become older.

According to the investigations of the experiment station, the soils which need lime most in Missouri are the level and gently rolling prairies of north central and northeast Missouri, the gray prairies of southwest Missouri and the more worn timber soils of the border Ozarks and the Ozark uplands. Those soils which need it least are in general the bottom soils, the better limestone soils, the brown loess along the Missouri River hills and the prairies and timber lands of northwest Missouri. These statements are, of course, general and represent only average conditions. As a matter of fact, the need for lime varies considerably even on the same soil type, this variation depending much upon conditions. In general the more worn the land the greater the need for lime. In fact, all agricultural lands sooner or later require the application of lime unless both the soil and the subsoil were originally supplied with very large quantities of lime carbonate. Since the soils of Missouri in their virgin state had a very wide variation in lime content, not all corn lands in the state need liming, although as a general rule they do.

Use of Ground Limestone

The return to be expected from the application of lime depends mainly upon the degree of acidity of the soil and the amount of lime applied. In most cases in Missouri use is being made of ground limestone rather than the burned lime, or slaked lime. In general it can be said that it is best to apply at the first application a little in excess of the amount of ground limestone required to sweeten the surface seven inches of an acre and then follow with a ton of limestone or its equivalent in four to six years. This occasional application is necessary when a soil has once become acid, especially in both soil and subsoil. A single liming, unless in large excess, will not keep the land sweet for more than five or six years. As an average of all the experiments conducted by the station on the experiment fields over Missouri, the gross return on the basis of a four-year rotation of corn, oats, wheat and clover has been $5.30 for the application of of approximately one ton of ground limestone. The cost of this limestone applied to the land has been figured in these experiments at $3 a ton, so that on this basis a very satisfactory percentage return has been secured, although not a very large total acre return. This, however, is an average for all the experiment fields representing a number of soil types, most of which needed lime. Naturally there has been a considerable variation from the return of the different fields, depending upon the degree of acidity of the soil. In some of these experiments it was found that an insufficient amount of lime had been applied to entirely correct the acidity of the surface soil. Consequently these figures are subject to probable alterations in the future since larger quantities of lime are now being used on practically all the fields. Where the soil is completely sweetened by the first application it would seem that the return should be increased. There is little doubt, however, that the figures given will be a fair average for the return to be expected from the application of from one to two tons of ground limestone on the lands of Missouri which need lime. The figure of three dollars per ton as the applied cost of ground limestone seems a safe one in most cases. As a matter of fact, it can be applied at a considerably less cost in many cases, which would consequently increase the net return.

Lime a Soil Sweetener

The effect of lime on the soil and crop is a very important consideration. Most men who write to the experiment station seem to have the idea that lime acts in the same manner as a fertilizer, by giving a quick stimulus to plant growth. This, however, rarely happens. In the case of fertilizers, available plant foods are applied and if the soil is lacking in these plant foods, as is usually the case, the result is an immediate effect upon the crop. In the case of lime, it is not added as a plant food since practically all soils contain sufficient lime to meet the plant food requirements of cropping. It is applied merely as a soil sweetener to correct a sour or acid condition and thus put the soil in a more sanitary or healthy condition for the growth of plant roots and of beneficial bacteria. It is therefore not used for immediate returns on any particular crop as a rule, but is applied in a sour soil at the most convenient time in the rotation and a general betterment of yield can be expetced. It is rare that one can see by the eye any particular response from its use on cereals, although in the case of clover, striking results are often secured.

The effect on the individual crop is quite variable. Some plants are little affected by a sour condition of the soil while others are greatly affected. As an average of all the experiments conducted in Missouri the largest money return has been secured on clover, with the returns from other crops ranging in the following order: Corn, soybeans, oats, wheat, cowpeas. Alfalfa has not been used on these particular experiment fields, but other experiments have shown it to be strikingly injured by an acid soil unless the soil is very fertile. The small return from liming cowpeas is rather remarkable since as a rule legumes are much more affected by liming than are the cereals. This beneficial effect is supposed to be due to the fact that the nitrogen fixing bacteria in the nodules of legumes are injured by a sour condition of the soil. In the case of cowpeas, however, the particular type of bacteria concerned seem to be little affected by this sourness, or if so, the plant is able to counteract it, so that cowpeas can be grown very satisfactorily on lands which are quite acid.

Lime Only One Requirement

Since clover and alfalfa are both strikingly injured by a sour soil and therefore most largely benefited by the application of lime, this does not mean that liming is the only requirement for the production of either of these crops. There seems to be a general impression among farmers that liming will enable these crops to be grown on practically any soil. Unfortunately such is not the case. The use of lime where the soil is sour is only one of the requirements for clover or alfalfa growing. Thorough drainage, and, in the case of alfalfa particularly, a reasonable amount of fertility, are just as important, to say nothing of the method of soil preparation and method of seeding. Where sourness is the only factor for getting satisfactory crops of clover and alfalfa, however, the application of proper amounts of lime will be accompanied by very satisfactory returns. We have doubtless secured rather an exaggerated idea of the difficulties in growing clover in many parts of Missouri during the recent dry years, due largely to the hot, dry seasons, yet the fact remains that our soils grow clover less readily than formerly. A part of this is due to a gradual decrease in fertility, a part possibly to the development of certain injurious insects and fungous diseases, yet a part is undoubtedly due to a steady increase in soil acidity with the years. Consequently the use of lime will be of much advantage to clover on many soils. As a matter of fact the main value of lime on a soil is to keep it sufficiently sweet to enable one to grow all legumes satisfactorily, thus making it possible to build up the soil in its organic matter and nitrogen.

There is a direct relation between the system of farming and the use of lime. In general, lime is used with the greatest profit under intensive systems of farming where the soil is being maintained or built up in fertility. Under systems of extensive farming, however, where the land is handled more or less carelessly, the return from lime is usually less. Nevertheless, in the development of profitable systems of agriculture under the changed economic conditions of the Corn Belt states, the use of lime is one of those cheaper soil treatments on which a large percentage return is secured for the money invested, where lands are handled with a fair degree of care. In a future article I hope to discuss the methods of handling lime and of applying it to the soil.

M. F. Miller, Agricultural College.

Clover on the Bowling Green experiment field. It was necessary, both to increase the fertility and to reduce the sourness by adding limestone in order to produce this crop of clover.

HANDLING THE SMALL GRAIN CROP

What I shall have to say in this article will have to do largely with the handling of the winter wheat crop in the Corn Belt states, yet the suggestions apply with equal force to the handling of oats or barley grown in the same district or territory.

In many portions of the West the universal practice is to head their grain and the danger from damage by wet weather after harvest is not so great. In the spring wheat regions owing to the large acreage they are not expected to follow the same methods as the wheat grower who follows diversified or live stock farming.

The very first step in the logical order of procedure in handling the small grain crop is, of course, the time to cut the grain, and upon this subject very little need to be said.

No small grain crop should be cut too green. It should be fully ripe but not what farmers call dead ripe. If cut too green or immature the result will be a shrunken or shriveled grain lacking in nutrients and grading qualities. If allowed to stand too long in the field before cutting it will become more or less straw fallen; the straw becomes weak and will go down before a hard wind or rain storm. The loss from shattering will be increased and the grade will not be so high. Wheat can be cut greener than oats. There are fewer blades or fodder on the wheat and it will not mold under the band when cut just a shade green, like oats. Oat straw is worth more, pound for pound, than wheat straw for feeding farm animals and any straw that has moulded badly under the band has lost much of its feeding value.

The cutting of the small grain includes shocking, and this is one of the very important steps in carefully harvesting a small grain crop.

Good Shocks Save the Grain

Much grief and great injury can come to the small grain crop while in the shock, though it might remain there but a short time.

The base of the shocks should contain twelve bundles, set up in such a way as to form a circle, the heads well drawn together and covered with two nice bundles thoroughly broken and placed in such a way as to give the greatest protection to the grain beneath.

These top bundles or caps prevent the hot sun from bleaching both grain and straw and occasionally a big loss from hail. Oftentimes have we all, as farmers, gone from field to field in helping the neighbors thresh, and observed the great value of the well built shock properly capped as compared with the down shock uncapped—with its sprouted and malted grains.

Now we come to the oft-debated proposition: "Shall we stack our small grain or thresh out of the shock?"

My practice has been to stack and my observations have taught me that whenever at all possible this should be done. I never recommended this practice to an audience of farmers but what some one comes at me with this pertinent question, "Who will do

the stacking for us? Here let me suggest to the agricultural colleges and the conductors of short courses and agricultural extension workers that here is a golden opportunity to restore what has become to be, in the many communities, a lost art—the art of stacking small grain.

Ozark Farmers Are Good Wheat Stackers

Last August I had an occasion to spend a week in one of the farm adviser counties in the Ozarks, one of the banner wheat growing counties of this section of the state. In writing up the six days' campaign for the local papers I had this to say:

I have traveled in a great many states in farmer's institute work, and in many of the almost exclusively wheat growing states and it is my honest conviction that I have never been in any section or district where the wheat crop was more intelligently care for, and, let me add, in a more business-like way than in this county (Green County).

I am positive that after going into almost every school district in this county I never saw one single field of small grain in the shock. Much of the wheat and oats was yet unthreshed. All of this to a bundle was in well built stacks and ricks. I remarked to these farmers that the man that could build a grain stack as these were built was as true an artist as any painter or sculptor that ever painted a picture or carved a bust that sold for thousands of dollars; and to the great struggling mass of toiling humanity in their scramble for bread such harvest field artists are of vastly more importance.

The wheat and oats and other small grain threshed from these stacks will grade higher, and remember that grain is bought and sold on grade. The better the grade the higher price your grain will command on the market and the higher the price the greater the profit. For this is fundamental, if you increase the selling price without increasing the cost of production you increase the profit. The grain is not all that is benefited. The straw tucked away in these well built stacks or ricks from the sun, the rain and the dew, comes out as bright as a new Leghorn hat.

This, one of the by-products of the farm, has but very little cash value when put on the market, but when fed in connection with alfalfa, clover hay or succulent ensilage, fills the animal's stomach, produces heat and energy, and in this way can be made to take the place of other feeds that command higher prices.

When you stack your grain it goes through a sweat and will show an improved berry and will keep better when stored in the bin.

Stacking Lessens the Work.

his own time and the time of his teams when he stacks, and the threshing bill is not as large. The cash outlay is much smaller. He can turn in hogs and sheep to glean the stubble fields before he begins to plow for the succeeding crop.

When you thresh out of the stack you lessen the work of the women folks to a very great extent and this should of itself be an inducement, of no small degree, to stimulate the farmer to stack his small grain.

If the State Board of Agriculture, all farm papers, the agricultural colleges, the teachers in the schools in Missouri could persuade the farmers to properly care for the thousands of strawstacks within her borders, they would save the state untold sums of money. Thousands of these strawstacks are left sprawled out on the ground to rot just as they fell from the stacker.

What would you think of your neighbor if he would buy enough paint to paint his house or barn, take a paint brush and never stop until he put the last ounce on a space three or four feet square?

That is just what the farmer does and even worse, when he allows a big straw stack to rot as described above.

Then let us handle our small grain so as to improve the grade, increase the price and thus obey the divine injunction: "Gather up the fragments that nothing be wasted." Frugality and economy, intelligently practiced during seasons of prosperity, will lessen if not altogether banish the painful necessity of buying high priced feeds shipped in from other states during short crop years when every dollar of the money thus spent is so much needed at home.

W. D. McKee,
Farmers' Institute Lecturer, Polo.

WILL CROP ROTATION MAINTAIN SOIL FERTILITY?

The term crop rotation as used by the writer means any systematic succession of different crops. It is quite possible to have a good rotation or a poor rotation. Corn followed by oats year after year would be a crop rotation, but it would ordinarily be a very poor one. It is likewise possible, through improper management, to fail to realize the full benefit that should result from the use of a good rotation.

It is the purpose of this article to state some of the established facts, based on long continued field experiments, bearing on the question of whether a good crop rotation will in itself maintain the crop producing power of the soil.

It is a matter of common knowledge that crop yields are materially increased when a good rotation is established on a previously non-rotated farm. Farmers often look upon crop rotation as a panacea that will solve all soil fertility problems. This fallacy is based upon the observation that crop yields are increased, often very remarkably, by a good rotation. The assumption is then made that this increase in yield will continue indefinitely and that the soil is being "built up."

Farmers, who as a class know very little about the chemistry involved, are not the only ones who make this assumption. Certain investigators in the Bureau of Soils have arrived at the same conclusion, basing their conclusions largely upon laboratory investigations. James J. Hill, the great railroad man, maintains that crop rotation will indefinitely maintain the crop producing power of the soil.

The only safe way to answer a question such as this is to turn to the reported results of long continued field trials. The most valuable are afforded by the Rothamsted Experiment Station and the Pennsylvania State College Experiment Station.

The most conclusive figures available touching this problem are those furnished by the Rothamsted Station. Where wheat was grown continuously on Broadbalk field with no fertilizer treatment the yield of the first thirty-two years was 14.8 bushels and for the second thirty-two years 11.4 bushels, a decrease of 22.3 per cent. On Hoos field where wheat and fallow alternated the yields were 21.4 bushels and 14.7 bushels respectively for the two thirty-two year periods, or a decline of 31.3 per cent. A four year rotation of turnips, barley, fallow and wheat on Agdell field gave a yield of 30.2 bushels of wheat for the first thirty-two years 24.5 bushels for the second thirty-two years, a decrease of 18.8 per cent. A four year rotation of turnips, barley, legume and wheat on Agdell field gave a yield of 28.1 bushels and 23.6 bushels respectively for the two periods, or a decline of 16 per cent.

The above figures are conclusive because of the length of time involved and the grouping into two thirty-two year periods does not bring out the rate of decline in yield as strikingly as might be done by other arrangements.

The Pennsylvania Station furnishes some valuable data bearing upon this same point which should be familiar to all students of agriculture. The following figures show average yields of twenty unfertilized plots for two twelve-year periods.

Crops	1885-'96	1897-'08	Decrease
Corn bu.	41.7	27.7	14.0
Oats bu.	36.7	25.0	11.7
Wheat bu.	13.3	12.8	.5
Hay pounds	3070	2180	890
Av. value	$11.05	$8.18	$2.87

The above figures show a decrease of 26 per cent in crop values comparing the first twelve year period with the second. The soil upon which these plots are located is a limestone soil but nevertheless the yeild has decreased in twenty-four years to a point where the crops cannot be produced at a profit. All reliable data points to the same conclusion as shown by the Rothamsted and Pennsylvania data; namely, that it is folly to expect crop rotation alone to maintain the crop producing power of the soil.

The experience of the older agricultural countries as well as our own should teach us that a good rotation system is one of the essentials in farming. The truth should be equally clear that to neglect to return to the soil those elements of plant food in which it is deficient or likely to become deficient means a steady decrease in yield. What these elements are and the form in which they should be returned are problems that belong to the field of Soil Fertility.

There are other fallacies that are often urged as reasons why farmers should more generally adopt systematic rotations, but the writer considers the one discussed above as being the most serious because of its close bearing upon the adoption of profitable and at the same time permanent systems of agriculture.

R. S. Smith,
Pennsylavnia Agricultural College.

We believe the study of soil fertility is the very first for every farmer's consideration. Without a fertile soil there can be no profit in farming and without profit the business must decline. It is well to know something about plant food in the soil and about the best and most profitable rotations, but that is not all; we must study drainage and cultivation as well as adaptability of various crops to our soil and climate.

The drouth is ended.

—o—

If you get a little bit worried about having too much rain just turn over a leaf and think how much worse it would have been without any more rain than we had last summer.

—o—

Reports are coming in now that the wheat is not nearly so badly injured by Hessian fly as the first reports indicated. The rains came just in the nick of time to check the chinch bugs and to help out the oat crop and the meadows and pastures. With a good crop and good prices farmers ought to get a fair reward for their labor this summer.

—o—

The man who is trying to raise hogs without some forage crop for pasture is not getting the profit he is entitled to. In what other way can a man make an acre of land pay better with so little expense as to sow it in rape, clover or alfalfa and turn it into 500 to 800 pounds of pork without any expense for harvesting? The old method of dry-lot feeding hogs is out of date and worse is out of pocket for the fellow who follows it.

—o—

On May 25 we cut a sample of alfalfa from a field of Missouri hill land that measured 38½ inches and we think the field would have averaged 36 inches high. The hay on that field ought to yield two tons the first cutting and five or six tons of dry hay for the season. True this land had been well manured but there is surely good money returned for any crop that will give even four tons of good hay to the acre. Well can any farmer afford to put 8 or 10 loads of manure and 300 pounds of fertilizer to the acre, at least for a small field that will yield so much feed, and any one can do it who will.

—o—

RURAL CREDIT PETITIONS

The Missouri Farmer has received quite a number of requests from farmers for blank petitions to circulate in the interest of the Gardner Rural Credit Bill. These blanks will not be ready for a few weeks yet but just as soon as they are ready we will supply all those who want them with blanks. Our readers understand that the Gardner Bill passed the Legislature almost unanimously and was at once approved by the Governor, but before the law can become effective it will be necessary to submit a constitutional amendment by initiative petition. These petitions must come from at least eleven of the sixteen congressional districts, but if every farmer interested will see that a petition is circulated in his neighborhood it will not be difficult to get the required number and the circulation of the petitions will cause a discussion that will be beneficial.

—o—

BANKERS AND RURAL CREDITS

The Missouri Farmer has for a long time believed that farmers were in need of better credit facilities and we are pleased to know that this sentiment is meeting with the approval of many bankers who are willing to join with the farmers and others to help put the Missouri rural credits bill into effect. The St. Louis Banker, which no doubt reflects the sentiment of a majority of the bankers of the state, commenting on the subject in the May number had this to say: "Col. Gardner's land bank bill was passed late in the session and was signed by the Governor without hesitation. As soon as the people can vote on the necessary constitutional amendment to validate some features of the new law, it will go into effect. Then, for the first time in the history of the state, a farmer will stand on a basis comparable with that of a small merchant or manufacturer. His credit will depend on his resources, on his presumable turn over, on his assets, on his receivables, and on his character. With the excellent system of safeguards embodied in the law there are no possible abuses in farm credits. The amortisement plan provided is equitable and sound. The relief afforded to worthy men in the farm industry will be very welcome. There can be no doubt that the law will stimulate agriculture in a marked measure. Col. Gardner deserves the thanks of the state."

We are glad to see this spirit of fairness manifested,and why should it not be so? Long time farm loans is not a proper line of business for the bank any way, and if a better system of rural credits is any benefit to farmers all others must of necessity share in the benefit because agriculture is and must always be our basic industry.

In this connection we want to urge our readers not to become confused in a discussion of other systems that might be adopted either by the state or by the Federal government. This plan which has been fully explained in our columns is sound and equitable, will give farmers money on long time at a low rate of interest, will not cost the state a cent and if the constitutional amendment is adopted at the next general election in November, 1916, this law will go into effect at once. The adoption of this plan by Missouri will not in any way interfere with any plan the United States Congress may adopt for the country at large.

This law does not show any favoritism to farmers as a class, but it merely furnishes the necessary safeguards and official machinery whereby farmers can use their credit to better advantage. It is doing no more for farmers than the state has long since done for bankers and business men in the enactment of our banking laws. The inauguration of this system will make available needed capital for thousands of farmers for improving their farms, for stocking up with a better class of animals, for draining our swamp lands and clearing the timber lands, all of which when brought about ought to make a prosperous era in this state.

A DOLLAR'S WORTH

We have always maintained that the greatest handicap in the way of getting the people to vote money for road improvement was the waste of road funds. Considerable money is now raised for road work but much of the work is so poorly done that it is soon all to do over again and the people are tired of that kind of improvement. A few days ago we had occasion to travel over a newly made road which had cost the taxpayers several thousand dollars a mile, but from present indications inside of two years this road will have to be built all over, at least it will have to be resurfaced. This road which has been surfaced with crushed limestone and put on without a binder has already after only a few months travel cut into deep ruts like a dirt road and the limestone is grinding into dust and is washing and blowing away. The most disagreeable trip we have made in years was over this high priced road on a windy May day.

It is generally agreed among engineers, we believe, that a crushed rock road without some form of oil binder is a failure for automobile traffic. In the face of this information we suppose some of our road commissions will go right on building roads in the same old way, wasting the hard earned money of the people. Perhaps a few costly mistakes of this kind will open our eyes to the fact that road building is a science like many other things and we will not be content for men to play at the game unless they really know their business.

—o—

GOOD ROADS DAYS

The example set by Missouri of fixing two days when all the people of the state were called upon to lend their aid and support to building good roads and to creating a better sentiment for good roads was so generally approved that the Governor has by proclamation set aside June 15 and 16 of this year as good roads days. The time set is decidedly better than the late date last year and we urge the farmers in every road district to observe these days in improving the neighborhood roads. Nothing speaks better for the progress of a community than to see the roads well rounded up, smoothed over with a drag, substantial culverts made of stone or cement and the road side cleared by weeds and brush.

This year more than ever before Missouri has the opportunity of making a favorable impression on thousands of tourists who will pass through the state if we will give them smoother roads to travel. After the preamble of the proclamation the Governor makes this appeal to the people to observe Good Roads Days:

I respectfully call upon the County Court of each county to issue a proclamation such as was issued last year, calling upon the people to come out with proper teams, equipments and materials and labor and see to it that the county is well organized, so work will be given and benefits received in every neighborhood, and the same conducted in a systematic and business-like way, to the end that every section of the commonwealth may be the recipient of actual road betterments.

Again, I call upon the city and country press to assist in organizing the work and in bringing to the roads another army of labor volunteers, such as came forth last year. The press contributed, in a great measure, to the success of the work, and the state is indebted to it for the enthusiastic and earnest support given, and as Chief Executive, I desire to recognize the aid given by both the city and country press in this official proclamation. I also call upon the road overseers, federated and all other road organizations, automobile clubs and associations and all commercial and booster clubs to aid the State Highway Department to again carry forward to a great success, the "Good Roads Days."

I request the women of Missouri to again prepare dinners and see that the laborers are served upon the highways. They contributed much to the success of the work last year, realizing the fact that better roads would bring a better community life and more pleasure to the women who have cast their fortunes in the homes of rural Missouri.

Let every citizen be earnest, enthusiastic and systematic in going about the preparation for work upon these days. No matter whether the work be done upon high-grade roads or upon dirt roads, let it be a permanent improvement. The great majority of the work will be done upon the dirt roads, which, after all, are the real highways of commerce. This is true because the dirt roads represent the first leg of the journey over which moves the traffic of the State. The road enabling the producer to bring more products to the first markets of the country; the road that will save hundreds of thousands of dollars in shrinkage in the delivery of live stock; the road that will lessen that part of the cost of transportation which begins at the producer's door; the road, every tendency of which is to improve community life and make it better morally, civilly and commercially.

Let us, therefore, labor upon the high-grade roads, and upon the improved and unimproved dirt roads, to the end that no material or energy be lost, and the benefits given to a single unit in highway traffic. Missouri is leading the way in this great internal improvement upon which must rest, in the final analysis, the success of every business of the country. Good roads will bring better schools, better agriculture, better community life, better commerce, and a better civilization.

—o—

A GOOD APPOINTMENT

Thousands of farmers who have been entertained and instructed by Sam Jordan's interesting lectures will doubtless be pleased to learn that the state board of agriculture has secured Mr. Jordan's services as farmers' institute lecturer and he will take up his work about September 1. We have never heard a more instructive or inspirational speaker and we are confident there are thousands of farmers who agree with us in this. Three years ago Jordan left the board of agriculture and since has filled the office of farm adviser for Pettis County. How well he has filled that position is told by the following editorial in a Pettis County paper, the Sedalia Democrat:

Sam Jordan has paid Pettis County in dollars and cents every day that he has been here and the dividends from his labors will continue coming in as long as the county exists and a farm is cultivated within its borders, for what he has taught will be passed from father to son, and from farmer to farmer, through all the coming years. It can't be stopped any more than can any other knowledge that has once been given to the human race. It is destined to be sent broadcast, and where taken advantage of and used with judgment, it will continue to pay profits to the end of time. But with all this, in spite of what he has given us and will leave with us for future use, his going will be a distinct loss to the entire community.

It will be a loss for us not to be known as the Sam Jordan county of the nation, to lose the prestige that his name and fame sheds upon that locality with which he is identified in his missionary work of crop improvement. It will be a loss to miss his wise counsel and cheery enthusiasm while giving his advice and teaching his methods, and it will be a loss not to have him here, ready and willing and glad to advise and instruct any and all calling upon him. The Democrat is sorry that he is going, more sorry than it can express, and the only consolation it can find is that Pettis County's loss will be the State of Missouri's gain, and that while we can not hereafter possess his exclusive time and work, at least in the future a hundred and fourteenth part of them will belong to us."

BARNYARD GOSSIP

About two weeks ago I met a thrifty callous-fingered farmer who has gone through forty crop seasons good and bad and the first thing my friend said was, "Say, do you think it is ever going to rain? I am afraid we are going to have another drouth. I just feel it in my bones, some how or other, and I tell you I don't know what will become of us if we have another failure." I replied, "Well we have never had a failure yet in Missouri, not a real failure. If I remember rightly we had a splendid wheat crop last year and farmers who had silos raised enough feed to take their stock through the winter and I know at least one good farmer who had a field of alfalfa who took his cattle through fat and fine and had several tons of hay to sell this spring. Last year was not a big crop year I know but the man who had a silo on his farm and a field of alfalfa came through with good credit at the bank and as for the fellow who has neither a silo or alfalfa —well who's to blame for that?"

—o—

Today I met the same old farmer friend on the street and he accosted me in this way, "Say, Mr. Gossip d'you reckon this rain is ever going to let up? Why, I haven't seen the sun for a week and I'm mighty 'fraid we're going to be drowned out just like we were in 1903. I tell you I'm mighty glad I'm not in your friend Robinson's fix. Why you know he has gone alfalfa crazy and he has a hundred acres of the bloomin' stuff on his farm and he only got about half of it cut before the rain set in. Why, he stands to lose half his crop. Fifty tons of hay I should say he'll never get a cent out of!" "Well, that's too bad," I said, "but then I happen to know Robison has already got a lot of good from pasturing that alfalfa with his hogs and if he must let the other go down to enrich the land and with fifty tons already in the shed and two or three more cuttings promised for the season he will come out smiling after all."

—o—

Many years ago I learned it was a bad thing for a man's digestion to worry about the weather. When I was a boy an old friend of my father said to me, "It's a fool who worries about a thing he could prevent and a bigger fool who worries about something he can not present." The philosophy of it is to do the best you can and then not worry, fret and stew around about something you have no power to control. I would not have our readers think I had always escaped disappointment. No, not that, for I have had a big mortgage hanging over my farm and had a fine bunch of hogs die that I was expecting to help pay the debt. I have had my horses run into the wire and cut their legs nearly off. I have seen the hot winds and chinch bugs wilt my corn like a prairie fire. I have had the wind storm pick up my grain stacks and scatter the fruits of a year's labor and make feed for the birds. I have had a hail storm to destroy in thirty minutes the labor of half of a summer. Oh, yes, I have had disappointments but I have learned long ago that it is best to keep your disappointments behind you and instead of borrowing trouble look to the future with a confident hopefulness that the sunshine and the rain and good crops will come in the future just as often as they have in the past.

—o—

I sometimes think we give too much attention to the material things of this life and too little attention to our intellectual improvement and to the spiritual welfare of our families. For what profiteth it us if we gain a township of land and have our boys and girls grow up without aim in life? After all the greatest crop we produce on our Missouri farms is the product of the farm home—the intelligent moral boy and girl. I can not do better than to quote here some fine suggestions to the fathers of boys recently given by J. C. Hogenson, state leader of club work in the State of Utah:

"When that boy of yours was born," says Mr. Hogenson, "when you looked into his wondering eyes for the first time, you were a very proud and happy man. Is it not so? Can you ever forget the day? I can't. To your friends you seemed an inch taller or at least half an inch. You had a smile on your face that no one could mistake; your shoulders were straighter, your handclasp firmer and more cordial. It would be a very ill-natured man who would pick a quarrel with you that day, or even on the day after. The proud mother folded the boy to her breast, the fountain of life for it, and felt that through the very gates she had entered into a larger life, and had full and abundant recompense for all her suffering. You felt just a little different towards her, and she towards you than ever before. There was a new and intimate bond between you now. You really felt, and so did she, whether either of you said so or not, that he was altogether the finest and most remarkable baby that ever was born.

"Well, the boy has grown up. He is now in long pants, and is particular about his neckties and the cut of his clothes, and you have been studying him all these years. You have been wondering what you were going to make of him, or rather, what he was going to make of himself. Whatever that may be you are anxious to get him started right.

"A right start means more than many realize. It means a sound body; it means an active mind; it means good habits, and it means a preparation for the life work for which he is best fitted. If you have fed him with plain wholesome food, if you have set before him a good example of high ideals, if you have trained him to habits of industry and economy, the rest is comparatively easy. If not, you and his mother have a hard task before you; for these are the very foundations of character.

"If your faults or those of his mother—and we are all faulty—begin to reappear in him, don't blame him, but do your best to help him overcome them. Other boys and girls have come into your home—at least I hope so—and without being conscious of it, have helped in the training of the boy. You are really anxious to know how to do best for each of them, and to do more for all of them.

"They cannot all be farmers or farmers' wives. There are too many of them for your acres; but you want one, at least, to be a farmer, and the problem is, how you are to start him, and all the rest of them right. From one point of view the most important part of the boy is the head, and if we get the head started right the rest will follow. The most important lesson for the head—and this should be inculcated from the very beginning—is that you are all one family, the most important co-operative organization that ever was formed. The slogan for the family should be: Each for all, and all for each other. In the battle of life, the members of the family must all stand together, if need be, help each other against all the world. This will greatly simplify matters when you come to find out what each is adapted for; for all will join in giving the right start.

"The farm boy is pretty apt to regard farm work as drudgery. Well, don't be a drudge yourself. The way to transform drudgery into pleasure is to get the mind interested in the work you are doing, not the attention merely but the mind itself. Get interested in the laws of nature, which rule in such things as digging ditches, hauling out manure, milking cows; for example how water gets into the ditch from the side, or from below; why manure is more efficient in some soils than others; why cows give more milk on some kinds of feed than others. No matter whether the boy is to be a farmer, a lawyer, a doctor or a business man, this kind of training will be a mighty help to him in after life.

"No mental equipment, however, will start the boy right, unless he has right ideals; and these are the result largely of the home and home training. If you have not taught your boy from childhood up to reverence his mother, and be a guardian and protector to his sisters; if you have not taught him that it is his duty to give everyone a square deal; if you have not taught him to be honest, not because it is the best policy, but because it is everlastingly right, the mental equipment you have given him in the school or college, or that great school, the farm, will not start him right. For important as the boy's head is in fitting him for life, the heart, his ideals, his attitude toward his God and his fellowman are far mort important."

A Fascinating Pastime

Is there a good kodak in your home? Do you know that modern photography has been so perfected that, with a little practice almost any one can take good pictures? It only costs a few dollars to buy a good kodak and there should be one on every farm—for these is no end of good pictures to be taken. What more fascinating pastime than to take a picture of the family group, a toddling baby in the front yard, the live stock out in the pasture, harvest scenes, etc.? Often farm papers would be glad to use pictures of this kind if they could get them. Elsewhere in this issue you will find the advertisement of the Eastman Kodak Co. Drop them a postal card and ask them to send you full information. Be sure to mention The Missouri Farmer.

Little Girls, Attention!

We have made arrangements to offer as a prize to the little farmer girls in whose homes The Missouri Farmer is a visitor a "Little Sister Doll." This is a new kind of doll which opens and shuts its eyes and which looks more "cute" than any other doll our little girl friends ever saw before. It is called the "Little Sister Doll" and is having a great reign of popularity in the towns and cities just now. If you want a "Little Sister" write us at once for the full particulars when we will tell you how you can get one. We would like to send one to all our little girl friends. Write today.

The Missouri Farmer, Columbia, Mo.

OF INTEREST TO FARMER GIRLS

For every bright and ambitious farmer girl in Missouri who would like to have a beautiful piano all of her own The Missouri Farmer has a mighty interesting message. We don't ask you to engage in any "contest." Furthermore, the pianos we offer are of the highest quality and beauty. We cannot go into details here. All we will say now is that if you would like to own one of these beautiful instruments all through your own efforts, write The Missouri Farmer at once. **I appeal to every good housewife who reads this paper to bring this matter to the attention of at least one bright and ambitious farmer girl in her community.**

—The Author of After-Thoughts.

DOUBLE TREAD TIRES

Guaranteed for 3500 Miles

Every well-known tire manufacturer feels that he has to maintain a certain standard of *appearance.* So in the factory inspection, the slightest irregularity, a bruise, or even a scratch, will prevent a sound, honest tire going out as first stock.

These high-class tires are bought by us, and we utilize them for the best real tire value you can buy. We combine each shoe with the perfect bead of another tire, and thus give you a doubly-constructed tread, with twelve layers of fabric, and one inch of service rubber.

Doutré (DOUble TREad) Tires are "Handsome is as Handsome does." They will stand up under the hardest service, as guaranteed.

Look for our DOU-TRÉ Trade Mark. It will save you 75% on your tire bills.

Read these prices and be-convinced:

Size	Plain	Non-Skid	Pure Gum Tubes	Red Tube
30 x 3	$5.00	$5.50	$2.35	$2.60
30 x 3½	6.00	7.00	2.70	3.00
32 x 3½	7.00	8.00	2.80	3.10
33 x 4	9.00	10.00	3.90	4.35
34 x 4	9.00	10.00	4.00	4.45

Also all sizes up to 38 x 5½. State whether clincher, "Q. D." or straight side.

Address Dept. Mo. F

The Double Tread Tire Co., Inc.

106 West 52nd St., New York City

NO CLIMBING OF TOWERS IN OURS

Every bearing is constantly flooded with oil. Two quarts of oil in the gear case of the 8-foot Auto-oiled Aermotor will keep the gears and every bearing flooded with oil for a year or more. With its duplicate gears and two pitmen lifting the load straight up it is unbreakable. It runs in a breath of air. The galvanized helmet covers the gears, keeps out rain, keeps out dust, keeps in oil. If you are tired of climbing a windmill tower; if you are tired of buying repairs and having them put on; if you are tired of waiting for a big wind, let us furnish you this self-oiling, ever-going mill to go on any old tower. It costs but little and you will get the difference between no water in a light wind and an abundance of water in almost no wind. Write

DUPLICATE GEARS RUNNING IN OIL — Oil Annually — EVERY BEARING FLOODED WITH OIL

Aermotor Co., 1146 S. Campbell Ave., Chicago

Lightning Can't Strike if Shinn Gets There First

Illustrated Book on Lightning free. Explains cause and tells what kind of rods will protect your building. W. C. SHINN, 141 No. 16th Street, Lincoln, Nebr.

Get This Book FREE

Tells how you can now grow mushrooms at home in spare time, in cellar, barns, sheds, etc. Spawn now produced by scientific methods makes crop certain. Small beds which cost little to start often produce $40 to $60. No experience necessary. I tell you how to grow. My instructions, based on 20 years' experience, used in State Agricultural Colleges. Remarkable opportunity to add $5 to $20 a week to your income.

Do You Own an Automobile?

If you own an automobile you should drop a postal card at once to the Firestone Tire and Rubber Co. at Akron, Ohio, and ask them to send you their latest information about automobile tires. They can save you a lot of money and give you some information which every owner of an automobile should have. Be sure to mention The Missouri Farmer.

Home Makers Conference

This Department is Edited by Miss Alice Kinney, New Franklin, Mo.

STATE OFFICERS

President, Mrs. Harry Sneed, Sedalia.
First V. P., Miss Louise Stanley, Columbia
Second V. P., Mrs. Horace Windsor, Boonville.
Cor. Sec., Miss Bab Bell, Columbia.
Rec. Sec., Mrs. D. H. Doane, Columbia.
Exec. Sec., Miss May McDonald, Columbia.
Treas., Mrs. Ivan W. Phillips, Kingsville.

ADVISORY BOARD

Mrs. N. H. Gentry, Sedalia.
Mrs. Marie T. Harvey, Kirksville.
Mrs. F. B. Mumford, Columbia.
Mrs. R. E. Shryock, Kansas City.
Mrs. J. E. Roberts, Maysville.

"The secret of perpetual youth is hers
Who finds delight in deeds of kindness wrought;
No age can dim the luster of her crown
Whose days with loving ministry are fraught."

SOME POINTS IN BREAD MAKING

In view of the fact of the universal use of bread as the foundation of the diet and that fifty per cent of the bread eaten is made in the home, the ability on the part of the home maker to produce good bread is of the greatest importance. If well made the home product is much to be preferred as it will go one-third farther from the standpoint of nutrition than the same weight of bakers' bread. It is a deplorable fact, however, that on account of the lack of good bread makers, in most cases the bought bread is to be preferred to that made in the home. Thus an effort should be made on the part of every housewife to understand something of the composition, nutritive value and the best means of preparing bread.

In regard to its ingredients, bread is one of the simplest of our cooked foods, but in regard to the changes which the raw material must undergo to produce the finished loaf it is one of the most complicated. Few people realize how much depends upon the proper manipulation of these few simple ingredients in order to get the best results.

The kind of yeast used in bread-making is not important but the condition of the yeast is of the greatest importance. Bacteria thrive upon the same food as the yeast plant, and when the yeast of bread is kept in utensils which are not sterile or is allowed to stand in dusty places, bacteria will be found in the bread and they produce acids which give the bread a sour unpleasant taste. Thus the housewife should endeavor by the most rigid cleanliness to keep her bread free from all micro-organisms but the pure yeast plants, if good bread is to result from her efforts. This is aided by scalding all utensils and liquids before using.

In mixing the dough if the flour is added gradually and beaten into the liquid thoroughly it will incorporate air into the dough and aid the growth of the yeast plants, as air is necessary for their growth. The growth of the yeast plant may also be hastened by adding the necessary sugar to the yeast which is available food for the plant and will aid its growth while it is softening in the lukewarm water preparatory to use. If bubbles or foam do not show after yeast has stood in sugar and lukewarm water for several minutes the yeast is probably old and most of the plants dead and thus unfit for use. This is a good test for the yeast before using.

Care should be taken not to get the dough too stiff, as a harsh, dry, crumbly bread will result. The least amount of flour possible, without having a sticky dough, gives the best results.

In kneading, the quick even stroke counts more than the strength put into it. A thorough kneading gives a bread of better texture by distributing the yeast plants evenly through the dough and thus an even distribution of gas bubbles. Bread may be kneaded too long and the elastic quality completely destroyed. It should be kneaded until it has a smooth velvety surface and gas bubbles begin to appear. This should take place within fifteen or twenty minutes of good kneading. Never knead bread over thirty minutes.

When bread is set to rise, it should be placed in a clean bowl and if covered tightly and the proper temperature is retained, it is not necessary to either oil or moisten the surface to prevent a crust from forming. From 79 degrees to 95 degrees Farenheit, the temperature is safe for the production of the yeast plant. When bread is raised at a high temperature it is apt to make a dark, coarse, sour bred. If it is allowed to chill while rising the volume is smaller and then it will have a runny texture. A temperature which will keep the yeast plants growing steadily is the best. If the yeast is not allowed to lag, there is no danger of the bread souring unless the fermentation is allowed to run too long. Chilling does not entirely stop the growth of yeast but it will cause an undesirable crust to form over the dough. If a very high temperature is maintained dough is apt to get over light which means a very great amount of carbon dioxide gas has been formed, and the yeast will begin to lag and the bacteria will grow in a density of carbon dioxide gas and the yeast will not. The dough will also become soft and runny. So great care should be taken to keep the dough at a gentle warm even temperature until it is about twice its bulk and then work it, and the bread will have a better texture and there will be less danger of sourness.

The baking temperature is also important and the oven heat should be regulated according to the lightness of the dough. After the bread is set to rise in the pans, if put in the oven when the loaf is twice its original bulk the oven heat should be great enough to stop the fermentation or rising at once. A temperature of 360 degrees Farenheit is a good temperature with which to begin. The temperature should be allowed to rise after fifteen minutes of baking and lowered after thirty minutes. The bread should begin to brown over in patches during the first fifteen minutes and have an even brown surface after thirty minutes. If the bread is not twice its original bulk or as light as desired, it may be allowed to finish rising in the oven. The oven should be evenly heated and the rising should take place during the first ten minutes of baking and then the heat increased. When permitted to rise partially in the oven, it will produce a loaf of somewhat larger size and finer texture.

May C. McDonald,
Agricultural Extension Service, College of Agriculture, University of Missouri.

A series of papers on bread making will follow this introduction. Miss McDonald hopes not only to thus furnish information which, she believes, will be valuable for the average housewife but also create interest in the girls' club work.

The first installment begins with wheat flour and ends with the handling of the ingredients in making bread.

The second installment begins with short process of bread making and ending with the lesson on graham.

The third installment begins with the lesson on fancy bread and ends with the lesson on bread sticks and zwieback.

Courses in other subjects are being arranged for this department, thus we hope to be able to give our readers many of the instructions that will be given in the Movable School of Home Economics over the state this summer and in a measure, make good to the many what the few will be privileged to hear in person from trained teachers.

A. K.

EXHIBIT WORK

[Compiled by Miss Louise Stanley of the Home Economics Department of the Missouri University.]

The object of the following is to make more definite the lines between the various groups under which entries are usually made. The scores are given both to facilitate the judging and also to make more definite the standards toward which the women are to aim in any individual case.

While this is intended primarily for use in connection with the annual contest work of the Missouri Home Makers' Conference, it may be used in any contest where similar entries are desirable.

We want this year to make a special feature of our exhibit work. The possibility of material for such exhibits is endless. In order to increase the educational value of such an exhibit and with the idea of standardizing household products for which there is a market, we are this year limiting the contests to those products of the farm home for which there is a ready market, and which are in a form that can be readily transported. It is hoped that by means of a Home Makers' Exchange direct lines of communication can be established between the farm home and the consumer. If this is done we must establish standards up to which the goods must measure.

Definition of Entries and Score Cards

In the canned product we should aim to have the fruit retain as near as possible its original shape and flavor. In the case of canned fruits the natural flavor of the fruit should not be hidden by the use of too much sugar. In general the percentage of sugar used should be the same as that found in the juice of the fruit.

SCORE FOR CANNED FRUIT

Fruit—shape	15
color	15
flavor	30
Juice—flavor	15

JELLY

"Ideal fruit jelly is a beautifully colored, transparent, paltable product obtained by so treating fruit juice that the resulting mass will quiver, not flow when removed from its mold; a product with texture so tender that it cuts easily with a spoon, and yet so firm that the angles thus produced retain their shape; a clear product that is neither syrupy, gummy, sticky, nor tough; neither is it brittle, yet it will break, and does this with a distinct, beautiful cleavage which leaves sparkling characteristic faces." (Miss Goldthwaite, U. of Ill. Bull., Vol. VII, No. VII, Principles of Jelly Making.)

The essential differences between preserves, jams, marmalades and butters is nowhere very clearly defined. Preserves, from the meaning of the word, originally meant the cooking of definite quantities of fruit and sugar, usually equal quantities, to such a consistency that the mass would keep without being hermetically sealed, that is, the concentration of sugar present would be sufficient to prevent the growth of any organisms. In preserves as the name also indicates, an attempt is also made to have the fruit keep as near as possible its original appearance and shape, and the effect of cooking in the sugar solution makes the fruit appear clear. In the preserves we can distinguish two essentialy different parts, the fruit and the juice.

Jams differ from preserves in that though the whole fruit is usually used, it is crushed in the juice so as to produce a homogeneous mixture. As a rule only the small fruits of which the whole may be used, are utilized in jam making, for only in these are we able to use the whole fruit. When we discard the seed and all or part of the skin the resulting product is a marmalade or butter. In a butter the pulp only is used and it is usually strained to remove any lumps and distribute the pulp evenly through the juice. In a marmalade part of the peel or skin may be left in, and there are distinguishable two distinct portions, the clear juice and the particles of fruit.

The test as to when done should be especially in cases where there is any tendency to jelly, the same as for jelly.

Make Farming Pay

We have received from the publishers, The Bobbs-Merrill Company, a sample copy of Benson and Betts' Agriculture, a book intended for the young farmer or student in agriculture and which we find is full of the latest and best information to be had on the subject. While the book seems to have been written primarily for high school work in agriculture, it will be found useful to any young farmer who wants to learn how to raise better and bigger crops, how to improve his live stock and to treat live stock diseases. The book may be had by addressing The Bobbs-Merrill Company, Indianapolis, Ind., for $1.50 including postage.

There is no better place than a good christian farm home for a boy or girl to grow into manhood or womanhood.

THE FATHER

"Do hush your racket, Joe," I said;
"You're only quiet when in bed.
I don't see how your mother bears
Your noise all day: do run upstairs!"

He looked at me, and I at him;
His eyes were wavering and dim,
His lips were set in piteous way,
Forgotten was his mirthful play;
And drooping low his curly head,
He went to find his nurse and bed.

Strange I could neither read nor write;
The room was still, the lamp was bright,
And not a sound above the stair,
And quiet brooded everywhere.
But, I could neither read nor write,
Because I grieved a child that night.

And, sorrowful and penitnent,
Unto his little room I went,
Humbly, as any culprit speeds
To make amend for his misdeeds.
He lay asleep with tears undried,
His wooly lambskin by his side.

His hands were clasped in suppliant way;
And, when his mother went that day
To watch beside a sister's bed,
These were the parting words she said:
"Be tender with my little Joe,
For he will miss his mother so!"

Ah, me, how had I kept my word?
I smoothed his hair, he slightly stirred,
And sleepily one hand outspread
To clasp my own across the bed;
And as I bent to kiss the child,
"Dear papa," murmured he, and smiled.

—E. A. Lente

A SPELL OF REST

My wife has been a-urgin' me t' take a month o' rest,
T' leave my work behind me, an' the troubles that infest,
T' visit all my kinfolks—for of late we've prospered well,
An' I've worked so hard, she figures I should have a breathin' spell.
But seemingly there's something allers doin' on a farm,
So I tell her, 'long in April: "Well, I guess I'll cut an' run
An' leave all care behind me when I get the plantin' done!"

The plan appears t' suit her, so I labor like a Turk,
Through May and June kept busy by the season's rush of work.
By that time wheat's t' harvest an' my early corn's in silk,
There's calves that need attention, and there's four fresh cows to milk.
An' then there's lots o' tinkerin' 'fore summer work begins;
The wheat-crop's extra heavy an' I'll have t' have more bins.
Somebody has to plan things an' it seems like I'm the one;
So I say: "I'll have that visit when I get the threshing done!"

July slips into August, and September runs its race,
An' still my time is occupied a-fixin' up the place,
A-mendin' fences, maybe, pickin' apples, makin' hay,
An' pretty soon October an' November's slipped away.
Then, 'fore one knows it, winter holds us in his frosty vise,
The stock needs more attention, an' I have to put up ice.
An' I haven't time t' take that promised visit now, 'tis plain,
For before I'd half get ready, 'twould be plaintin' time again!

—Roy Farrell Greene.

HARVEST MITES, OR "CHIGGERS"

Inflamed spots, due to the presence of mites, known as chiggers, under the first layer of skin, are often diagnosed as hives, nettle rash, urticaria or "weals," and resemble closely the "bites" of fleas and of some mosquitoes. A characteristic of the harvest mite attack is that on the second or third day the mite infested areas of the skin are usaully surrounded at the middle by a minute water blister. After the subsiding of the inflammation and itching, which takes place after a few days, a small scale or scab frequently forms, leaving on some persons a scar which does not wholly disappear in extreme cases for weeks.

These mites usually attack the most exposed portions of the body first. They crawl into the stockings and penetrate the skin about the ankles, frequently below the knee. A period of a few hours usually elapses, after the mites have crawled into the pores of the skin, before they become painful. Sometimes the person afflicted becomes almost frantic from the irritation, and lacerates the skin by too vigorous and frequent scratching. Only in rare instances, however, is the result of an attack of chiggers serious.

In some localities where the harvest mite is found in great numbers, to walk among blackberry or other shrubbery or come in contact with grasses or similar herbage along streams or pools on edges of marshes, or under trees near such place, is to invite an attack. It is obvious, therefore, that the best preventive is to avoid exposure.. However, if a bath is taken in hot water or water containing salt or strong soap within a short

time after exposure, no ill effects will be experienced. After a longer exposure a bath is practically of no effect.

Remedies Prescribed

Sulphur is the best remedy for mites and is also the best preventive of attack. Since the harvest mites usually become attached to the person in walking through vegetation, it has been found, according to the bulletin, that sifting flowers of sulphur into the underclothes from a little above the knee, downward and into the shoes and stockings, is effective. Napathalene has been successfully used in the same manner ,and is also considered a safeguard against several forms of manifesting tropical insect pests.

If a person has been exposed to an attack of harvest mites, an application to the affected parts of a moderately strong solution of ammonia is possibly the best counter-irritant. Bicarbonate of soda, or common cooking soda, or saleratus may be substituted in saturated solution. Similar alkaline solutions would probably also serve in counteracting the insect poison, which is acid. In case the suffreing is severe, dilute tincture of iodine or collodion should be lightly applied.

Eliminating the Mites

Where a large tract is to be freed of the pest, such as lawns, country grounds, pathways, roadsides, the method recommended by bulletin 2671 U. S. Department of Agriculture, is to keep the grass closely cut, the weeds eliminated and useless herbage mowed as closely as feasible, so as to expose the mites to the sun. In some cases it may be practical to spray the grass and other plants, after cutting, with flowers of sulphur or a dilute spray of kerosene emulsion, in which sulphur has been mixed.

Grasses bordering on ponds frequented by cattle, wild blackberry bushes and similar plants, should be cut down and destroyed in the vicinity of houses where people are liable to be infested with the mites by passing through them. Cattle, sheep and goats have often been used successfully in keeping down the grass and other vegetable growth which may harbor chiggers.

The harvest mites are not true insects, but belong to the class of spiders, ticks and the like. The mature mite wanders about, feeding on aphides, small caterpillars, and in the case of one species, on the eggs of grasshopper or locusts. One form of chigger hibernates in the soil, or other sheltered locations, and in the spring deposits her eggs, there being only one generation produced a year. The eggs are laid in the ground, sometimes as many as 400 in one place. When the larva, which is microscopic, blood red, and shaped somewhat like a common tick, hatches, it is circular or ovoid in outline, and each of its three pairs of legs is tipped with two or three prominent claws. After the larva has become attached to its insect host it grows rapidly and when full fed, seeks a convenient shelter to change its shape without molting. Within a few weeks it emerges a full grown chigger or mite of different shades of red and with eight legs, instead of six as found on the larva.

CO-OPERATIVE CREAMERIES

There are, perhaps, few dairy districts but what have at some time been interested in a co-operative creamery. Such interest usually comes from two sources. First interest developed by promoters who desire to profit by building and equipping the plant. Secondly, interest that is developed within the community by members of that community.

When the interest is developed by promoters failure is too often the result. Not all promoters are rascals, neither are all creameries organized by them failures. Nearly every state, however, can show several communities in which the dairy industry has been set back 10 years by the premature organization of a co-operative creamery by promoters. The promoter is very successful at creating interest in a creamery but such interest is soon lost when the promoter receives his last payment. To be successful, co-operation must come from the heart of the community. When the interest is injected from some outside source it is not likely to live when the source is removed, the source being the promoter.

When the interest in a creamery is developed within the community a social interest is also developed which is a very important factor influencing the success of the organization. There are more conditions affecting the success of co-operative organizations than in other forms of business organizations. Mere business principles do not entirely determine whether or not a co-operative organization is to succeed, when the interest is developed within the community a mutual feeling is developed which is hard to develop from any other source.

When sufficient interest is manifest it is usually safe for the community to take steps to organize a creamery. Care should be taken to determine exactly the number of cows that will furnish cream to the creamery—at the same time taking a census of the total number of cows within a radius of ten miles of the plant. If 600 cows are available the plant will be commercially possible. If less are available the organization should be postponed.

If the proper number of cows are available steps may then be taken to perfect the organization. It is well at this meeting to add enthusiasm and interest by having talks by representatives of the Agricultural College and successful co-operative creameries.

The history of most any industry will be found to be also the history of one or more individuals. It is therefore necessary that the manager be selected with care and deliberation. Preferably the manager should be a man of known business ability and a member of the community. A local man will know the traditions and all conditions of the community and be able to secure the very best results in financial ways. He will also understand the personality of the individuals in the community and can secure and hold their interest in a personal way that a stranger could not do. Whenever market conditions are poor it is sometimes feasible to secure as manager a man that has had experience in the markets.

The benefits of a successful co-operative creamery are many and lasting. If the co-operative spirit is prevalent the creamery organization acts as a nucleus for other co-operative efforts. Surely there is nothing that will advance the dairy interests so much as a co-operative creamery.

O. G. Simpson,
Oregon Agricultural College.

GOOD COWS

To obtain a herd of good cows, we must breed them. To do this, we start with our native or grade stock, just what we have on hand, for our foundation, then test out and cull out the poor and unprofitable ones, and use the balance for the foundation of our future herd.

With this foundation, we will mate a pure bred sire, but before we ever start to select this sire, we must make up our minds to the breed we will take the most interest in and the one that will fit our conditions bes, then we are ready to select the sire.

It is not enough that he be simply registered, but he must be of good conformation good size, strong and vigorous, and from producing ancestry. His dam should be a producer, and if several generations on both dam's and sire's side are producers, so much the better, for from such a sire as this we can reasonably expect something good.

You will say such a sire will cost too much, we cannot afford to buy him, but I think we can afford to buy a good sire if we look at the investment in the right way.

In our experience, we have found that our first purchase price of a sire has kept us in sires ever since, even better than that, we have sold proven sires for more than we paid for them and have not only been kept in sires, but still have money in this fund.

Another way of looking at this question is that when grade cows are selling from seventy-five to one hundred and seventy-five dollars, it won't take long for the difference in the selling price of common and grade stock, to say nothing of the difference in production, to pay for a good sire, for it is to the sire that the difference must be credited.

When a sire is found to be a getter of high producing daughters, by all means buy him in preference to a young or untried sire.

Very much depends on the selection of the sire, for after mating him with your herd, it takes nearly a year before the calf is born, then it takes two years more to develop the calf into a cow, then another year to test her to see what she is good for. If your selection has been a bad one, four years have been wasted, but if your selection has been a good one, you are well on your way to a successful herd.

The first cross of this sire will be fifty per cent of his blood, and should be both better producers and worth more on the market than their dams, and each succeeding cross should improve them for several generations, when they will be nearly as good as pure breds for production.

While we are building up our grade herd, we may just as well be building up a pure bred herd at the same time by purchasing one or two pure bred heifers. The same sire will do for these pure breds that we are using in our grade herd. These heifers, too, should be well bred, for we should have a good foundation for our pure bred herd. By starting in a small way, it will not require a large sum of money for our foundation stock, and by growing up with our herd we will gradually acquire a knowledge of feeding and caring for a herd of pure bred cattle and can more readily dispose of our surplus breeding stock at good prices without as expensive advertising as would be necessary with a large herd to start with.

Why should we breed pure breds? Because there is no line of live stock breeding that offers such profits, field for thought, study and scientific research as does the developing of the dairy cow.

Now here again comes the expense of purchasing these heifers. Can we afford it? A young man invested seventy-five dollars in a young cow. He kept all the heifer calves and at the end of nine years had about forty head of cattle. As he had bought no females other than one, all were related to this one cow, and he had refused twelve thousand dollars for the herd. Twelve thousand dollars for a seventy-five-dollar investment in nine years is no mean proposition.

A man may breed scrubs for forty years and be no further along at the end of that time than when he commenced. He may breed grade stock for a life-time and breed stock of great producing quality, and this stock will sell for good prices, and still he will be unable to sell the male stock for much more than meat prices, but with pure bred cattle there seems to be no limit to their production or sale prices.

A record is made that would seem the limit, but in a short time it is exceeded by some cow almost unheard of. The record of a few years ago that seemed almost unapproachable is today among the common ones, and all the pure bred males that are fit for sires can be sold for good prices. A man can well afford to invest in a few head of pure bred cattle for a foundation, if he is a person that understands the feeding, development and care of high-class stuff.

Care of the Calf.

The feeding of the calf takes a very important place in the development of good cows. , She should be born of good, vigorous parents, in a clean, dry stall. We leave the calf with its mother a day or two, then feed carefully, being careful not to overfeed. All the milk is weighed out to the calf, so we can feed an even quantity as the calf demands. As the calf gets to eating grain well, we gradually change to skim milk and feed about all the grain and good, bright hay and silage the calf will eat up clean.

We keep the calf growing and in good condition from the time it is born until it is a cow, which should be about two years old, or possibly a little later with the larger breeds. Then we should continue to feed her right along as she grows older to develop in her that which her Creator intended her to be.

Who can tell by looking at a wabbly, little calf a few hours old if it will develop into a cow worth fifty, five hundred or five thousand dollars? They all look alike, let us then take good care of the calf, develop it right, then if it does not bring the five hundred or more it will not be our fault.

There are three things that must be considered to build up a herd of good cows. First, breed, then feed, then care. No matter how well bred a cow may be, unless she is properly fed, fed according to her requirements and individuality, she will not do as she should. Then if she is well bred and well fed and not properly cared for, she is still a failure. She must be kept comfortable, quiet and contented. She needs good light, good air, plenty of water and kind treatment. Good cows are not developed by harsh treatment. —W. H. Clark, Address before Wisconsin Farmers' Institute.

"The Quality Goes IN Before the Name Goes ON"

Your Children's Musical Education

Musical education is more than ability to manipulate the keys of a piano. It is musical appreciation and ability to produce real music from the instrument. This means training the eye and the ear, as well as the fingers, and the finest toned piano should be used from the beginning.

Start your children's musical education with a piano selected for beauty of tone and responsiveness of action.

Crown Pianos

have such a pure, even tone that they are ideal for awakening the proper appreciation. The action responds to all variations of touch, so that fine control can be developed in the student.

The Crown, a fine musical instrument, may cost more than some other makes—but you are buying it for a lifetime of service, and it requires no greater *immediate* payment than you care to make. A few payments more or less is the only difference to your pocket, but the character of the instrument is of great importance in the education of your children.

Send for our booklets which explain piano value, also what to look for in the selection of an instrument for your home. These booklets contain real piano information, and guided by them you are sure to select a good piano. They are FREE for the asking. Mail the Coupon *TODAY.*

ADVANTAGE OF MAKING CORN INTO SILAGE

Silage, or "canned corn," is now conceded by experts to be the most important of all feeds for farm animals. The chief advantage of making corn into silage is that the entire corn plant is taken from the field at a time when it contains nearly the greatest amount of digestible nutrients. The making of silage preserves the corn in such a way the feeder has available in a very convenient form a paltable and succulent roughage, which more nearly corresponds to pasture grass than any other feed.

By making corn into silage the loss in feeding value of the corn is considerably less than in the best method of curing the corn in the field. The Pennsylvania agricultural experiment station has found that from 35 to 40 per cent of the digestible nutrients of the corn plant are in the stalks and leaves. It is not too much to say that in ordinary farm practice the greater part of these are wasted. By using a silo the farmer is able to add one-fourth to one-third to the feeding value of his corn, which by the way, is our cheapest forage plant.

When green corn is put in the silo, the succulence of the original crop is retained. The losses from fermentation and spoiled silage on top are small compared to the loss in field-cured corn from leaching and moulding. Because of the condition in which the corn is preserved, animals will eat it much more readily, and there will be practically no waste, as all of it will be eaten.

Comparative Results of Feeding Trials

It is of interest to know the comparative values of silage and corn fodder for the same area of land. The Vermont, New Jersey, Pennsylvania, and Wisconsin agricultural experiment stations have carried on practical experiments along this line. From an average of the trials—ten in all—which have been made, it has been found that the dry matter lost in curing fodder in shocks has been 20 per cent, as compared to a loss of 15.7 per cent in the silo. There is also an average loss of 16.2 per cent of protein in the fodder and 11.1 per cent in the silage.

Another advantage of the silo for storing feed for livestock is that it offers a means of keeping in a small space a large quantity of forage free from exposure to the weather and in a convenient form for feeding as well. The storage space is very small as compared with that required for hay fodder, corn, or other forms of roughage on the farm. In fact, more feed can be stored in a certain space as silage than in any other form.

It has been determined that in a silo of good width and depth, a cubic foot of silage will weigh about 40 pounds. In the average mow a cubic foot of hay will weigh five pounds. Since corn silage contains 26.4 per cent of dry matter and hay 86.8 per cent of dry matter, it follows that a cubic foot of silage will contain 10.45 pounds of dry matter, while a cubic foot of hay contains only 4.34 pounds of dry matter. From these figures it can be determined that silage will contain about two and one-half time sas much dry matter as the same volume of hay.

Comparative Feeding Values and Cost of Silage

The feeding value of silage compares favorably with other feeds. It is not an easy matter to make an estimate of its feeding value, since it must be based on the kind of stock to which it is fed, the kind of feeds with which it is to be used, and the value of feeds which it replaces. In an experiment conducted at the Kansas agricultural experiment station a few years ago, a value of $5.65 per ton was placed on the feeding value of silage for fattening cattle. At present its value is probably as high if not higher.

Prof. A. L. Haecker, formerly of the Nebraska college of agriculture, estimates the feeding value of corn silage as follows:

One ton of silage equals one ton of sugar beets.

Three tons of silage equal one ton of clover hay.

Three and one-half tons of silage equal one ton of alfalfa hay.

Two and one-fourth tons of silage equal one ton of marsh hay.

Three and one-half tons of silage equal one ton of prairie hay.

One-half ton of silage equlas one ton of pumpkins.

Prof. Haecker also gives the compartive cost of putting up silage and hay and the number of cubic feet occupied by each as follows:

Cost to put up one ton of silage, 63c.

Cost to put up one ton of hay, $1.50.

One ton of silage occupies 50 cubic feet.

One ton of hay occupies 500 cubic feet.

Referring to this statement he makes the following statement:

"It will be seen that ten times more space is required for hay than silage, and I do not believe it possible to construct even a cheaper hay shed, to say nothing of a barn, for the prices required to store the same quantity of silage. With the ordinary hay loft in a good dairy barn, the cost of storage space would be three times that of the silo. It can be seen that corn silage can be put up for almost one-third the cost of hay. While hay is about three times richer in food elements, it is still an expensive roughage as compared with silage.

"Until the feeder can find a food equal to corn silage for even twice the cost, he had better seriously consider the silo. Under present conditions, I believe that one-fourth of all the farmers keeping stock in the Corn Belt will find a silo an economical investment."

The problem of pasture is one of the biggest the dairymen and stockmen have to solve, and many of them are finding the solution in the silo. The summer silo supplements pasture and is coming into use very rapidly. It is a practice which the best agricultural authorities are advising farmers to adopt. It requires practically three acres to pasture a cow for a year, while an acre of silage yielding only eight tons will provide roughage for two animals for a year, and the land will maintain with the use of a silo practically six times as many cattle as it will under the pasturage system. The preceding statement is based on the results of experiments and observations at the Virginia agricultural experiment station.

Approximate Daily Ration of Silage

Kind of Stock	Wt. Lbs.	Fed per day Lbs.
Horses—		
Colts	500	5
Stock horses	1,200	12
Work horses	1,300	10
Cattle—		
Calves	500	12
Stock cattle	1,000	20
Beef cows	1,300	30
Dairy cows	1,000	40
Fattening cattle	1,200	25
Sheep—		
Stock sheep		3
Fattening sheep		3

—E. Lloyd Watson, in Threshermen's Review.

FARM WORK SHOP

The proper thing would be a building 14 x 16 feet, well lighted and with doors large enough to admit machinery to be repaired—though this is not so essential. Many times an old building may be utilized for this purpose or a part of the tool shed might be partitioned off as a work shop, provided it has a good roof and can be made comfortable on bad days. One can hardly estimate the value of such a place in which to work and much valuable time can be saved in fixing up the machinery, making gates, chicken hovers and in doing other odd jobs on days when the weather won't permit any out-door labor.

I like to have the shop handy to other buildings as it saves steps and then, too, it insures the return of the tools to their proper places when used outside the shop. One need not buy many tools at once but can buy them as needed or as the money becomes available for this purpose. Buy the best then take good care of them. To do good work one should have four hand saws, one fine, one coarse cross-cut, one rip and one key-hole saw. A set of wood chisels, although the half, three-quarters and inch sizes are the ones mostly used on the farm. A good brace with a set of bits are indispensable, also a set of drill bits. A good hammer and hand-axe are the most essential and other tools may be added from time to time as one becomes proficient in the use of them. A good grindstone and where one is without power a bicycle grinding machine and set of emery wheels are a good investment. I was lucky enough to win such an outfit with ten good ears of corn three years ago and it has proved handy many times a year.

The shop should have a good workbench and vise, one that opens six to eight inches will be found the best for the average worker and will stand hammering without being liable to break. Some times such things can be purchased second-hand at a very low figure and will be just as good as new. For light blacksmithing there are farm forges and anvils on the market suitable for light work and should be found in every shop. I have also found it a good practice when getting out posts and wood during the winter to pick out good straight grained timber and store away in the dry for use in repair work.

With the proper tools and material at hand one can repair a breakage in harness, machinery, etc., in half the time it takes to go to town; then, too, a considerable saving in cash can be made during the year.

A. W. Sarty, Moscow Mills, Mo.

Apple Blotch Causes Fruit Losses

Apple Blotch is a disease which occurs on the twigs, the foliage and the fruit. Infections may begin as early as three weeks after blooming and continue well into the summer. Usually, however, infections occur mostly from four to six weeks after blooming. It is necessary that the first spraying be on the trees by four weeks after the blooming. Bordeaux mixture is the only mixture used thus far that effects a satisfactory control, and in those orchards where blotch is known to be present to a seriously damaging extent it is the only mixture on which it is safe to rely. In cases of moderate infection a single spraying may be sufficient, but usually more than one is necessary.

A dependable schedule of treatment consisting of three applications is given by F. W. Faurot, of the University of Missouri.

First. Three to four weeks after blossoms fall, Bordeau mixture (6 lbs. blue stone, 8 lbs. lime, 100 gallons water) to which is added 4 lbs. arsenate of lead paste for codling moth. A stronger Bordeaux might be more efficient but the liability to injury would be correspondingly greater.

Second. Five to six weeks after blossoms fall Bordeau mixture, same as for first application.

Third. Nine to ten weeks after blossoms fall, Bordeaux mixture (8 lbs. blue stone, 8 lbs. lime, 100 gallons water) to which is added 4 or 5 lbs. arsenate of lead paste for the first spraying for second brood of codling moth. In south Missouri this application comes at just the right time to help control bitter rot.

The Missouri Farmer is offering a beautiful piano to some bright, ambitious farmer girl in every community in Missouri. By putting in your spare time for a few weeks you can easily earn one of these handsome instruments. Please write us for full particulars at once. Delay means that some other girl will get your territory.

Look Here--Read This!

I am anxious to raise $3000 by July 15th to take up obligations and to do so I will offer forty head of registered, Island-American bred Jerseys at very attractive prices; all bred at Sunset; all Sunset "Correct Type" Jerseys; any age and either sex, especially young bulls and bred heifers. Also, 150 head of Big Boned Spotted Polands, spring pigs, pairs or trios, not related, and gilts bred for fall farrow. Prices lower than I expect to make again this year at least. Satisfaction always guaranteed. Free circular. Now is the time to buy. Please mention your wants.

THE ENNIS FARM, Horine Station, Mo.
(Just south of St. Louis)

DONT FREEZE

another winter when you can enjoy **Comfort, Convenience, Health, and Fuel Economy** by installing a Steam or Hot Water Heating outfit.

Take Advantage of This GOOD BUYING Time—when raw materials and labor are cheap—and put in a heating system. Just as easy to install in old as in new buildings. Frees the house of dirt and dust and saves you money.

Let us tell you how to get better heat and more comfort for less money.

We install **Steam and Hot Water Heating Systems** in old or new farm houses, schools, churches, etc. also private water systems, bath tubs, toilets, lavatories, kitchen sinks, gas machines, and septic tanks for sewage disposal. Pipe and pumps at wholesale prices.

Estimate gladly furnished. Write for prices.

Eclipse
Gasoline Pumping Engines

Each engine complete with all accessories. Ready to run. Furnished with or without pump-jack attachment.

No. 1—ECLIPSE ENGINE

Will pump 570 gallons of water per hour against a 125 ft. head, using about 1 pint of gasoline per hour.

No. 2 Eclipse Engine without pump-jack

No. 2—ECLIPSE ENGINE

Will pump 900 gallons of water per hour against a 150 ft. head, using about 1 quart of gasoline per hour.

Strength, weight, durability, workmanship and fuel economy all guaranteed by Fairbanks-Morse quality.

Wherever there is a pump there should be an Eclipse Engine. The **price is so moderate** that every farmer can afford to have one. May we send you a catalog?

No. 1 Eclipse Engine and pump-jack attached to windmill pump.

Fairbanks Morse & Co.

ST. LOUIS KANSAS CITY

(1520-19D)

Standardized Engine Prices

To know what reputable, high-standard gasoline engines are worth, you have now only to remember the price as being less than $17.50 per horse-power. This is the new way of making prices uniform, adopted by Ed. H. Witte, the enterprising manufacturer of the fuel-saving WITTE engine. In the last two years Mr. Witte's lead in low prices, direct from the factory to the user, has brought engine prices to a lower level, and no doubt his latest announcement of uniform prices per horse-power for all his sizes of engines, from 2 H.-P. to 22 H.-P., will induce a general re-arrangement of engine prices to meet this new and sensible idea.

ED. H. WITTE

Besides this new idea in setting low prices, Mr. Witte has also adopted a new idea in engine rating—that of putting into his engines from 30% to 50% surplus H.-P. over the rating of the various sizes, instead of the usual 15% to 20% surplus, hitherto considered as standard practice by most engine manufacturers. Speaking of this, Mr. Witte said:

"My experience is that most folks, in buying their first engines, buy them too small, especially when buying the smaller sizes. The size ordered is figured, usually, for a certain work, but after the engine is in use there are always other jobs given to the engine, and when more work is found for the engine than its size is capable of doing the buyer regrets not having bought a larger size. At the same time, he does not wish to buy a second engine.

"To meet this situation I am now making my engines larger, while keeping the ratings the same as before; and, at the same time, have even lowered the prices. When pulling their full margin of overload, the fuel consumption is no more than that of other engines of the small rating, when pulling only their rated H.-P., The saving in price and in fuel, in addition to the extra power in each size WITTE, are the most important improvements in the field of general purpose, liquid fuel engines, and are meeting with hearty approval everywhere, among my old customers as well as the thousands of new ones we are making right along.

"I shall be glad to send full particulars of my improved engines, together with my latest prices, for cash or on reasonable terms, to all intending engine buyers; and will undertake to prove to every one that no gasoline or kerosene engine for general farm work should cost any more than my latest prices. Inquiries will reach me, addressed simply to Witte Engine Works, 1840 Oakland Ave., Kansas City, Mo., or to Office 184, Pittsburg, Pa., where we are opening a branch for the convenience of our many Eastern customers."—Adv.

FOR SALE—36 two-year-old thoroughbred R. I. Red hens and 1 one-year-old male, at $1 and $1.50. Mrs. Florence S. Tyler, Sweet Springs, Mo. 611

Holstein Bull Calves

A fine lot of very high grade Holstein bull calves out of grand daughters of the famous Missouri cow, Chief Josephine, and sired by a son of the premium state fair cow. These calves are in fine condition ready to ship now at $25 each. This is a rare opportunity to get a bull of the best breeding to improve your milk stock. Better order now as I have had to return money for orders I could not fill.

D. D. MOSS & SON, Columbia Mo.

YELLOW PINE BLOCK FLOORS

The domestic animals of today—cattle, horses, hogs and sheep—certainly have many advantages not enjoyed by their forbears. While the ultimate end of all such may be the same now as yesterday, the four-footed folk of the farm now might be said to be "living by the way" in luxurious comfort as they journey through life, as compared with the rough and rugged existence of live stock of earlier generations.

Farm animals are much "coddled" these days. That is because the farmer is only just getting acquainted with the stock on his farm. It is only in recent years that the dairyman, the stock feeder and the breeder have learned that care for the comfort, contentment and general health of their animals is as surely productive of profits as generous feeding is. The result is that the provision of better shelter and improved sanitary conditions have materially aided selected breeding in the development and increased efficiency of special purpose animals. The time has passed when farm stock, however bountifully fed, are expected to produce satisfactory profits if they are exposed to inclement weather, or housed in dark, draughty, uncomfortable and unsanitary quarters. Light, air, warmth and clean beds are regarded as just as essential as abundant feed and "quality" in individual animals of the farm producers.

Such care and attention is no where more productive of good results than in the quarters provided for dairy stock and brood sows. Both the quality and quantity of milk given by a cow improves with every reasonable addition to her comfort, and the expense of providing warm, clean farrowing houses for hogs is quickly repaid in more and better pigs and in the improved condition of the brood stock. One modern measure that promises to find general adoption among progressive farmers is the sanitary, comfortable floor in dairy barns and hog houses, relieving the animals from the necessity of standing and lying in wet, cold, unhealthful quarters. For this improvement nothing has been found to excel in effectiveness creosoted yellow pine blocks, which make a smooth warm sanitary and moisture proof floor that lasts practically forever. The wood blocks not only make an ideal floor for horse stalls and dairy barns, but they are particularly desirable in farrowing houses for hogs. The block floor not only is warmer than earth or concrete, but the preservative used in the wood—creosote—is a powerful disinfectant in insecticide and absolutely eradicates vermin.

Laying a creosoted yellow pine block floor is a comparatively simple process, easily accomplished by the farmer without the aid of skilled labor. The important points in making a first class job are care and thoroughness. If the barn, stable or farrowing house has a stiff clay base, no other foundation, except a sand cushion, is needed for the blocks, provided the clay is smooth and tamped evenly with a slight slope for drainage. If the floor base is soft, there should be a foundation for three inches of concrete. This concrete is composed of one part Portland cement, three parts clean sand and six parts gravel or broken rock, sized ¼ inch to 1½ inches. The sand and cement should be thoroughly blended dry, then sufficient water added to make a thin mortar after which the broken stone is turned in and well mixed. This should be spread evenly over the earth base, well tamped and smoothed over the surface.

When the concrete is well hardened—it should be let stand four to eight days—there is placed on it a half-inch of well screened sand and cement, three parts of the former to one of the latter. Immediately before the blocks are laid, sprinkle the sand and cement with a hand sprinkler and on it set the blocks so their surface shall be smooth and the joints close. Level the surface, if necessary, by light tamping. Brush sand over the floor that minute spaces between the blocks may be filled.

When an entire floor is to be paved with the yellow pine blocks, an expansion joint from a half inch to an inch should be provided for around the four walls by placing a strip of plank against each wall before the blocks are laid. When the blocks are set firmly and brought to an even bearing, remove the strips and fill the spaces with asphalt, cement or paving pitch filler, heated until it runs like water.

It is only recently that it has been possible to obtain creosoted yellow pine blocks and lumber from retail dealers generally, so the farmer has been one of the last to profit by the most effective wood preserving treatments. Creosoting posts and other timbers has been practiced to some extent by farmers, simply dipping the wood, but that method is not nearly so effective as the factory treatment in which the yellow pine is incased in an air-tight receptable, the air exhausted, and the creosote forced into the wood under heavy pressure. The creosoting greatly prolongs the life of the yellow pine which in its natural state is one of the most durable of woods.

A Bad Job of Plastering a Silo

A reader, Mr. W. Heavner from Polk County, writes that he had a Gurler silo 14x35 built last August. Three feet of the silo is concrete below the surface of the ground. The man who built the silo ignored instructions and placed the lath so close together that the plaster did not clinch good. The plastering is not over one-fourth inch thick and has cracked and some of it has fallen off. The silage spoiled all around the outside for about 18 inches at the top and 8 inches at the bottom. Tell me what I can do to make it air tight without taking it all off and doing it over.

Reply: The very best thing to do would be to take the lath off and put them on right and plaster it over, but if you do not feel like standing that expense if the plastering is not loose on the lath you might patch the places that have fallen off and then line the whole thing with tarred building paper. If this paper is put on and lapped well it ought to make the silo air tight and will last a year or two, until you feel able to replaster the silo.

Corn 60 Cents—Pork Costs 5 Cents

With corn valued at 60 cents a bushel the cost of feed alone for producing a pound of pork is five cents, according to Bulletin 147 of the Nebraska Agricultural Experiment Station, just issued. Among other things, the bulletin says that the most suitable supplementary feed to corn for fattening hogs seems to depend on several variable factors. Oil meal, cold pressed cottonseed cake, and tankage rank close together in the profits secured in nearly all tests. In some tests these by-products give faster gains and more profit than corn and alfalfa, and in other tests the reverse is true. The physical condition of the hogs as influenced by weather and other factors seems to determine whether alfalfa hay or such a by-product as those just mentioned is the most profitable to feed with corn for fattening hogs.

An Encouraging Approval

The Missouri Farmer:

I have thought at least twenty times I would write you to let you know how much your valuable paper is appreciated by us. The article on the front of your paper is alone worth many times more than the subscription price. Certainly you are in the work heart and soul. No farmer in Missouri can afford not to have your paper. It seems that you are always right, and have such a deep interest for the farmers. I can't see how any one can read The Missouri Farmer and not have a kindly feeling for Mr. Ellis. Long may you live and prosper and your paper ever advocate the good work. Sincerely yours,

W. F. Heavner, Humansville, Mo.

Thinking About a Silo?

If you are thinking about erecting a silo this summer you ought by all means to drop a postal card to the Dickey Mfg. Co. at Kansas City and ask them to send you the full particulars about their "Jug" silo, made out of vitrified clay tile. It is unquestionably one of the greatest silos ever placed upon the market and promises to have a great reign of popularity. The Butler Mfg. Co. at Kansas City are also putting out a fine new silo well worth investigating. Drop both of these concerns a postal card and ask for complete information. Thousands of new silos will go up this year and there is danger of the manufacturers not being able to supply the demand. Be sure to mention The Missouri Farmer when you write.

BEAT Out the GRAIN

Just as you would do by hand with a pitchfork. It is the only correct principle. In no other way can perfect separation be done. That method is used in the *Red River Special* and in no other thresher.

It SAVES the Farmer's Thresh Bill

The Big Cylinder, the Man Behind the Gun, the Beating Shakers, the Graduated Adjustable Chaffer are a combination insuring perfect separation and cleaning found only in the *Red River Special,* the most profitable machine for the thresherman and farmer.

It gets the best jobs, threshes more grain, runs more steadily and makes the thresherman more money than any other.

SPECIAL ATTENTION!

We would especially call attention of our readers to the change of The Ennis Farm ad in this issue, on page 12. This ad fully explains itself. Sufficient here to say that the Sunset "Correct Type" Jerseys has had a significant meaning for fifteen years and many a purchaser has gotten from this herd the type he was seeking, combined with heavy production, which is so hard to secure. The blood lines, mostly the combination of those of old Imported Blue Belle and Golden Rosebay crossed onto American bred St. Lamberts, Combinations and Tormentors, and then recrossed onto a combination of Golden Rosebay and Golden Ferns Lad blood, that Mr. Ennis has combined in breeding up this well-known herd, has resulted in wonderfully handsome animals with wonderful productive capacity. The Ennis Farm Big Boned Spotted Polands are second to none and Mr. Ennis is probably the largest breeder of this most popular Corn Belt hog. With lots of fresh separator milk from the Jersey hred, lots of good pasture and pure water, with a good feed of shorts and a top dressing of corn—who can beat this combination for the production of great pigs. Read this ad and if interested in either registered Jerseys or Spotted Polands get the Ennis Farm prices before buying elsewhere. In answering please mention this paper. Adv.

J. F. Richards & Son, Bevier, Mo., Sept. 1.
Halleck Bland, Centralia, Mo., Sept. 16.
N. R. Riggs, Lawson, Mo., Oct. 14.

Baker & Sons Good Polands

W. A. Baker & Son, Butler, Mo., are ready to ship choice spring boars and gilts of strictly big type breeding and they will be glad to hear from any of our readers who are interested. The Baker herd has long been recognized as one of the better herds of this state when judged from any angle. The spring stuff now in offer is sired by one or the other of the three herd boars, Big Look 63604, Big Bone's Son Jr. 71940 and Missouri Wonder 55408.

Big Look is by Big Gun, a son of Dorr's Expansion and is out of a King Look dam. He was shown with considerable success in 1913. That year he was second in the open class at Lincoln, was first and champion at Topeka, second at Hutchinson, second at St. Joseph, first at the American Royal. In 1914 he was third at the Missouri State Fair.

Big Bone's Son Jr. is by Big Bone's Son by Big Bone. His dam was Anna Price 11th by Pawnee Lad. This young boar was added to the herd last fall after he had won first at Lincoln, first and champion at Topeka, first and champion at Sedalia, second at St. Joseph, and third at Des Moines.

Missouri Wonder is a worthy son of the great old boar Blaine's Wonder. He has never been shown but has sired prize winners.

This herd is nominated in the Poland China Futurity Show to be held at the Missouri State Fair.

Messrs. Baker have a few good serviceable fall boars on hand that can be bought worth the money.

Shorthorn Bull Calf for Sale

R. L. Hill, Columbia, Mo., is offering for sale a shorthorn bull calf sired by Sir Henry Clay, the bull that the College of Agriculture has been using on the department's herd of milking shorthorns. Sir Henry Clay was bred by May & Otis, and is sired by the great bull Henry Clay, conceded to be one of the most prepotent sires of heavy milking shorthorns the breed has produced. The dam of this calf is a very high class cow from W. P. Harned's well known Idlewild herd. Mr. Hill is pricing this calf worth the money if taken soon.

Hall & Rapp's Spotted Polands

Attention is directed to the advertisement of Hall & Rapp, Rocheport, Mo., in which they offer a number of big strong fall boars that are ready for service. These boars are priced at $25 F. O. B. Rocheport and are exceptionally good bargains.

A Great Boar for Sale

Chas. L. Taylor, Olean, Mo., is offering a rare opportunity for our readers to secure a high-class proven Duroc boar. The boar in question is Professor's Col., by The Professor, a grand champion at Illinois State Fair.

Professor's Col. was farrowed April 3rd, 1912. He is rather of the compact type, is deep and thick with exceptionally well sprung ribs, good head and ear, well arched back and heavy hams, and stands on etxra good bone. He has proven a successful sire and many of the choicest gilts in Mr. Taylor's February sale were his get. He is being sold for no fault. Besides this boar, Mr. Taylor has for sale a number of good fall boars that have plenty of size and quality, and are bred in the purple. Any of our readers who need a boar will find it worth while to write Mr. Taylor for prices. Mention this paper.

Jersey Bulls and Heifers

Wm. H. Bruns & Son, Concordia, Mo., are advertising several young Jersey bulls old enough for service, and are offering them at prices that should interest our readers. They are sired by The Owl's Champion 85990, a grandson of Rubano's Fancy, a 21-pound cow.

The Bruns herd has long been recognized as a superior collection of Jerseys and we feel that our readers will be serving their own interests if they get in touch with this firm.

Gildow's Yorkshires

Frank Gildow, Jamesport, Mo., reports that he has only a few Yorkshires left and in view of the fact that he is closing out his entire herd he is prepared to make very attractive prices on what he has left. Several excellent sows and a few boars of the right sort are still on hand.

Most any farmer can afford to keep a Yorkshire sow or two just to furnish the family bacon. Write at once if interested.

Twenty Holstein Cows for Sale

M. E. Moore & Co., Cameron, Mo., who advertise Holsteins in this paper, are now offering for sale twenty head of females, all ages. This stuff is high class in every way and should go to buyers who are endeavoring to build up the standard of their herds. The Moore herd is the oldest herd of this state and one of the oldest herds in the middle west. For years it has been maintained on a high production basis and at present fully eighty per cent of the cows have A. R. O. records. This fact should mean a great deal to any prospective buyer because it is almost insurance that the progeny from such a herd will be profitable producers.

At the head of the herd stands the good bull, Sir Korndyke Imperial 53683, one of the best bred bulls of the breed, combining as he does the blood of Pontiac Korndyke and Hengerveld DeKol. Assisting Sir Korndyke Imperial is King Onusby Pearl, a very promising sire.

In addition to the twenty head mentioned, two aged cows are offered, and three mature cows that have lost a quarter. These five cows will be sold very cheap.

We recommend this offering very highly to our readers and trust that they will take advantage of the opportunity to secure really high class cows.

Missouri offers a wonderful future to the man who enters the pure bred Holstein business, but bear in mind that one should start with the good kind.

Kindly mention this paper when you write.

MISSOURI STATE DUROC-JERSEY BREEDERS' FUTURITY

Managed and guaranteed by the Missouri State Duroc-Jersey Swine Breeders' Association (Incorporated).

For the male and female progeny of registered sows nominated on or before May 10th, 1915, such progeny (not the sows) to be shown as pigs at the Missouri State Fair 1915. Entry fees will be as follows: $5 to nominate any owner's entire herd of brood sows, payable on or before May 10th, 1915; a second payment of $1 will fall due June 1st, 1915, on each litter from a nominated sow which it is desired to keep eligible in whole or in part; a third payment of $1 per litter will fall due on August 1st, 1915. These dollar payments are collective litter payments and when duly made shall qualify each and every pig in each and every such litter for exhibition in this futurity show.

The following cash Futurity prizes amounting to $405 will be paid:

Spring pigs	1	2	3	4	5	6	7	8
Boars	$40	$30	$20	$15	$10	$8	$7	$5
Sows	40	30	20	15	10	8	7	5
Litters of 4	40	30	20	15	10	8	7	5

Of the above amount $100 in cash is contributed by the Missouri State Fair and the same amount by the National Duroc-Jersey Record Association, Peoria, Ill.

Special Premiums.

In addition to the cash prizes the following special premiums are offered:

The American Duroc-Jersey Swine Breeders' Association, Chicago, Ill., offers a trophy for the first prize spring boar.

The National Live Stock Reporter, National Stock Yards, Ill., offers a trophy for the second prize spring boar.

The Missouri Farmer, Columbia, Mo., offers a trophy for the first prize spring sow.

The Duroc Bulletin, Chicago, Ill., offers an advertising card in the paper (one inch, for a year) for second prize spring sow.

The Farmer and Stockman, Kansas City, Mo., offers a trophy for the best litter of four, to be won twice by the same man before becomnig his permanent property.

The Swine World, Chicago, Ill., of-

CLYDESDALE HORSES FOR SALE

F. J. GREINER, BILLINGS, MO.

fers a trophy to the exhibitor winning the largest total number of points.

Conditions

A herd shall be understood to mean all sows owned by a nominator on March 1st, 1915. If any sow in any nominated herd be sold by the nominator the eligibility of the sow and her litter in utero goes with her through all subsequent changes of ownership. Transfers of nominated sows must be secured by purchaser by name and number and must be properly filed with the association with which registered prior to June 1st, 1915, when first litter payments fall due. At that time the dams of all eligible litters must be recorded, unless recorded at some prior date, and their names and numbers given with such litter payments.

At the time of making the third litter payment each individual pig of each individual litter must have been recorded with the proper association and their proper names and numbers must be forwarded with such third payment. Proper registration must be vouched for by the secretaries of the associations with which registration was effected. Others than those named on properly filed transfers of nominated sows will not be permitted to make payments on litters. If you buy a sow from a nominated herd, see that you get a transfer of her, otherwise you will not be allowed to make payments on her litter and show the pigs.

Only pigs farrowed during the months of March, April and May, 1915, will be eligible to compete. Those farrowed before, March 1 or later than May 31, shall not be eligible.

Pigs nominated in this futurity shall have the right to compete in all the regular classes at the Missouri State Fair to which they are eligible.

All payments are due in cash on or before the dates specified. Failure to make any payment when due forfeits all sums previously paid in and shall automatically declare any entry void and out of the stake. There shall be no refund after an entry has been accepted as in the stakes, but nominators incur no future liability by making any payment and all nominations may be dropped at will.

Substitutions will not be allowed, but nominations are transferable up to and including the date of making the final litter payment to the extent that once nominated and properly transferred from owner to owner, and payments duly kept up, any litter or any pig in any litter may be exhibited, irrespective of the number of times it may change hands.

Judges, as far as possible, will be those selected to act at the Missouri State Fair, but it will be stipulated that these futurity premiums must be awarded by a breeder of Duroc-Jersey swine.

It is understood that in order to be eligible to compete for prizes offered by the National Duroc-Jersey Record Association and the American Duroc-Jersey Swine Breeders' Association that animals must be recorded in each of these associations respectively.

Right is reserved by the management of the Missouri Duroc-Jersey Swine Breeders' Association to declare off this futurity by reason of insufficient nomination of herds, to alter, amend and interpret these conditions as it may see fit, and to make such other and further rules and regulations as may be necessary for the successful prosecution of this enterprise. In case of an insufficient entry being received and the stake being declared off in consequence, nominators will be so notified within ten days of the date of closing and nominating fees will be returned as received.

All nominations and litter payments should be sent to R. L. Hill, Columbia, Mo., who will also be glad to furnish information if such is desired.

Every pure-bred herd of Durocs in Missouri should be nominated in this Futurity. The advertising a herd and breeder will get by nominating and showing in the Futurity would be hard to estimate in dollars and cents. The agricultural and swine papers are going to give this Futurity wide publicity for it will be the first Duroc-Jersey Futurity ever held and it is managed and guaranteed by a State Breeders' Association.

The Missouri Duroc-Jersey Futurity is a certainty and will positively be held, and it is now up to the Missouri Duroc breeders to nominate their herds. The following herds have been nominated to date: A. C. Buckingham, Jamesport; R. L. Hill, Columbia; Longview Farm, Lee's Summit; J. A. Porterfield, Jamesport; Sheley & Clatterbuck, New Bloomfield; Chas. L. Taylor, Olean; W. H. & Geo. E. Thomson, Columbia; Dr. J. B. Unsell, Louisiana; A. White, Jr., Palmyra; W. I. Williams & Son, Belton; J. E. McPherson, Columbia. It is hoped that every other herd in the state will be nominated. This Futurity is open to every Missouri Duroc breeder and the more herds that are nominated the better for the breed, for the Missouri business, and for the breeders generally. This association solicits the nomination of every herd in the state.

For further information regarding the Futurity write R. L. Hill, secretary of The Missouri Duroc-Jersey Swine Breeders' Association, Columbia, Mo.

COW-TESTING A SUCCESS

According to a recent report of the United States Department of Agriculture there were one hundred and sixty-three co-operative cow-testing associations in operation last year in the United States. This is considered to be a rapid growth when it is remembered that the first association in this country was organized in Fremont, Mich., in 1905, and that as late as 1908 only 6 associations had been formed. The next year, however, the number rose to 25, and it has been increasing rapidly ever since. America is, nevertheless, in this respect still far behind Europe, where there are at the present time between 2,500 and 3,000 such associations, the first having been started in Denmark in 1895.

The principle on which these associations work is both extremely simple and yet important. Year after year many farmers milk cows that do not pay for the feed they consume. Indeed, the average annual production of a cow in this country is approximately 4,000 pounds of milk, containing 160 pounds of butter fat. The best dairymen say there is no profit in such production, and of course there are vast numbers of cows that fall far below these figures. To make his herd a success, therefore, the farmer must weed out the animals that are costing him money and keep those that are bringing it in to him.

This, however, is not so easy as it may seem. Experiments continually show that it is impossible for any man, however experienced he may be, to estimate with any accuracy the yearly production of milk from any cow. Some animals start with a very good production and then drop to a very ordinary flow, while others give a much more regular yield. The latter may at the end of the year have given the farmer much more milk, but he will probably consider the former to be the profitable ones. As a matter of fact, a man can not guess within a quart how much milk there is in a pail, and if he is selling the product of his herd on a butter-fat basis, he knows even less of the yield from each individual animal.

That a cow-testing association actually does pay has been proved beyond all doubt. Since the first organization of this kind was formed, in 1905, 76 for one reason or another have been discontinued. On the other hand the records of those in operation show excellent financial results. There are seven herds that have remained continuously in the Michigan association ever since it was formed, in 1905. In 1906 they included 50 cows and in 1913, 69 cows. In 1906 the average yield for each cow was 5,885 pounds of milk and 231.1 pounds of butter fat; in 1913 it was 6,123.4 of milk and 284.7 pounds of fat. In the meantime prices of both feed and dairy products had risen. The profit, however, to the dairymen in the association rose as well. For each cow it was, in 1906, $22.23 and in 1913 it was $51.08, or an increase of $28.85. It certainly paid these dairymen, therefore, to employ a tester even if it cost them $1.50 a year for each cow.

Not only do these records show which cows make or lose money for their owners, but they show to what extent each is profitable, the amount of feed given to each cow, and what kinds of feed at prevailing prices produce the most satisfactory financial results.

CALVES NEED CARE IN FIRST SUMMER

The first year of a calf's life is the most important with respect to its growth. Unless animals are kept growing during this period their final development will be much retarded, and the chances are they never will reach the scale which their inheritance would give them, says R. M. Washburn, University Farm, St. Paul.

On the best regulated dairy farms calves are born in the autumn and early winter, and they should receive skim milk in moderate quantities through much, or all, of the summer following birth. On farms having hand separators there is no difficulty in providing the sweet milk for calves, morning and evening; but farmers who patronize whole-milk creameries or who still skim by hand should remember that after the first few weeks milk for calves should either be thoroughly sweet or fully sour, that the most dangerous condition is the half-sour stage. If milk is fed to calves when it is in this changing condition it is almost certain to cause indigestion. It should not be half sour, nor sour one day and sweet the next, but always one or the other.

Clean feeding pails must be used, otherwise the germs of fermentation and diarrhoea will be brought to the infant cow from the slime of the dirty drinking dish, and with young calves it is important that the temperature at which the milk is fed be nearly that of the body. Older animals may receive milk of the temperature of the milk-holding tank.

While it is very important that heifers should have free access to pasture during the second summer, to develop strong bodies, the calf need not have pasture the first summer. In fact, for calves born after the first of the year, pasturing may be a disadvantage. Most young calves in this country are better off chewing tender hay in the quiet and half-dark stable than fighting flies, panting from the heat, and cropping tough grass in the pasture.

IDLEWILD SHORTHORN CATTLE

Milk and Beef Type. Dual purpose in name and in fact. Herd 50 years old. In one family, on one farm. The type is fixed. I have a strain that I believe rivals the famous Duchesses. Fine beef cattle that are heavy milkers. And deep milkers of fine beef type. Call, or this blood is safe by order.

W. P. Harned, Vermont, Mo.

Shorthorn Bulls and Heifers

PEABODY FARM now offers 12 choice young bulls and 20 heifers. Good individuals; reds and roans. Priced to sell. Also 20 open BERKSHIRE gilts. Get our prices.

June K. King & Son Marshall, Mo.

ChoiceAberdeen-Angus

Established 30 years. 100 head in herd. We are offering good useful Bulls, and Heifers of excellent individual merit and breeding. Prices reasonable. Our customers make them popular.

D. L. Sutherland & Sons Windsor, Mo

GALLOWAY CATTLE

Young stock for sale at all times. Herd established 25 years.

J. & W. R. CLELLAND, New Hampton, Mo.

Aberdeen-Angus

I am offering a number of young bulls, cows and heifers—good individuals and well bred. Also some extra good Poland China Hogs at moderate prices.

J. D. Blackwell Fayette, Mo.

ANGUS CATTLE

HERD FOUNDED 1904

Seven early calves—3 BULLS and 4 HEIFERS, sired by Dean's Eric 139686. Every one the right kind, and priced to sell.

V. E. LAWRENCE, SALISBURY, MO.

Angus Bargains

Registered bulls and heifers. The market topping kind. Leading families represented. Priced worth the money and satisfaction guaranteed.

Also Poland China hogs.

J. M. JONES, R. F. D. 3, EVERTON, MO.

MOLASSES Best Feed for Pigs and Calves

St. Louis Molasses Co., Dept. MF., 400 S. Broadway, St. Louis.

SWEET CLOVER SEED of high quality, specially treated for full and quick germination. Prices and information on request. Bokhara Seed Co., Box F, Falmouth, Ky.

Standard Veterinary Remedies

STANDARD BLOOD TONIC: To use it will mean money to you by increasing the value of your horses

It is a tonic and reconstructive for all run-down conditions, especially following Distemper, Influenza and Lung Fever. It causes the hair to shed more rapidly and new hair to grow with a beautiful luster. It aids digestion and restores vigor. Skin Affections, Chronic Diarrhœa and Chronic Cough. $1.00 with the order.

STANDARD EYE REMEDY: In Moon Blindness it shortens the attack and lengthens the interval; Pink-Eye in Horses and Cattle; efficient in Sore Eyes from any cause in Horses, Cattle and Dogs. One bottle will convince you. $1.00 with the order.

STANDARD BLEMISH REMOVER: Bone Spavin Splints, Ringbone, Sidebones, Jacks or Bony Growths, Bog Spavin, Shoeboils, Capped Hocks, Curb, Thoroughpin, Sprained Leaders, Bucked Shins, Windgalls, Sprung Hock, and Sweeney. These remedies are guaranteed to be efficient. $2.00 with the order.

STANDARD VETERINARY REMEDY CO.
BOX 942, INDIANAPOLIS, INDIANA, U. S. A.

THOMAS E. DEEM

AUCTIONEER

Selling pedigreed live stock is my specialty. Eight years of success in this line has proven that my customers are pleased.

Dependable service at a reasonable charge. Address, Cameron, Mo.

Harry W. Graham

AUCTIONEER

PURE BRED LIVE STOCK

Seventeen years experience with America's best breeders.

Chillicothe, Missouri

W. D. ROSS

Auctioneer

Pure bred live stock. Sales made anywhere on reasonable terms. Write for dates.

Otterville Missouri

DUROC JERSEY FALL BOARS & GILTS

We still have a number of choice fall boars and gilts sired by Beauty's Model, first prize Senior Yearling at the Missouri State Fair. Priced to sell, as we need the room.

W. O. & B. A. SMITH, Thompson, Mo.

Glenvarloch Large Yorkshires

The prolific, growthy and gentle bacon hog. Closing out entire herd at private sale. Bred sow, boars and pigs either sex. The produce of one Yorkshire sow will keep your family in delicious meat all next winter. Everything at bargain prices. All immune.

Frank Gildow, Mgr., Jamesport, Mo.

JERSEY CATTLE

Bulls ready for service. They are sired by the Owls Champion 85990. His grand dam on dam's side, Rubano's Fancy, has a record of 21 lb. 10 oz. in 7 days. We have these young bulls for sale at a price that ought to move them. Also a few heifers.

Wm. H. Bruns & Son, Concordia, Mo.

SPOTTED BOARS-JERSEY BULLS

We have a dozen Jersey bulls ready for light service and a dozen Big Boned Spotted Poland-China boars of November farrow that we will price very low for quick sale. Also bred heifers and spring pigs to offer.

The ENNIS FARM, Horine Station, Mo. (Just south of St. Louis)

Jersey Cows

I want to sell 20 head of registered cows and heifers that are either fresh or soon will be. Also four young bulls.

J. B. SMITH Platte City, Mo.

Registered Devon Cattle

Choice bull calves for sale from good milk cows. Bred at Northview Farm.

J. A. CASE Concordia, Mo.

HOLSTEINS

Young bulls and heifers from A. R. O. cows. Sired by Sir Korndyke Imperial 53683. Eighty per cent of herd have A. R. O. records. Inspection invited.

M. E. Moore & Co., Cameron, Mo.

Have You a Piano in Your Home?

No Modern Farm Home Is Complete Without a Piano--the Sweetest and Greatest of all Musical Instruments

In these days, no young woman's education is complete without her having the ability, to a modest degree at least, of performing upon this greatest of all musical instruments. In fact, her future social position depends very largely upon this fact. It gives her a grace and refinement that nothing else can. It gives her a "polish" which makes her more charming and delightful to herself and to her friends and loved ones—a solace and a pleasure which will add greatly to the joy she gets out of life.

But more than that: A beautiful Piano is an ornament which adorns the modern farm home as nothing else can and which is a delight that charms the whole family. Dreary indeed and desolate is the home which is without music which soothes tired souls and makes them forget for a little while the World's harsh battle—which, with its soft cadence and sweet harmony reminds us that there is something besides dollars to fight for and live for.

For over 45 years I have conducted music stores in the leading county seat towns of central Missouri and during this time I have sold thousands of Pianos to farmer families—**and I have yet to hear the first complaint about the quality of a single instrument I ever sold!** Buying and selling in large quantities, I can make you a better price than many small dealers and if you are in the market for a Piano I want you to write to me at once and let me show you what kind of value I can give you for your money.

And remember this at the outset—that I am financially responsible and that **my unqualified guarantee goes back of every Piano I sell!** If it isn't exctly as I represent it to be **you don't have to keep it!** I cheerfully refer you to the Publisher of this paper—or I shall be glad to have you write to any bank in Columbia, Macon, Moberly or Huntsville as to my standing and reputation as a dealer. All these banking institutions have known me for many years and can tell you whether my guarantee is good or not.

If you are not in position to pay the whole amount in cash, don't let that keep you from writing. All I want to know is that you are trustworthy when I will be glad to arrange the payments to suit your convenience. I realize that there are thousands of farmers in Missouri who do not live close to a large music dealer—and to such families I am sure **we can save a lot of money!**

The place you live in will seem more **like a real home** with a beautiful Piano—and the pleasure which your wife and daughters and you and the rest of the family will get out of it will make it an expenditure you will never regret. Write me **at once** if you are interested.

JOHN N. TAYLOR, MUSIC HOUSE - - - Columbia, Missouri

Branches at Moberly, Macon and Huntsville

BUCKSHOT BY THE PROFESSOR

My old gray mule may not be very fancy—but anyway I don't have to "crank him up" every time I start to go anywhere.

The more I watch the farm game the more I am convinced that the proper mixture of brains and fertilizer are the things that win.

If I was a millionaire (sounds fine doesn't it?) there is one thing I would do. I would spend the summer in Arkansas rather than go to Europe.

Old man J. Pluvius and Col. Chinch Bug have been having a "powerful bad misunderstandin" during the last week or two. The last we heard of Col. Chinch Bug he was headed "down South."

Old Jupiter Pluvius must have had some busted water pipes during the last ten days. It's mighty fine work, old fellow, but don't forget to save a little to prime the pump along in July and August.

The farmer who hitches his ambition to a good farm home, a big red barn and a piece of land without a mortgage nearly always gets there after awhile —and there are not enough unfavorable seasons in the calendar or bugs in the Universe to stop him.

Well, them "Eyetalians" finally threw their hat into the ring and here's betting they get their feet wet before they get it out. Anyhow, I feel relieved that they finally did one thing or the other. It's enough to have Hessian flies and chinch bugs on your nerves without piling a bunch of organ grinders on top of it.

Old "Josh" Simpson has a grouch on this week. He's "sore" because his wife spent $1.75 for a new summer hat. He says that "wimmin are gettin' too high-falutin"—that a sun bonnet is "plenty good enough"—that $1.75 would have kept him in "chawin' terbacker fer a whole munth."

Say, there's some mighty good alfalfa "dope" on the third and fourth pages of this issue—and the more of it you get into your system the better. There isn't any law in this state against growing alfalfa—and if every farmer had a five or ten-acre patch it would stop millions of dollars going out of Missouri for feed.

Old John Barleycorn is certainly having a tough time. Just as he was getting ready to sit up on the rail fence and watch the boys fight it out over in Europe, the whole outfit turned on him—and what they are doing to him and saying about him is a caution. About the only staunch friend he's got left is old man Huerta who used to be President down in old Mexico.

I see where "Teddy" got the best of a fellow by the name of Barnes up at Albany, New York, the other day. As I get it, "Teddy" threw his "hat into the ring," bared his teeth, gritted them, looked mad and mean as a bull dog that hadn't been fed for a week, yelled "Whoopee!"—and then began to talk —and after he had talked for four days hand running, everybody who wasn't under the table had taken to the tall timber.

Met a farmer in an implement store the other day. He was looking over some new self-binders. "Got a fine wheat crop comin' on and reckon I'll have to buy one of them things. Had a good one but it's been standin' out in the weather for the last three years and it's pretty badly used up." He's one of the kind that the new Land Bank Law won't help very much. He doubtless needs a new binder—but he needs a guardian a whole lot worse.

Two years ago The Missouri Farmer was the first publication of any consequence in Missouri to inaugurate a fight against the Single Tax fallacy. Since that time it has been ceaselessly pounding away for an Agricultural Credit System for Missouri farmers—and it contributed no small degree in bringing about a condition of public sentiment which led to the passage of the Gardner Land Bank Law in the recent Legislature. In other words, it is a home paper that really stands for the best interests of Missouri farmers —and I wonder, my good friends, whether you appreciate this fact? Or, are you among those who write the Publisher a "sour" letter when he asks you in a kindly way to renew your subscription and tell him that you are "taking a lot of other papers?"—papers owned by men who don't live in Missouri and who don't care a continental about the interests of the farmers of this state. I know there are not many of this kind of farmers in Missouri—but now and then you find one.

PHOSPHORIC ACID AND PLANT GROWTH

All plant food elements in the soil are important because they are essential, but we suppose those most abundant are most important. The three elements given first consideration usually are nitrogen, potash and phosphoric acid. The nitrogen we should aim to supply and maintain by carefully saving all the manure produced on the farm and then by growing more nitrogen gathering crops such as the clovers, cowpeas, soybeans and alfalfa. We can maintain and even increase the nitrogen content in the soil by growing these crops without any cash outlay, but for the other two elements, phosphoric acid and potash, in addition to the barnyard manure we will need to buy in some form these elements to supplement the manure.

Barnyard manure if applied too abundantly will cause a rank growth of straw and that is because it is not well balanced. A much better return can be had from the manure if it is spread evenly and more thinly over the field and there is used with it from thirty to fifty pounds of acid phosphate to each ton of manure. Where about six tons of manure are put on an acre, which is considered a light application, there should be 200 to 300 pounds of acid phosphate put on with it.

At the Ohio Station where 40 pounds of acid phosphate was applied for each ton of manure for every dollar expended for the acid phosphate there was a return of $5.48 in the increased value of the crops. A profit of $4.48 for a dollar invested in fertilizer is worthy of consideration. Either acid phosphate or rock phosphate will give good results but the acid phosphate will show the quickest returns and as most farmers need their profits at once it is perhaps better to use the acid phosphate.

A good way to mix the acid phosphate with the manure is to spread over the manure produced by each horse or cow about one pound a day and keep the manure under cover where it will not be leached out by rain. No other method has been found for spreading manure that equals the manure spreader. Where the manure is spread on the land every week there is little loss from burning or leaching and the most profit is obtained from it. Where the manure is allowed to remain in the barn lot and take the rains it does not take long to wash out one-fourth its value. Wasted manure is lost money.

Making Good

In the last front page story I referred to the "forks of the road" and the old guide post at the foot of which every boy is permitted to linger for a little while as he approaches manhood—and the fact that sooner or later he must choose between the two paths that lead out in opposite directions. I referred to the stern "Path of Duty" and the fact that years ago some of the great men of our Country had traveled over its rough and hard way. I said I would refer to the subject again and I am doing so because I don't want you to get the wrong impression. First I wanted you to realize that the man who accomplishes anything worth while in the World must be willing to toil and suffer—that there is no royal or flower-strewn path to success. It has ever been thus and thus it will ever be.

But I don't want any boy to misunderstand. Next to having no ambition at all it is almost as bad to have ambitions which are unreasonable or impossible. What this great Country of ours needs most in this momentous hour is more men who can make good in the humble, every-day walks of life rather than lawyers, orators or poets. Of these we shall always have an over supply as we have indeed at this very moment. We are living in a more enlightened age than the World has ever known before. Men no longer listen with open mouths to the dramatic exhorter as they did years ago—because today they know as much about public questions and policies as the exhorter and frequently more. And thus it has come to pass that we have more lawyers than clients, more doctors than patients and more authors than people who care to read the drivel they write—but out in the Nation's myriad fields, the chemist's shop and in the factory—there is where real opportunity beckons and in this arena will the future destiny of our great Republic be determined.

What is the real cause back of the great European tragedy? Are tens of thousands of men dying in the trenches merely that the name of another Napoleon or Frederick the Great may be written across the pages of history—or is it to avenge some imaginary ancient grudge? Not a bit of it—but back of the red-stained battlefields are desires for a more assured "place in the sun"—a herculean conflict which is driven on in its fury by the zeal of future commercial and industrial advantage. That, in the final analysis, the game is not worth the candle—that the whole terrible drama is unholy and a sarcasm upon the enlightened age in which we live—all these things may be true enough but for the time being they do not change the stern facts—and it is for us here in this great and blessed free Country of ours to demonstrate during the next twenty-five years that these ambitions, worthy within themselves, may be more triumphant in peace than in war.

Therefore, I say to you that what the Nation needs as never before at this time is a more universally capable citizenship—men who are enlightened and who stand for the best there is in manhood, who love their families and their Country—who make good in their chosen tasks however humble they may be—and among these tasks none is so important as that of the farmer who feeds and clothes humanity. I would rather own a good farm home and conspire with nature to bring golden harvests and fine flocks into being than arbitrate the petty quarrels of men in a musty-swelling court room for I would know that greater happiness and peace was in store for me and mine—and as for glory, what finer fame can man aspire to than the conscious knowledge that he is more necessary to his Country and to society than any other man who walks beneath the sun?

Fate has decreed that most of us shall be humble workers in the vineyard. Immortality comes to but few at best—and then only as they pursue some great task with a zeal which forgets everything but the thing in hand. Suppose that some farmer boy were to discover some new secret of the soil which would revolutionize American farming? Can you imagine any statesman being received with the plaudits which would greet this chemist of the fields? The true victories of the future will be won upon the farm, in the laboratory and at the forge—and of the three I would choose the farm every time.

—By the Author of After-Thoughts.

MAINTAINING LIVE STOCK STANDARDS IN EUROPE

Most of our well known breeds of live stock are of European ancestry. In fact, our breeds of American origin have been created from animals with European blood lines more or less remote. Therefore, it may be taken for granted that Europe must have been the possessor of many breeds of merit.

Familiarity with live stock conditions on the other side of the big pond will teach the American stockman lessons that will profit him greatly if he sees fit to apply them.

The visitor abroad is impressed with the fact that the people recognize the adaptability of certain breeds to local conditions and are largely governed in their breeding operations by this information. Some breeds, it is true, are more universally adaptable than others, but even then, the breeds in Europe are very generally restricted to special local environments. Perhaps this might be well illustrated by stating that in Scotland, excepting in the case of Shorthorn cattle, nearly, if not quite all, the breeds are of Scotch ancestry. At the Highland and Agricultural Society Show, the most prominent one in that country, the breed shown is emphatically Scotch. Excepting the Shorthorn, the English breeds are essentially unseen at this show.

The crossing of breeds in Europe is practiced but by well known combinations of blood lines and for definite purposes. This more particularly applies to beef, cattle and sheep. The breeds of horses in their native homes are maintained pure, while dairy breeds are rarely crossed. It is only for the butchers' use that the stockman practices crossing. The people do not have grade stock in the sense generally understood in America. Years ago I spent a most interesting day with Mr. George Adams, who owned 500 Shorthorn cows , which were used for furnishing milk for the London market. In reply to the question, "Are your Shorthorns purebred?" Mr. Adams said: "They actually are pure-bred. For a great many years I have bought no females and have used pure-bred registered males, so that my cattle are just as pure-bred Shorthorns as those of registered herds." That was, in fact, true, but here in America we would call this a grade herd.

The European breeder has a high standard of excellence. As a rule, he has the instinctive sense of a judge of animals, and he culls out his herd, so that under usual conditions much uniformity prevails among the animals. One does not find the wide extremes so common in the American herd or flock. All American visitors are impressed with this superior excellence of foreign herds.

If the breeder emphasizes the need of uniformity and merit in the females, he is sure to put a distinct premium on the males to head the herd. Foreign governments have been so impressed with the value of the high-class sire that they have not only offered great attractions to breeders to produce males of real merit, but they have also put restrictions on their sale, so that they might be retained, at least for a time, to the benefit of the herds of the country. This policy, in the hands of either the government or of the breeding association, has done much for some of the breeds, and particularly in Belgium, France and the Channel Islands. In fact, at the present time the British government is spending a consideable sum of money annually in promoting the use of superior sires. The French government for much over a century has expended a great sum of money each year for stallions and for their distribution over France. Prior to the present war, France had in her government studs and depots in different parts of the republic in public service something like 3,000 stallions. Each year the government has bought, at high prices often times, many of the best prize winners at the shows, to be dedicated to the public studs. No wonder the people of France have the best horses in the world when we take everything into consideration.

The European stockman as a rule selects his sire with a view to his special needs. He is a discriminating buyer, and does not hesitate to pay a high price as values go in his community. He recognizes that in general worthy animals are not cheap. Yet in Europe speculative, sensational prices are very rarely heard of. A friend of mine living among the hills in the border country of Scotland purchased at a sale in his neighborhood a Cheviot ram for about $600. He was a large breeder of these sheep and wanted this ram. Yet we have but few breeders in America who would pay over $50 for a Cheviot ram, and at no time in our history, in all probability has a breeder paid more than $100. Yet these figures are common in Scotland.

Perhaps the most important characteristic of many European breeders is to give a valuation to the chief sire in the herd that is not measured by money considerations. The breeder regards the sire as fundamental to the upbuilding of his herd and to the maintaining of his reputation as a breeder. And so he persistely refuses to price his animal. Americans have repeatedly attempted to buy breeding animals in Great Britain where no offer would tempt the owner. A friend of mine of very large means, who could well afford to pay almost any price, took a great fancy to a heifer at a Scotch show, and tried to buy. He made various large and tempting offers to the owner, but after each offer the reply was, "No! No! I dinna care to spare her." This is not an isolated case. It has been repeated many times in Britain.

In a consideration of a few of the factors that have been instrumental in the development of live stock abroad one should not overlook the importance of the instinctive love the foreigner and more especially the Britisher has for his farm animals. His life is one of unselfish devotion to his dumb beasts. The caretaker of the herd of every degree finds a pleasure in association with the animals in his care that is expressed in many thoughtful and kindly acts. No more tender, devoted and sympathetic lovers of the dumb beast are to be found than are to be seen guarding the herds and flocks of England and Scotland. No duty is so disagreeable as to deter one of these herdsmen from the thoughtful care of his charge. This explains very largely why those American agricultural colleges maintaining the most valuable and best herds of live stock place them in the direct charge of men of British blood or near ancestry. If one will but look about on the show grounds here in America, among the best herds and flocks, they will be surprised at the large number of English and Scotch lads in charge of the stock. Could there be a greater tribute to their worth?

Charles S. Plumb,
In Purdue Agriculturist.

[Professor Plumb is one of the best known live stock men in the country. He was formerly connected with Purdue, Indiana, University, but for the past several years has been head of the Department of Animal Husbandry, Ohio University.—Editor.]

WHICH IS THE MOST USEFUL WOOD?

There are about seventy-five woods that grow in the United States in quantities sufficient to give them importance in building and manufacture, and that are made into lumber for that purpose. In the event that some of these varieties should become extinct—the available supply should be entirely consumed—sometime in the remote future, which of the seventy-five, do you think, humanity could least conveniently do without? Which is the most useful wood we have—which serves the greatest number of persons for the widest variety of uses?

Few persons could answer that question in an off-hand guess. Many would say oak, because it is proverbially strong and dependable, and serves a great number of needs in building and manufacture, as well as having an established reputation for excellence as fuel. Some might mention hickory, or walnut, or ash, or fir, or redwood, or elm, or birch, or cypress—all have many uses and all are consumed in enormous quantities. But none of those is the wood in question.

The most useful wood that grows in America is Southern Yellow Pine, "the wood of a thousand uses." Not only is Southern Pine adapted to a greater variety of uses in building and manufacture than almost any other wood, but its by products, aside from the most important purpose of making lumber, are remarkably varied in their nature and application. So intimately is yellow pine and its products associated with the daily life of humanity that very few persons have any idea of the many ways in which it serves us. In city or country, day and night, whatever, our occupation or condition in life, Southern Yellow Pine is contributing something to our well-being, literally "from the cradle to the grave." Ordinary household and commercial uses of yellow pine we are familiar with—its use in furniture, house building, farm construction, implement manufacture and repair, bridge building, street paving, cars and other vehicles in which we ride. Many of us know that it is among the most important of woods used in shipbuilding, for ties and tresles in railroad building, and that it is extensively employed in the making of equipment of our play—outing goods and musical instruments. It even supplies wooden limbs to replace those we may lose in the vicissitudes of this life, and wooden caskets in which to bury us when we depart finally. But in addition to these more or less well known uses it has many others which you probably never would suspect. For instance the paper on which this is printed may be made of southern yellow pine—much of it goes for that purpose. The carpet your feet rest on may be southern yellow pine—southern pine needles undergo a process that transforms them into a fabric extensively used in coarse weaving and in upholstery. If you scent a disinfectant in the air it probably is one of several extracts from southern pine. If you catch a cold, rub your chest with turpentine (a yellow pine product) and lard, and swallow a little pine tar syrup (another yellow pine product).

Among the by-products of the Southern Yellow Pine forests are: pine tar, pine oil, pitch, charcoal, turpentine, resin, excelsior, paper, pine wool (used in weaving fabrics), pyroligneous acid, terpinol and an extract or distillate of the wood used in the manufacture of synthetic camphor. Pine oil is much used in the manufacture of varnishes and eventually may supplant linseed oil for use in paint.

So varied are the uses of Southern Yellow Pine that 36 per cent of all the commercial lumber consumed in the United States is that wood. More than 2,000 sawmills operate every working day in the year, sawing up logs to supply this demand for southern pine. And great shiploads of it are constantly going across the ocean, even in this time of war in Europe, to supply the demand for it in other countries.

Henry Schott.

Earn a Fine Piano

The Missouri Farmer is offering a beautiful Piano as a subscription prize to some ambitious farmer girl in every community in Missouri. Write at once how old you are, how far you live from your postoffice and in what direction. Also whether, if we give you the first chance in your neighborhood you will make a real hard fight to win this beautiful prize. We will consider it a great favor if housewives will bring this matter to the attention of some bright girl in their neighborhoods.

The Price of Progress

THE Panama Canal stands as one of the most marvelous achievements of the age. Into its construction went not only the highest engineering skill, but the best business brains of the nation, backed by hundreds of millions of dollars.

Suppose conditions not to be foreseen made it necessary to replace the present canal with a new and larger waterway of the sea-level type, to be built in the next ten years.

Also suppose that this new canal would be the means of a great saving in time and money to the canal-using public, because of the rapid progress in canal engineering.

This sounds improbable; yet it illustrates exactly what has happened in the development of the telephone, and what certainly will happen again.

Increasing demands upon the telephone system, calling for more extended and better service, forced removal of every part of the plant not equal to these demands. Switchboards, cables, wires and the telephone instrument itself were changed time and again, as fast as the advancing art of the telephone could improve them.

It was practical to do all this because it greatly increased the capacity of the plant, reduced service rates and added subscribers by the hundred thousand.

In ten years, the telephone plant of the Bell System has been rebuilt and renewed, piece by piece, at an expense exceeding the cost of the Canal.

Thus the Bell System is kept at the highest point of efficiency, always apace with the telephone requirements of the public. And the usefulness of the telephone has been extended to all the people.

The Farm Tractor Will Find a Place on the Farm

By Geo. B. Ellis, Managing Editor

The farm tractor is finding a more general use on the farms of this country every year. It would not find favor among farmers unless it filled a want. A few years ago when the automobile made its appearance there was a lot of prejudice against the "gasoline wagons" because it was thought by some that the automobile would eliminate the horse. Certainly some horses have been displaced by automobiles but there are a greater number of horses in the country today than when the automobile was first invented, and the horses are better in quality and worth more in price. When I was a boy it required two strong men to cut and bind two acres of wheat in a day. Today a fifteen-year-old boy and three good Missouri mules aided by a modern self-binder will cut and bind six to eight times as many acres of wheat as the two men could do forty years before. The two men harvesting wheat in the good old way needed but little capital but they needed a lot of time if they had much wheat to harvest. Today one man or a boy using an equipment of machine and horsepower costing $600 or $700 will do what it required twelve men to do under the old regime. But that is not all. Any one who has followed the old scythe and cradle in the harvest fields knows that enough wheat was wasted to have more than seeded the ground for another crop. It is at least safe to say that compared with the old method of harvesting wheat with scythe and cradle that the self-binder pays for itself in grain saved when it has harvested two hundred acres. In the early days of the self-binder many a farmer bought a machine on time, paid for it in the saving of grain and labor and saved his own health and strength in the bargain.

Horsepower Expense Has Increased

We hear men today offering some of the same objections to the farm tractor that have been made against practically every improved machine now in common use on the farm. One of the first objections urged against the farm tractor on the medium size farm is that it costs too much. That objection had some weight a few years ago when the farm tractor was a large, cumbersome and expensive machine that could be put to practicable use only on very large farms, but as horses and mules have advanced and as the cost of feed very greatly increased the expense of keeping farm teams, manufacturers have improved their opportunity and have built farm tractors suited to the medium size farm and at a moderate cost. The farm tractor is not going to displace horsepower on the farm, at least not for a long time yet, but it is here to supplement horsepower and to do work that the horse can not do.

One of the first advantages of the tractor over the horse is in the saving of labor and expense when not in use. It costs a great deal to keep a horse when hay is worth $10 or $12 a ton and corn 60 to 70 cents a bushel. If we could work our horses in winter and let them go idle in summer we could greatly reduce the cost of keeping by turning them on pasture, but unfortunately for this we have little use for horses in winter time when they must be fed hay and grain and when spring work comes on they must be fed hay and grain and we can not escape the heavy expense.

After the tractor has plowed through the long hot July and August days it is ready to pump the water, grind the feed and saw the wood without grumbling. The above tractor is an "Avery" made in Peoria, Illinois.

The Horse Eats When Idle

A recent investigation made by the University of Missouri gives the cost of keeping a horse in this state as $88.33 a year. This cost represents actual records kept on fourteen farms with seventy-four horses altogether. Counting up this cost against 312 work days in a year we have a daily charge of more than 28 cents for keeping a horse whether idle or at work. On 20 farms records were kept showing the time the horses were employed and the time they were idle. Counting ten hours to the day the horses on these 20 farms were at work 112 days and were idle 200 work-days. If in place of the horses we use the tractor, a small tractor that will do the work of five horses, then for every idle day we effect a saving in expense of $1.40 less the interest on the cost of the tractor.

The Tractor Never Tires

The last decade has seen a marked progress in the use of draft horses for farm work and a corresponding decline in light horses. This has been brought about by necessity. The larger use of machinery displacing hand labor, the use of larger machines, and the knowledge of the value of deeper plowing and better tillage have all contributed to the displacement of light horses by draft horses. For these same reasons the farm tractor will find its place on the farm. While the depth of plowing is not yet a matter of exact knowledge we do know that at least an occasional deep plowing is a good thing on most soils. Deep plowing brings up added fertility, gives greater water storing capacity, affords better drainage and aeration, all of which aid in producing bigger crops. When the ground is dry and the days are scorching hot there are few plowmen so inhuman that they will not lower the clevis a notch or two to lighten the burden of an overworked faithful horse.

The oil tractor is the world's greatest plowman. The deep, smooth furrows are a pleasure to the lover of good farming. The above machine is one of the many tractors made by the International Harvester Company of America.

How many farmers using horses for power who will plow seven to nine inches deep when the ground is dry and hard in July and August? Not many, I should say. At the Kansas Experiment Station it has been proved by three-year trials that land plowed 7 inches deep on July 15 produced 6.34 bushels of wheat an acre more than land plowed on the same day and treated in the same way except that it was plowed only 3 inches deep. These trials run through the years 1911, 1912 and 1913. For the year 1913 the difference in favor of the deep plowing was 13.38 bushels an acre, an amount that would practically double the wheat yield of this country.

Early Plowing Doubles Wheat Yield

Most good wheat raisers realize the value of early plowing and thoroughly working down the seed bed but owing to rush of other work and the need of the horses for finishing corn cultivation, haying, etc., it is not always possible to neglect the other work and do the plowing at the right time. Here is where the tractor will serve the wheat raiser to good advantage. In the series of trials above mentioned at the Kansas station, land plowed September 15th to a depth of 7 inches produced an average for the three years of only 14.15 bushels as compared with 27.11 bushels on the field plowed July 15. This is a difference of 12.96 bushels per acre, and it would not take a very large acreage of wheat at this difference to pay for a good farm tractor outfit.

The early plowing of stubble ground and frequent cultivation of the seed bed has been mentioned in frequent articles in The Missouri Farmer as a means of preventing damage from Hessian fly. The Hessian fly does not feed very generally on any other crop except wheat and where the wheat stubble is plowed deep and plowed early and all volunteer growth of wheat kept down the fly damage is reduced to a minimum.

Another decided advantage of the tractor is that in emergencies it can be worked 15, 18 and even 24 hours a day without injury. Ten hours is a good days work for a horse and twelve hours about the limit but by crowding the gas tractor through long hours for a few days the plowing may be finished in the best time and the job is out of the way of other work on the farm. Often the time for plowing wheat ground is the very hottest season of the year and under such

conditions horses can do little more than half work, but hot weather is no handicap for the tractor. The driver can ride very comfortably in the shade while the tractor will move along all day indifferent to the scorching rays of the sun.

An item of more importance than usually recognized is the labor necessary to care for work teams both when they are at work and when they are idle. The farmer who uses a team of four or five horses to do his farm work does not need to be told that it requires a considerable amount of time and energy to go to the barn, feed his horses, groom them, harness them, water them and get them ready for the day's work. In comparison the farm tractor may be utilized morning, noon and night to lighten the farmer's labor. While the farmer is eating his meals the tractor may be utilized to pump water for the cattle or to grind the grain for the hogs. On

The Bates Steel Mule, Joliet Oil Tractor, Company, Joliet, Illinois

bad days it may be utilized to saw the wood, drag the roads and in season will drive the ensilage cutter and fill the silo. The farm tractor has already demonstrated its value in the economy of farm management and other work will be found for it to do as its use becomes more general.

The farmer who is planning to buy a tractor should investigate carefuly, buy of a reliable company and buy only that machine which the company is willing to back with a good guarantee. If the company is responsible and gives a good guarantee of the quality of work the machine will do, the buyer is taking no risk when he gives the tractor a trial. A prominent manufacturer gives this advice to buyers: "In buying a horse, you consider first the quality of the horse and then the price. So in buying a machine you should consider first the quality of the machine and then the price. * * * It is not by any means always the most advisable thing to buy the cheapest horse, and the same applies to machines. It is a question of getting the biggest dollar's worth of value for your money, rather than the exact amount of money you invest." This is sound advice for the man who is buying any kind of a machine. The life of a machine and the quality of the work it will do will determine its worth in the end and these are the first things to consider when you are ready to buy a farm tractor.

Those who object to a greater use of labor-saving machines on the farm should ponder over this fact: The best arranged, best improved and most profitable farms in about nine cases out of ten are the farms where the latest improved farm machinery is utilized to its fullest extent.

FEEDING THE UNBORN PIG THE ALFALFA WAY

How shall we winter the brood sow most economically and efficiently so as to have strong, lusty litters of pigs that will "save" and suckle well in the springtime? The answer is to use largely corn plus alfalfa. Of course common salt should be allowed by all means, giving the sows free access. Wood ashes are a most excellent swine feed, and prairie farmers are unfortunate in that they have so few of them. But cob ashes are good, and charred cobs are of exceptional value because they furnish a form of charcoal, that hogs relish and do well with.

At the Iowa Station we have had considerable favorable experience with alfalfa as a brood sow feed. In the year 1910-11 we fed some gilts, five in a lot, the figures on the most important groups of which follow:

USE ALFALFA WHEN FEEDING THE BROOD SOW
Results of Animal Husbandry Section of Iowa Experiment Station

Ration Fed	Av. Daily Gain	Average Feed Eaten Daily: Corn—(Shelled Basis)	Supplement	Size of New-born Pigs. Wt. Av.	Strength of Pigs: Strong %	Medium %	Weak or Dead %	Feed Cost of a new-born pig—cents
Ear Corn only..	.35	3.65	none	1.74	68	16	16	41
Ear corn plus 13% tankage..	.63	2.75	.43	2.23	93	5	2	22
Ear corn plus alfalfa in rack	.63.	3.74	1.11	2.29	89	8	3	26

In making these charges on the new-born pigs we figured corn at 50 cents a bushel (shelled basis), tankage or meat meal $50 a ton, and alfalfa hay at $10. The surplus gain left after farrowing as compared to the time of breeding is credited in all cases at $5 a hundred pounds. Thus the costs given are really net feed costs, crediting the gain value. The charge on the gilt as a breeder begins at breeding time.

Gratifying, is it not, to note that the **unborn** pigs fed corn and alfalfa through the dam came strong, of good size at a relatively low cost? Generally speaking, loose alfalfa on the farm is not valued at $10, the charge made. Any reduction from this figure will lessen the cost of the corn-alfalfa produced pigs, making it less than 26 cents. The corn alone pigs cost 41 cents each, and many of them were dear at 20 cents, light coated, small "boned," weak "voiced," miserable creatures of a fateful destiny that they were.

Meat meal tankage, even though costing $50 a ton, is a relatively economical feed to balance corn with because of its great effectiveness per pound of weight. It is very, very rich in exactly the materials that corn is poor in. Furthermore it contains a minimum of starchy like elements so abundant in corn, and this is well. Why haul back to the farm that which you already have an over-supply of, such as the starches?

What happened in 1913-14 with the rations, including alfalfa, which we fed? Here are the Ames figures on the same:

EFFECT OF RATIONS FED GILTS ON RESULTING LITTERS

Ration	No. in Litter	Size and Av. Wt.	Av. Circumference of shins, fore and hind, inches	Strength of Litters Average 100—perfect
Corn only	5.6	2.12	1.86	79
Corn plus 200% buttermilk	9.8	2.23	1.85	88
Corn plus 140% ground alfalfa	9.6	2.19	1.86	88
Corn plus alfalfa rack	7.6	2.13	2.00	92
Corn plus 10% meat meal	8.8	2.48	2.01	95

In spite of the fact that the "corn sows" protected themselves (and the word "protected" is used advisedly) in that they fertilized but 5.6 ova on the average, yet the pigs are not as large, nor so strong as when suitable and efficient supplements are used. Buttermilk, meat meal and alfalfa, ground or whole, are superior supplements to corn grain. Salt was allowed at free will, all lots.

The feed eaten and gains on these gilts ran as follows:

SUPPLEMENTS FOR CORN SHOW GOOD GAINS

	Average Daily Gain	Corn Grain	Supplement	Costs per day at 5 cents crediting gains
Corn only	.37	4.11	none	1.82
Corn and buttermilk	.51	2.84	5.83	1.45
Corn and ground alfalfa	.50	2.11	3.00	1.49
Corn and whole alfalfa	.50	3.94	.48	1.26
Corn and meat meal	.49	3.24	.33	1.27

*Corn 50 cents (if ground 53 cents a bushel); buttermilk 25 cents cwt.; alfalfa $10 (if ground $12); and meat meal $50 a ton.

It is quite suggestive that all gilts receiving supplement to corn should make cheaper maintenance figures—suggestive that corn as the lone grain is inefficient physiologically (low gains) as well as economically (highest maintenance cost of all).

That the meat residue called tankage or meat meal should do so well is not particularly surprising because in all feeding trials at the Iowa Station it has uniformly been of much merit. The $50 a ton looks **big** but the superiority of the animal feed is not to be questioned. A happy combination of alfalfa and meat product should be ideal in physiological as well as economical virtues. This is especially sifinificant if alfalfa is worth more than $10 or $12 a ton.

We have experienced some difficulty in getting some sows to eat sufficient alfalfa out of the rack in order to insure the "kind of litters hog men want"—hence the reason of our grinding procedure. The ground alfalfa mixed with ground corn most assuredly is a "sure shot" mixture, and one worries little about a lack of consumption under such a regime of feeding. One year our yearling sows farrowed weak "corn alone sort" of litters because they simply ignored the alfalfa in the rack, good quality though it was. This word of caution may not be amiss: Be sure your gilts and old sows carrying litters eat at least a half pound, better over a pound, of alfalfa daily; otherwise, if the deficiency is not remedied somehow, there'll be regrets expressed on farrowing day.

Corn, alfalfa and meat meal tankage should make a very exceptionally good trio of brood sow feeds if happily combined. A suggestive ration which would be quite economical would be to give the sows, gilts and older ones, enough corn to keep them in good condition, adding alfalfa in a rack and giving them about 1-5 to 1-4 pound of meat product daily. The alfalfa may be ground and mixed with corn, say 100 pounds corn to 100 pounds alfalfa, and same allowed in a self-feeder. An average gilt of 250 pounds will eat about 5 to 6 pounds of this daily, so to get the necessary tankage into it mix with every hundred about 5 pounds of this meat product. If the sows get too fat, increase the proportion of ground alfalfa accordingly—the results should be happy ones at farrowing time. Don't forget the common salt at free will, and plenty of good wholesome water.

John M. Evvard and Russell Dunn,
of the Iowa Experiment Station.

NEXT YEAR'S WHEAT CROP

Whether or not any particular farmer will find it profitable to grow wheat at all is to be determined only by himself. While upon the whole we think statistics will show that live stock farming is generally more profitable in Missouri than wheat raising, yet there are few farms where wheat does not fit in nicely occasionally to keep up the rotation, to furnish a nurse crop for seeding timothy and clover and perhaps a minor consideration is to grow a crop that will pay its way and at the same time furnish bedding for the live stock. The latter is perhaps of more importance than most farmers realize when it is known that about one-half the value of manure is in the liquid form and without a liberal supply of bedding most of this part of the manure is wholly lost.

But this article is not written to encourage farmers to sow or not to sow wheat but for those who are going to sow to try to point out how they can improve upon the ordinary methods of growing wheat and increase the chances for a bigger yield The writer realizes that there are many difficulties in the way of doing everything at the right time on farms where a mixed system of farming is carried on but possibly if we knew just how much more profitable it generally is when growing a crop of wheat to do certain things on time we could find a way to do it even at the neglect of other work. A difference in methods that will make a difference in yield of six to ten bushels per acre is worthy at least a careful consideration and some extra effort to bring about.

The best wheat raisers in the winter wheat belt invariably understand the value of a good seed-bed in raising wheat, yet in passing through the country most any season any observer will see that much of the crop, generally the bulk of it, is planted on land poorly prepared. It is not only necessary to have the soil fine but it must be thoroughly settled with a couple of inches of mellow surface for planting the seed. This condition can not be obtained in a day or a week but it requires considerable time and hence the necessity for early plowing. The experiment stations did not discover the fact that early plowing was best for wheat for good wheat raisers had learned this long before the first experiment station was established in this country.

But some of the stations have by numerous careful and accurate tests proved that early plowing for wheat will produce a bigger yield than late plowing. Another fact that has been

discussed for at least fifty years among wheat raisers is that it is better to sow wheat in rotation with other crops than to sow it continuously on the same field for a number of years. Farmers have learned this fact by experience and observation and the experiment stations have proved it and have given us the scientific reasons for it. In the face of these facts we find some farmers who persist in sowing wheat after wheat for a number of years on the same land and then when disaster comes they wonder why insects are getting worse and other causes prevent them from getting the yields they once did.

Now as to the difference between early and late plowing for wheat, the Kansas station has found as a result of numerous trials that land plowed in July produced 2.12 bushels per acre more wheat than land plowed in August. In some cases the difference was greater but this was the average of all trials. A man sowing twenty-five acres would on this basis earn 53 bushels of wheat by getting his land plowed in July rather than waiting until August and the longer he waits after July the greater will be his loss. The trials at this station gave 15.23 bushels per acre more wheat on land plowed in August than the same kind of land produced which was plowed in September. And so it is that the man with twenty-five acres for wheat will have 380¾ bushels more wheat if he will crowd his work and plow the land in August rather than wait for the hot days to pass and plow it in September. If we compare the July and September plowings there is a difference on this basis for twenty-five acres of 434¾ bushels which is more than some farmers get for their whole year's work. As we have already stated farmers can not always let their work of plowing corn, making hay, etc., go undone, but for this amount of extra pay they can afford to put on a little extra labor or work a little over time to get the wheat land plowed early.

The depth of plowing is not so important as the time of plowing and yet it is necessary in whatever system of farming we adopt to occsaionally, that is once in every four or five years, to plow deep. Where a rotation is followed there should be at least one deep plowing during the four or five years of the rotation.

Early plowing for wheat has another advantage and that is that it is the best plan for the control of the Hessian fly. For this purpose, however, the ground must be kept thoroughly cultivated and all volunteer wheat kept down. The early plowing will turn under the fly while yet in the "flax seed" stage and thus destroy most of them and if the ground is kept thoroughly worked and no volunteer wheat allowed to grow there will be little danger from fly in the next crop unless they come from some other field.

Another matter of importance in growing wheat is proper fertilization even on land in a good state of fertility the right kind of fertilizer will usually pay a profit. Fertilizers not only usually increase the yield directly but by hastening the ripening a crop may be saved from rust or damage from a wind storm and by stiffening the straw a fertilizer may save a crop from lodging and serious loss. The kind of fertilizer to use will depend upon the type of soil as well as the way the land has been previously handled. One thing is certain, however, and that is that a high grade fertilizer bought from a reliable manufacturer is always to be recommended over a cheaper grade. Where a brand has been used in the neighborhood with good results it is generally safe to use it, and it may save the farmer money to write the experiment station for suggestions before buying.

THE ONE-MAN TRACTOR FOR EVERY MAN'S WORK

Judging the significance of an invention by the number of people whose lives are affected by it, the self-binder has never had a serious competitor for first honors in the field of agriculture invention. Through its influence on the price of bread and other grain foods, the harvesting machine has influenced the life of every individual. Without it, practically the entire population would be required at harvest time to gather sufficient grain for the year's food supply.

Now comes another development which bears the traits of an epochal invention and which, it seems probable, will be second only to the binder in economic importance.

With the appreciating cost of horse flesh, of feed, of farm help, and of interest charges on land, the cost of producing crops has lately become so considerable as to imperil farm profit. According to figures issued by the Department of Agriculture based on a test of 5,000 typical farms, the average cost of raising an acre of wheat is $11.15, of which the labor item is $5.38. When it is considered that the ten year average farm value of an acre of wheat to the Montana farmer is $19.98, the serious nature of farm labor costs and the small margin of farm profits become apparent. Carrying these figures out for oats, the average cost of production per acre is $11.91, with the labor item $4.73, and the ten-year average value $18.90.

In examining into the causes of this situation, it becomes evident that most of the blame may be attributed to the inefficient character of horse power. F. L. Peterson of the University Farm, Davis, California, has estimated that a horse must be fed and cared for 9,000 hours for every 1,000 hours it serves, and that one acre out of five under cultivation is required to provide feed for the horses and mules. The thermal efficiency of the horse is quoted as not more than six to ten per cent.

A remedy which for some years has been applied successfully to the farm of many acres is the substitution of oil for horse power. Some of the large farm machine companies have spent millions of dollars in perfecting tractors which will consume cheap fuels and which will apply to the multiplicity of farm tasks. The success with which this substitution has been made was discussed by the Kansas Farmer in its issue of January 9, 1915. This publication estimates that 79 per cent may be taken from the cost of belt work by the substitution of a tractor for horse power, 69 per cent from the cost of hauling wheat, 56 per cent from the cost of plowing under ordinary conditions, and 23 per cent from the cost of harvesting.

"Our figures are only comparative," says the Kansas Farmer, "but they will serve to show the saving a tractor makes, and whether costs (in different localities) are higher or lower, we believe our percentage will hold."

The presence of such optimistic achievements by large tractors on large farms impels the conviction that the application of oil power as a tractive and motive force to the small and medium sized farm will affect the costs of producing the world's food and enhance the profits of the world's farmers. The development which has made this application possible is the one-man tractor with a grip on the earth of eight mechanical horse power and a driving force of sixteen horse power at the belt. The tractor is 4 feet 8 inches wide, about 5 feet high, weighs 5,000 pounds, and has a wheel base of 90 inches, which is less than the average automobile. The tractor can turn in a circle with a radius of 10 feet, which enables a farmer to plow practically every inch of his field. The danger of packing the soil with the machine is negligible, as its weight per square inch on the ground is only 10 pounds as contrasted with the weight of a horse which is 20 pounds. The tractor has three forward speeds of 1 4-5 miles, 2 miles, and 2½ miles per hour.

The 8-16 horse power tractor will pull two 14-inch plows, and in doing this work will consume not to exceed four gallons of kerosene per acre. The drawbar activities extend to all the processes connected with planting, harvesting, threshing, and delivering the grain and hay crops, with the possible exception of cultivating corn. It will draw disk harrows, manure spreaders, binders, corn-binders, mowers, hay loaders, drills—all machines which are drawn by horses.

In addition to supplanting the horse at the drawbar, this tractor will operate every machine on the farm to which a pulley and belt can be attached. It will drive a small thrasher, an ensilage cutter, a feed grinder, or a sheller. It will run an irrigation pump, operate a husker and shredder, and furnish power for every machine on the place. It will go from one task to another from the week's or year's beginning to its end, and is no respecter of its work. In view of the fact that it does so great a variety of work which horses could not do, it would not be necessary for it to supplant a great deal of horse power in order to pay for itself. It will supplant this horse power, however, and substitute a highly organized, highly efficient form of power for the one which has been consuming the farmer's profits.

The fuel equipment of the 8-16 H. P. tractor is characteristic of the way it has been planned and manufactured as a money saver to the farmer. It will burn gasoline, kerosene, and distillate equally well, thus enabling the individual user to take advantage of the fuel which is cheapest in his community.

The 8-16 H. P. tractor is not a large tractor made small, but it has been devised and created as a distinct development. Its mission is to universalize oil power and make it adaptable to the farm of the common man. For the first time in history, oil power has become generally available, and the machine which has achieved this may justly be termed one of the most significant inventions of the age.—George F. Whitsett of the International Harvester Company of America.

About the best way we know to beat the wheat speculators is for farmers to stack their wheat and let it dry out thoroughly and then it can be kept until the market suits.

HOW TO GET RID OF HOG CHOLERA

J. W. Connaway, D. V. S., M. D., Veterinary Department, College of Agriculture and Experiment Station, University of Missouri.

[This article is a continuation of the article in our June 15 issue and will be continued until the whole subject of hog cholera control is thoroughly discussed. We suggest that every swine raiser who reads The Missouri Farmer should file away all these papers containing this article and they will then have the most valuable treatise on hog cholera that has been published.—Editor]

(2) **Notification:** Publicity is an important aid in the prevention and control of hog cholera. And it is the duty of every swine raiser to prevent the spread of the disease from his own premises in every way he can, if the disease should attack his herd. The owners of adjoining farms should be notified of the danger, in order that they may take all the precautions possible against the disease. The simple precaution of removal of a herd to another part of the farm, may not only prevent losses in a neighbor's herd, but prevent the formation of a new focus of infection, for the further spread of the disease. A neighbor may have a lot of fattening hogs that are almost ready for market, and prompt notification of the danger may save the neighbor hundreds of dollars, by showing him the advisability of marketing his hogs a few days earlier, or by removing them to safer quarters, in the case of his breeding hogs, and vaccinating them if that seems advisable. In the past, many farmers neglected this matter of notification of the neighbors, although the law prescribes that it shall be done. The spirit of co-operation that is developing among the farmers to help one another, is rapidly correcting this matter.

Notification of the Veterinary Department of the College of Agriculture that hog cholera serum is needed for the control of the outbreak will bring a response from that department with sufficient serum for the purpose, and such instruction and official aid as lie in the province of that department. The new $50,000 serum laboratory will enable the department to meet promptly every proper demand for serum.

In the event of the infraction of the laws, relating to the disposal of hog cholera carcasses, or when services, requiring the application of official quarantine or veterinary police measures are necessary, the State Veterinarian should be notified; as it is the function and duty of this officer to investigate and prosecute such infractions. Or the prosecuting attorney of the county may be notified. Every neighborly effort to correct illegal and dangerous practices, or negligence, should be exhausted before resorting to drastic measures. Our experience with the plan we have in operation shows that resort to law is rarely necessary.

(3) **Disinfection:** One of the most important matters for the farmers to consider in the work of preventing and eradicating hog cholera is that of "disinfection." Precautionary measures in the way of a frequent "clean-up" of the feed lots and hog houses, and a proper disinfection of the same are advisable, and especially at times when cholera is prevalent in the district. The destruction of the seeds of the disease, or virus of hog cholera, is essential to success in eradicating hog cholera. The oldest and most efficient means of destroying disease germs is fire, and it is especially recommended for the destruction of hog cholera infection. The carcasses of hogs that have died from cholera are particularly dangerous, as disease producers, and should be destroyed by fire. It is obligatory under the law to **burn all hogs that have died of any disease.** The law presumes that they are capable of producing outbreaks of some contagious disease. The old law that permitted the burial of hog carcasses was repealed by the Legislature two years ago. Not only should the carcasses of hogs be burned, but the carcasses of dead animals of all kinds should be burned, since they attract infection carriers, like dogs and buzzards that may have fed upon a carcass of a hog that has died of cholera on a distant farm. The destruction by fire of the carcasses of hogs is not difficult, it is easier than to bury them. The essential thing is to have a good under-draught, this can be secured by scooping out a shallow trench and placing across it a few bars of scrap iron to hold up the carcass; an old mower wheel or a discarded iron harrow frame answers the purpose well. A small

Burning the Dead Hogs

amount of wood and kindling put under the hog, and a little kerosene pourned over it, is all the fuel that is needed. Several longitudinal cuts should be made through the skin and fat, and the belly and chest cavities opened so as to expose the internal organs to the heat, turn the belly down. The fat in the carcass adds fuel to the flame. Fire however cannot be applied under all circumstances as in the case of infected barn yards and feeding pens. **Chemical disinfectants,** therefore, have an important place. Among these, **caustic lime** has the highest value, for practical purposes, in the destruction of hog cholera infection. It is cheap and easily applied, and when used freely is very effective. The lime should be purchased in the barrel, in the form of the unslacked burned limestone, and should be used freshly air-slacked. The head of the barrel can be removed and the lime-rock emptied on a dry place under shelter, then sprinkled slightly with water to start the slacking process. When slacked sufficiently to admit of scattering freely with a shovel it is ready for use. Infected feed lots should be disinfected as follows: Pieces of boards, rails, corn stalks, cobs and other rough litter lying around in the infected feed lots should be piled up on the middle of the lot and burned. Then lime should be spread thickly over the ground, so that the ground will look as if covered with a light snow. If large feed

Use Plenty of Lime

lots are to be covered, a lime spreader may be used. But a wheelbarrow and shovel answer the purpose well enough even for large feed lots. Keep stock off the ground for a few days then scrape up the manure into "windrows" by means of a two-horse board scraper (home-made). Scatter more lime on the windrows, and shovel the manure and lime into rounded piles, sprinkle more lime over these piles, and let them stand for a few days. The addition of a little water to these piles is advisable if the barnyard manure is dry This will start the slacking and heating process which will effectually destroy the hog cholera germs. The eggs and embryos of five or six different kinds of worms that commonly infest hogs, and occur in hog dung will also be destroyed by the lime. The manure and lime will help to sweeten and fertilize the soil, where you intend to start an alfalfa or clover field. The money spent for lime is not wasted. The cleaned feedlots should be covered again with another dressing of lime. The hog houses, cots and fences should be white-washed inside and outside with

Compound Cresol Solution

a hot lime-wash. The Compound Cresol Solution made according to the U. S. Pharmacopeia has been found by laboratory tests at the United States Bureau laboratories to be one of the most efficient chemical disinfectants for destroying hog cholera germs and may be applied in the form of a spray. Mix 1 pint to 3 gallons of water. This is useful in disinfecting wagon boxes and hog crates, and walls of hog houses. Lime, however, seems to be preferred by most farmers, especially for use on the grounds, and its reliability has been thoroughly demonstrated both by laboratory and field use. Besides it has an advantage over the cresol, and the ordinary carbolic stock-dips, in being of value to the soil instead of harmful. I may mention that one of the best swine breeders in the state was able to restock his breeding quarters within sixty days after having had severe losses from cholera. He used nothing but fresh air-slacked lime, but he did a thorough job. An experiment was made by the Veterinary Departmen of the Experiment Station in the disinfection of an infected pen, in one of the local railroad stock yards (a pen in which a number of hogs had died from cholera) this pen was treated to an application of fresh air-slacked lime. In a few days six pigs were turned into the pen, and fed there for three weeks. They did not receive any medical treatment nor special care, no symptoms of illness had developed at the end of the period. These same pigs were put in a clean pen for a few weeks at the State Farm for further observations; none showed any signs of cholera. Then, as a test of their susceptibility, they were exposed to infected pens at the serum plant. They promptly took the disease, and nearly all died. This experiment demonstrated that quick-lime or freshly air-slacked lime is an efficient agent in disinfecting badly contaminated hog lots in the stock yards.

Sunlight a Good Disinfectant

The ordinary carbolic dips and disinfectants are not as efficient, in destroying hog cholera infection as the Compound Cresol Solution, according to tests made by the U. S. Bureau of Animal Industry.

The thorough disinfection of large fields, pastures, and woodlands, by means of chemical disinfectants, such as lime and Compound Cresol Solution, is of course impracticable, yet such fields can be made safe for susceptible hogs. If hogs are kept out of infected fields for a sufficient time, the germs of the disease die out. The germs do not seem to have the power of growing outside of the body of the hog. Although the life of the germs may be conserved for awhile outside of the body if conditions are favorable. It has been observed that the hog cholera infection dies out more quickly in open fields well exposed to the rays of the sun than in moist, shaded places. The cholera germs on exposed grounds are killed quicker during the summer months than in winter. Strong sunlight is a good disinfecting agent for a number of disease germs, and among them hog cholera. It is advisable to put cattle, horses or sheep on the cholera infected pastures, and let them crop the grass closely, so as to give the grounds a good exposure to the hot rays of the summer sun. Hogs are not so liable to contract cholera in the large fields as in the smaller feed lots, since the infection would not be so concentrated, so far as the droppings from sick hogs are concerned. The more thorough disinfection of the large fields and pastures can be assured by making a search for carcasses of pigs, and for the bedding places that sick hogs have used. Fire and a little lime can be used to advantage in destroying the cholera germs in these.

The time required for the cholera infection to die out on large fields and pastures will vary with the conditions of weather and soil, and exposure to sun, as well as the degree of infection. Under the most favorable conditions large fields that have become infected will probably not be entirely safe for susceptible hogs under 90 to 100 days, though cases are reported where infected fields were apparently free from the infection in less time.

Every possible effort should be made to prevent large fields and pastures from becoming infected with cholera germs.

(To be continued next issue)

THE DAIRYMAN'S DANGER

The indications are that the foot and mouth disease is under control in this country at the present time. The expense of stamping out this dread epidemic has been enormous. There has also been much loss because of quarintine regulations prohibiting the moving of live stock. When we consider that this is the most contagious diease known among animals and the many sections of the United States in which outbreaks occurred, we should be thankful our losses were no greater. The disease was prevalent in three states adjoining but Missouri did not have a single case thanks to quarantine restrictions and their strict enforcement by our state authorities.

There was considerable falling off in prices at cattle sales during the winter and spring, due entirely to the foot and mouth trouble, but with the assurance of its elimination come better prices and an increased demand especially for dairy stock, and it looks as though normal conditions will soon prevail.

No doubt that a general realization of the seriousness of this malady with earnest and effective co-operation of all forces was the cause of getting such splendid results, and now the stock breeders should realize the seriousness of tuberculosis and contagious abortion in cattle in this country and make a united effort to rid our herds of these troubles. Neglecting to do this is causing the loss of hundreds of thousands of dollars annually, and as these diseases are contagious their prevalence will not grow less without effective efforts are made toward elimination. Probably the most common way of spreading these complaints is through buying what is supposed to be healthy cattle at sales. Too often these cattle are infected; they are turned with healthy cattle and in a very short time the contagion has spread throughout the entire herd. Buyers should exercise every care to know the cattle they buy are entirely free from communicable diseases.

E. G. Bennett,
State Dairy Commissioner.

FARM LOANS AND CREDITS

On the continent of Europe where farmers are able to get money at as low a rate as the government gets it, says Col. F. D. Gardner in a recent address, at the inception of land credit institutions these organizations were aided and are still aided by the government.

The earliest record of long time loans was the system established by Frederick the Great in Germany about 150 years ago, at which time he made an appropriation from state funds of $432,000.00. The latest is that of the English government which has floated one billion dollars worth of agricultural bonds, and this money is loaned to the Irish farmers at 3% plus ½ of one per cent per annum, or a total of 3½%, which amortizes or pays off the loan in 68 years. These are examples of the oldest and newest rural credit institutions abroad. In Ireland the rural population was formerly nine million, but under a system of tenantry, and the inability of farmers to secure money for the development of agriculture, the population decreased to four million. Since this new system was put into operation four years ago the rural population has increased by 500,000. The Secretary of Agriculture in Ireland told me that one million farmers had availed themselves of loans, and that the government had not lost a single cent because it in turn had re-sold the bonds on the market without loss to itself. This money, of course, has been deposited with banks and used for purchasing building materials, farm machinery, fertilizer, etc., and it has brought about general prosperity to all classes of people.

What would be the term of the loan under the Gardner Land Bank Bill? The law provides that the loan may be for five to twenty-five years. That the rate of interest will be 4.3 per cent with ½ of one per cent to be added to pay expenses and to create a reserve fund and that 1.7 per cent would be added on account of principal, making a total of 6½ per cent, which would retire the loan in twenty-five years paying off the interest and principal in full. Whatever expense there would be to the state would be taken out of the ½ of one per cent but there should be very little other than the cost of the appraisal and clerk hire, as the bank would be under the management of the State Bank Commissioner without additional salary.

It has been stated in a previous issue of The Missouri Farmer that a St. Louis manufacturer can secure money from New York at 3½ per cent while the farmers of Missouri are paying 8 per cent or more and that is true. The money that is now lying idle in New York was produced by the agricultural people of this nation. And yet this national government has failed to provide financial machinery whereby this money may be returned through the sale of agricultural bonds to the rural districts. In other words, the farmer may not have the use of wealth which he himself has created on equal terms with the merchant or manufacturer. We must all acknowledge that the wealth of the nation is produced from agriculture. Does it not follow, therefore, that the farmer should have the money on equal terms with any one else?

You ask, "What benefits would be derived from a state bank financed and controlled by the state?" The benefits would be simply this: The great sums of idle money now lying in the large financial centers would flow out into the agricultural districts. The National City Bank of New York has 325 million dollars; the National Reserve Bank of New York has 250 million, and so on. Money was never so plentiful in the large centers and never so cheap. On the other hand, it was never so scarce and never so high as at present in the rural districts, showing that an intermediary of some kind is needed, and that intermediary must be state bonds. The state does not guarantee the bonds. It merely loans the capital and manages the bank.

If through that process we can bring one or two hundred million dollars of new capital into the state do you not see the immense benefit it will be to all classes of our people? The money will immediately be utilized by the farmer for productive purposes. It will mean an increased yield per acre, increased tonnage for the railroads, increased deposits for the commercial banks, increased business for the merchant, and an increase in food supplies, which the large cities now need so much. It will keep the boys on the farm instead of their being forced to the cities to become strap-hangers and inmates of boarding houses. In addition to all of these benefits, it will prevent the large number of unemployed in the cities from forcing a collapse of the wage schedule, which, in my opinion, would be very disastrous to the country. With so many thousand men out of employment in the cities, how much longer can the laboring people maintain a high wage scale?

HEALTHY ANIMALS MAY SPREAD DISEASE

The medical profession has known for a long time that one of the menaces to which health is exposed is the infectious material often carried and unconsciously expelled by seemingly healthy persons and animals, but the true importance of this fact has begun to receive the wide recognition it merits only in recent years.

Today we know that many persons after recovery from typhoid fever continue to discharge typhoid germs from thier bodies and that such persons cause numerous cases of typhoid fever unless they are properly controlled, and we know that exposure to diphtheria, even when it does not lead to the development of disease, means that the exposed individual often becomes a carrier of diphtheria germs, which are located in his throat, a region from which they are expelled in a way dangerous to the health of susceptible persons. And we also know that this same problem of seemingly healthy carriers and disseminators of disease germs must be given careful consideration because of its bearing on the health of our domestic animals.

The possibility that animals may become persistent carriers of disease germs is not limited to any one or any kind of disease. For example, if we take three diseases, southern cattle fever, infectious abortion of cattle, and foot-and-mouth disease, we have one which is caused by an animal micro-organism, one by a vegetable micro-organisms or a true bacterium, and one by an undistinguished, probably ultramicroscopic organism or a germ too small to be seen, even with the aid of the most powerful microscope. Regarding southern cattle fever, the Bureau of Animal Industry proved some years ago that recovered cattle continue to carry its specific cause in their blood for years, so that the injection of a small quantity of such blood under the skinf o a susceptible animal almost invariably causes a typical attack of southern cattle fever. Fortunately, this disease is not transmitted through contact directly from animal to animal; the only known method of transmission under natural conditions is through the agency of the cattle tick. Later the bureau demonstrated that cows affected with abortion disease, long after they have seemingly recovered and resumed the normal production of calves, continue to expel abortion bacilli with their milk. One cow now under observation has continued to discharge such bacilli with her milk without showing a symptom of disease for more than six yeas. And recently the claim was made by European investigators that animals recovered from foot-and-mouth disease may expel the infectious material of this serious plague as long as eight months later.

There are other diseases of which it is definitely known that seemingly recovered cases remain carrier of their specific causes, but it is unnecessary to speak about them here, as the object of this short article is to call attention to a source of danger in a general way rather than to discuss it in detail.

We may say that what is true of three infectious diseases, the character and specific causes of which are as dissimilar as those of the three named, must be assumed to be true of all infectious diseases until the contrary is proved; hence, that animals which have recovered from or have been exposed to infectious diseases must be regarded with suspicion. Farmers and animal husbandmen often can avoid serious trouble among their animals by making careful inquiries relative to the history of the animals they contemplate purchasing for introduction into their herds or flocks. The purchase of an animal lacking a clean bill of health from its birth until the time it is offered for sale, or of an animal from a herd or flock in which an infectious disease is known to have occurred, should be regarded as courting trouble.—Bureau of Animal Industry, U. S. Department of Agriculture.

"The Kodak on the Farm."

FOR the sake of showing the *business uses*, the home appeal and the pleasures to be derived from picture taking we have published a beautifully illustrated little book under the above title.

Its forty-eight pages are largely filled with pictures—pictures of the kind you would like to take and *can take*—with a Kodak.

Ask your dealer or write us for a copy of "THE KODAK ON THE FARM." There is no charge.

EASTMAN KODAK COMPANY,
454 State Street, ROCHESTER, N. Y.

THE CORN ROOT-APHIS

Thousands of dollars are lost to the farmers of Indiana every year by reason of the depredations of this insect. It belongs to the sucking class or true bugs, and does its work on the roots of the corn plants, where it sucks the life out of the plant. Being wholly under ground, it is difficult to reach with insecticides.

These aphids are usually attended by ants, as the latter are very fond of the "honey dew" which is given out by the aphids through two little tubes, which are situated on the back of the adult insect. The ants even gather up the aphid eggs and store them in their nests where they are cared for during winter. During April and May, as soon as the smart-weed and foxtail-grass make their appearance, these eggs begin to hatch and the ants carry the aphids and colonize them on the roots of these plants. As soon as the young corn plants are well started, the second brood of lice begins to appear and the ants transfer them to the corn roots where they continue to increase with great rapidity, and to suck the life out of the corn plants.

Remedies.—It is evident from the above, that the land seldom becomes infested with these aphids until the second or possibly the third corn crop. If, therefore, a three or four-year rotation is practiced in which corn appears only once, there will be but little damage done by the insects. Then, too, the proper fertilization of the soil is of great importance, as it often enables the corn to make a crop in spite of the aphids.

As the ants protect the eggs in their nests during winter, it is a good plan to plow the field, which is intended for corn the second year, as late in fall as possible and as deeply as possible, in order to break up the ants' nests. A couple of good, thorough, deep cultivations during the month of April will also help to hold them in check. This will also assist in destroying the weeds which serve as a starter for the aphids in the spring.

Various kinds of materials have been tried with a view to finding something that would act as a repellant and so prevent the lice from attacking the plants. We have found that one hundred pounds of kainit per acre, drilled in the row at the time the corn was planted, served to almost completely protect the plants; but, owing to the European war, it is quite likely that it will be difficult to get kainit this season. Dr. S. A. Forbes, of Illinois, has found that by mixing the seed corn with a solution of oil of lemon and wood alcohol, the lice were very much reduced. This was prepared for use by mixing one part of the oil of lemon with ten parts of alcohol, and three ounces of this mixture was thoroughly mixed with a gallon of corn. This did not injure the germination any to speak of. The expense was only about ten cents per acre. At the present price of the oil of lemon, the expense would be even less. Either of these remedies is recommended, especially on black ground where the aphis is commonly found.

J. Troop,
Chief in Entomology, Indiana Experiment Station.

THE MISSOURI FARMER

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

Vol. VII July 1, 1915 No. 13

William Hirth - - - Publisher
Geo. B. Ellis - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year in Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct, always inclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

There is yet plenty of time to mature a crop of early cowpeas or soybeans and these crops will pay much better than a crop of weeds.

The farmer certainly has some cause for complaint this year but as grumbling will not bring clear weather he had just about as well make the best of it as it is and console himself with the fact that too much rain is better than too much drouth.

A few years ago we saw good sound merchantable corn exhibited at the state corn show that was raised from corn planted July 26. We have frequently seen a fine lot of feed raised from corn planted on various dates in July from the 1st to the 15th. As a rule corn planted in July will not mature corn that will do to crib but it will make the very finest of forage to feed out in the early part of the winter.

COST OF FARM EQUIPMENT

It requires more capital to equip a farm for operation now than it did to buy both farm and equipment thirty years ago. This condition presents a more serious problem for the young man just starting in farming than the older men had to deal with. Then, too, the margin of profit is very small now and it follows that if the farmer makes much headway towards owning land he must make his volume of business as large as possible. We do not want to be understood from this statement that we are urging farmers to buy larger farms because we consider that for most men quite impossible but we do mean that farmers must do a large volume of business. They are gradually doing this but not to the extent that ought to be done.

Farmers have increased their volume of business in live stock production by introducing better stock and by using better methods of feeding. A generation ago hogs were marketed at twelve to eighteen months of age and were no larger than the hogs finished now at six to ten months old. And about the same improvement has been made in cattle. The improvement in the world's transportation facilities has practically put the farmers of this state in competition with those of every other state and the farmers of this country in competition with the farmers of every other country on the globe.

The principal reason why the farmers of the United States have more than held their own in this sharp competition is in their larger use of labor saving machinery enabling one man to produce very much more in a year than the farmer who depends on hand labor. But as the country becomes more thickly populated and the land as a matter of necessity is divided into smaller farms, how are we to find a larger and still a profitable use for farm machinery? It must come certainly by co-operation. There is already a considerable amount of co-operation, but there must be more. When the amount of work on one farm is not enough to make a labor-saving machine profitable it will be better for the farmer to own a machine in co-operation with two or three neighbors than it will for him to destroy his own health by trying to do his work with hand labor. Any one who has seen the bent form at the age of forty of our pioneers who cleared the forests, fenced the land and dug the ditches, all by hand, will not want to go back to the "good old" days of hand labor.

In our leading article of this issue we call attention to some of the advantages of the farm tractor and we think that is one machine where co-operative ownership could be utilized to good advantage. While on large or even medium size farms plenty of use may be found for a medium tractor to make it pay, on the small farms it may be necessary for farmers to join together to find enough work to make the use of a tractor profitable. But will not this co-operation be better for farmers than to do like the pioneer did and kill himself off by the time he has reached the middle of his usefulness?

TAX DODGING

This is about the time of year when the assessor comes around and the newspapers are having a lot to say just now about tax dodging. We think there is less tax dodging among farmers than among most any other class not because farmers are any more loyal to the state than others but because there is less opportunity for them to keep their property hidden from the assessor. Nearly all the farmers' wealth is invested in farms, live stock and machinery, and it is no trouble for the assessor to find these things. Another thing in favor of farmers listing their property more completely than city people is in the difference in the rate of taxation.

The average total rate in the country districts is perhaps not more than $1.50 on each hundred dollar valuation but in cities the rate is much higher. If a farmer has money in the bank drawing 3 per cent interest and the tax rate of his district is $1.50 on the hundred he is required to give for public use one-fourth of the income on his money, this under the rule of listing money at 50 per cent its face. If the taxpayer happens to live in town where the rate is $3 and his money is assessed at 50 per cent the public gets one-half his income. Under these conditions it is not strange that those who have money, or who own notes or bonds will try to keep from paying taxes although it is a serious offense to fail to list all the property with the assessor.

It has been contended that under these unjust conditions that it was impossible to enforce the proper assessment of this invisible property, but it is only because our judges, prosecuting attorneys and assessors have not the moral courage to do their duty. Over in Ray County a few years ago the people elected a man to the position of Circuit Judge who considered it as much his duty to instruct the grand jury on tax dodging as to instruct them on "bootlegging." The result has been, according to the newspaper reports, that more than $5,000,000 of taxable wealth has been added to the tax lists of that district and there is no need of making special levies to have sufficient money for current needs.

But while one judge has shown that it is possible to enforce our tax laws reasonably well it remains a fact that tax dodging is the rule among the holders of intangible property. This ought to teach us that our present system of taxation is wrong and ought to be changed.

One of the first changes we think that ought to be made is to separate our collection of state and local taxation. A great deal of our state revenues is now collected from other sources than property taxes and we see no good reason why all our state taxes could not be produced without levying any property tax at all. A state income tax and a general inheritance tax such as several other states collect would provide all the money the state would need. This would leave the property tax entirely in the hands of the local community and if any district failed to enforce its tax laws it would not then work a hardship on any other district where the laws were enforced by conscientious officers.

FUTURE WHEAT PRICES

It is apparent to any one familiar with conditions that something other than legitimate supply and demand has been influencing the price of wheat for the last few weeks. True the Government forecast a month ago was for a crop in this country of about fifty million bushels more than last year, but what is fifty million bushels when compared to the world's wheat crop of nearly four billion bushels. If it should materialize it would only increase the world's crop a little more than one per cent, and then we are starting in with a less reserve held over than we had last year. No authentic information has been given out concerning the European wheat crop but it is evident that most of the warring countries cannot possibly produce their full normal crop by several million bushels. The conditions in several states since the June Government report was issued have been unfavorable, and it is quite probable that instead of this country producing more wheat than it did last year that it will produce considerably less. Kansas, the largest producer of winter wheat, will fall short forty or fifty million bushels from her record crop of 1914, Missouri will have a few million bushels less wheat than last year and Iowa and Nebraska will hardly come up to last year's average. There is plenty of time yet for frost or rust to cut the prospect down in the spring wheat country of the Northwest, and so taking the whole situation into consideration there is no valid reason that we can see for the big loss in the price of wheat.

The Missouri Farmer never assumes to advise its readers when to sell a crop for there are too many influences in control of market prices for any one to forecast the future. There is one thing quite certain, however, and that is, that a rush of wheat to market as soon as thrashed will help the manipulators keep the price down.

In order to hold wheat safely it ought to be well stacked and in this way it can be held for several months without loss or expense. After the wheat has dried out thoroughly in the stack it is easily kept in the granary without loss, but there is great danger of farmers storing wheat thrashed out of the shock. In the climate of Missouri there is very great danger of serious loss from weevil in wheat that is thrashed out of the shock.

We pointed out the conditions surrounding wheat prices last year and those of our readers who took advantage of the information made good money by it, and we see no reason why they should not do the same this year.

CONVICTS ON PUBLIC ROADS

For more than two years we have had a law in Missouri permitting the working of state convicts on the public roads but up to this time very little has been accomplished. Organized labor has forced a change in the old policy of the state to sell its prison labor to contractors and now the state authorities are up against a problem of finding something for the convicts to do that will earn the expense of their maintenance. In some of the Southern and Western states convicts have been worked in large numbers on public roads and the system seems to be satisfactory, but for some reason we are not making any headway with the plan in Missouri.

Under our Missouri law any county can have a number of convicts to work on the public roads just for paying the cost of guarding and feeding the prisoners which should not be more than one-half the cost of free labor. We certainly need the roads and the convicts need the out-door work, but if the people are opposed to having a camp of convicts in the neighborhood then some other employment must be found for them. This feeling against having the convicts in the neighborhood and the lack of sufficient interest in better roads in a great many counties must be the reason for not utilizing the convicts for road building. In discussing this subject the Kansas City Star in a recent editorial said:

"There isn't a single rock road across the state between Kansas City and St. Louis. There isn't a single highway from the Iowa line to the Arkansas line rocked all the way or even a quarter of the way.

"In the Missouri State Penitentiary there are between four hundred and six hundred convicts, outside all the kitchen and dining room help, who haven't a thing to do. They stay in their cells, the worst form of cruelty that could be devised, from meal time to meal time, except for occasional exercise periods. These four hundred to six hundred convicts, the number varying from time to time, are men above the number now used by the iniquitous contract system.

"The experimental convict road camp which has been established in Osage County, has proved, after three weeks of work, that the convicts are tickled to get a chance to work out in the open on such work as road work; that they do as much, or more, as the labor hired at $1.50 and $2 a day to do such work and that it costs the counties between seventy and seventy-five cents a day per man to feed and guard them.

"The board of prison inspectors could put those five hundred convicts, who are doing nothing, at work building a permanent highway across the state. It would be an act of humanity to the convicts and result in Missouri getting something concrete and definite done toward a great cross state highway.

"The prison board is made up of the state treasurer, the state auditor and the attorney general. Those gentlemen can do something worth while for Missouri and leave a monument to their administration. It is a great opportunity."

STARVE THE HESSIAN FLIES

The loss in the 1915 wheat crop from the ravages of the Hessian fly in some sections will be the greatest in several years. From late May or June to October, 1914, the department issued repeated warnings and advisory statements telling of the impending danger of a serious outbreak of the pest during the year 1915. It is now too late to do anything toward lessening the devastations of the Hessian fly in this year's crop. Now is the time, however, to begin the work of saving from the fly the millions of acres of wheat which will be planted on the present infested area within the next few months.

In order to understand the situation fully, it is necessary to know what the fly is like, how it is capable of causing such enormous losses, and how it transforms from the egg to the fully developed insect. Comparatively few farmers are able to recognize this pest, excepting in what is known as the "flaxseed" stage, which even then is often mistaken for the egg.

There are two generations of the Hessian fly each year, one in the fall and one in the following spring, the latter being the children of the former. Therefore, if there were no flies to lay eggs in the fall, it stands to reason that there could be none to lay eggs in spring.

In the course of its development the insect passes through four different stages. The adult is a small, long-legged, dark colored fly, very much resembling a small mosquito. The egg is very small, long, slender, and of a shining, reddish color, and is placed by the female fly in the grooves on the upper surface of the wheat leaves, both in spring and fall. The maggot hatches from the egg, makes its way down the leaf, and wedges itself between the leaf sheath and the stalk of the plant, where in some cases a dozen or more may be found partly overlapping one another. When it becomes full grown its skin hardens, changing to brown, and from its form and color it is then commonly known as the "flaxseed," which is the pupal or resting stage of the insect.

Beginning about April 1, flies emerge from the "flaxseed" that have passed the winter in the fall wheat, whether early sown or volunteer. These flies deposit their eggs on the leaves of the uninfested plants, the eggs hatch into maggots in from 4 to 8 days, and the maggots become grown in about 20 to 30 days and then change to "flaxseeds." This constitutes the spring generation. After harvest the "flaxseed" of this generation can be found in the stubble just above the ground, or often higher up where the straw has broken over.

While, as stated, the Hessian fly emerges from the "flaxseed" stage throughout an extended period of time within the entire area of its distribution, in any given locality this emergence of the adults in destructive abundance occupies but a few days. The life of the female after she makes her way forth from the "flaxseed," probably does not extend beyond a period of five or six days. Thus it is that a delay in wheat sowing in the fall until after the flies have appeared and largely disappeared becomes of such vital importance.

The first flies of the second or fall generation begin to issue from the "flaxseeds" about the middle of August and continue to issue till about the last of October, according to latitude, the maximum emergence occurring during the last two weeks of September or the first week in October, depending on the locality. This second generation infests volunteer wheat and all wheat sown before the fly-free date. The "flaxseeds" of the second generation remain on the plants of fall-sown wheat till April of the next year, when adults issue from them and begin another season.

No farmer need be in the least uncertain as to the extent to which his wheat is infested in the fall. An infested plant stands straight upward in the drill row, with broader leaves of a darker green color, does not tiller, and therefore does not spread out and cover the ground between the rows. The Hessian fly attacks wheat, rye, and barley, but not oats.

Nowhere, either in the East or West, should wheat be sown on wheat stubble if this course can possibly be avoided. However, in the East, as well as in some portions of Iowa and Missouri, the wheat stubble is universally seeded to timothy and clover, and therefore any kind of cultivation of these stubble fields is rendered impractical, though in many cases it would be far better to sacrifice all except the very best seeding. Neither can the fields be burned over without destroying the young seeding, and where these conditions prevail the only practical method that the farmer can use is that of delaying his wheat sowing until the flies have made their way from the stubble to the fields and died there without being able to find any plants upon which to deposit their eggs.

It should be borne in mind that the most practical and effective methods of controlling the Hessian fly are identical with the best methods of producing the maximum yields of wheat. It is entirely possible for the farmer to fight the Hessian fly by the process of good farming, involving thorough cultivation, good seed, and a rotation of crops. The most serious objection to the most practical and effective method that can be employed to control this pest in the field—namely, late sowing—is that there is danger of so delaying the growth of the plants that they do not become sufficiently advanced to enable them to withstand the winter.

Starve Out the Hessian Fly.

The Hessian fly, being in the "flaxseed" stage in wheat stubble and in unharvested wheat from June till September, or even October in the South, can be destroyed by carrying out the following methods of control:

1. Burn, where possible and safe, all stubble and ruined wheat.
2. Disk all stubble and ruined wheat immediately after harvest, where burning is impracticable.
3. Plow under deeply all stubble and ruined wheat fields before August 15, harrow the ground, and roll if necessary.
4. Harrow, disk, pasture, or otherwise effectually destroy all volunteer wheat.
5. As a measure preparatory to sowing, plow as early and deeply as existing conditions will permit; disk, harrow, and roll until a thoroughly pulverized, compact seed-bed is obtained.
6. Do not sow wheat until after fly-free date.
7. Rotate your crops if possible.

A FERTILIZER TRIAL

About September 10, 1914, I sowed a certain field to wheat. The whole of the field was prepared alike and put into good condition. After making considerable inquiry as to the proper quantity of seed to be sown to the acre I was in much doubt about the matter. I had also heard that more wheat could be raised on the same ground by drilling half the quantity of seed wanted on the ground and cross drilling the other half. This field, like most fields, had thin spots and more fertile ones. To make a test of the matters in doubt I drilled ⅞ bu. of seed to the acre with 75 lbs. of commercial fertilizer and then cross-drilled with the same amount of seed and fertilizer, but left a strip about ten feet wide through the middle of the field that was drilled and fertilized one way only. The field was pastured all winter, regardless of weather, until about April 1st, after which it was not pastured at all. Enough stock was kept on it to keep it eaten off rather closely during all the time that it was pastured. On June 9th, 1915, it was ready to harvest. I then went to the test strip with an iron hoop from the top of a coal oil barrel, let the hoop down among the wheat sown on a thin spot and drilled one way only, then gathered all the heads inside. I found that there were 59 heads and that they weighed 2 ounces and 6 drachms, using apothecaries weight because I had no other weights to use on so light a weight with sufficient accuracy. In the same manner within a foot of the same spot, all conditions being the same except that it had been double-drilled and fertilized as aforesaid I found 65 heads within the hoop that weighed exactly 3 ounces. I find that the heads from the thin sowing on the thin land weighs 91 and 2-3 % as much as the other. I estimate that the double sowing on this land will make 12 bu. to the acre, and if so where sown with half the seed, half the fertilizer and drilled one way only would make exactly 11 bu. per acre.

The same test made in the same manner where the land was strong and where the double sowing will probably make 20. bu. per acre showed 81 heads on the thin sowing weighing 4 ounces and 6 drachms while where it was cross drilled and double fertilized there were 93 heads but they weighed only 4 ounces and 5 drachms.

From the foregoing it would appear that on this land and this season the additional yield of wheat upon the thin land is far short of the additional expense while on the better land the yield was actually less than where only half the seed was sown and with only half the fertilizer. The quantity of fertilizer used where cross drilling was done was not excessive. On other land I used the same season even more with good results. J. B. Daniel.

Editorial Comment: We can draw no reasonable conclusions from the above trial by Mr. Daniel because there is not sufficient information to base an opinion upon. There is a great deal of difference in the quality of fertilizer on the market and whether this particular brand of fertilizer was suited to the need of this soil we can not tell. Then we do not consider one trial sufficient to prove anything. Then the uncertainty of accuracy of the hoop method of determining the yield might make a considerable difference.

WANT A GOOD FARM HAND?

In these days when one of the most puzzling problems that confronts thousands of farmers is a sufficient supply of farm help, a dependable gasoline engine is becoming more and more an every-day farm necessity—and we feel confident that if farmers generally realized what a great help a good all around engine can be—how many different things it can do and thus economize on time and energy, the sales of the past would be more than doubled in a short time.

To begin with, if the average farmer would make it a practice to grind more of his feed he would get a much greater value out of it for his live stock such as hogs, young colts, cows, calves, poultry, sheep, etc.—and we have reached a point where we must have the maximum results out of the things we feed and for which, during short crop years, Missouri farmers pay out millions of dollars. With a small gas engine and a feed grinder the task is rendered easy and simple.

But this is only one of the many uses of a gas engine. It will pump your water, saw your wood, run your ensilage cutter, cream separator, churn, washing machine, spraying outfit and anything else that requires power on the farm—thus saving lots of time, hard work and worry.

On the last page of this issue you will find the advertisement of the Witte Engine Co.—one of the most reliable concerns of this kind in the Country, and just as a matter of future information we would suggest that every reader of The Missouri Farmer drop them a postal card and ask for their literature—for it contains a lot of facts and shows you how you can do a lot of things which you are now doing by hand in one-fourth the time and at much less cost. Whether you want to buy an engine at this time or not makes no difference. Their literature contains a lot of information which will be valuable to you in any event—and worth the postal card many times over. When you write tell them you saw their advertisement in The Missouri Farmer.

The Missouri Farmer is offering a beautiful Piano to some bright farmer girl in every community in the state. Many girls are already at work and will soon have won this beautiful prize. We will award only one Piano to each community—so it will be a case of "first come first served." If you are interested, therefore, you had better write us today. We will appreciate it if every friend of the paper will bring this offer to the attention of some bright farmer girl in his or her community.

The Missouri Farmer offers bright country girls a choice between a beautiful Piano or a free round trip Railroad and Pullman ticket to the great Panama Exposition. One of these prizes will be offered in every community in the state. Read the ad on page 13 and then write us which prize you prefer.

Free Offer

EVERY CAR OWNER will appreciate this fine rubberized, waterproof Tube Bag. Send us your dealer's name and address and the make of tires you use and we will send one free. It will keep your Inner Tubes in prime condition.

Firestone

TIRES and TUBES

give you most miles per dollar because we give them most quality at the factory. The low prices are due to great volume production by the world's specialists in America's Largest Tire Plant. Any dealer will supply you.

THE FLIES' REVENGE

Ten little flies
All in a line;
One got a swat!
Then there were....

Nine little flies
Grimly sedate;
Licking their chops—
Swat! Then there were....

Eight little flies
Raising some more—
Swat! swat! Swat! swat!
Then there were ....

Four little flies
Colored green-blue;
Swat! swat! (Ain't it easy)
Then there were....

Two little flies
Dodged the civilian—
Early next day
There were a million!
—Buffalo News.

Swatting flies helps some, but not much. The best way to remove these carriers of typhoid and other diseases is to clean up their breeding places—piles of refuse about horse stables. Do it now, and enjoy a flyless summer.

CANNING OF FRUITS AND VEGETABLES

(Lessons for Boys and Girls Canning Clubs)

Vegetables and fruits should be canned so as to resemble the fresh condition as nearly as possible in order that they give the best results in the diet. Therefore use as little sugar, salt or other preservatives as possible in canning.

Proportions of Sugar to Be Used.—One-half cup of sugar to one quart for fruits of medium sweetness. Three-fourth cup of sugar to one quart for sour fruits. This will not be as sweet as people ordinarily like but it will retain its shape and color in the fruit. Too much sugar destroys the fresh condition of the fruit and it will not be as valuable as a food.

Proportions of Salt to Be Used for Vegetables.—One teaspoon of salt to one quart of vegetables.

Canning in a Syrup.—For some fruits, the larger ones especially, a thin syrup is to be preferred to packing fruit in sugar. A syrup may be made with equal parts of sugar and water. Heat it enough to dissolve the sugar, then as soon as the jars are filled with fruit the hot syrup is poured over and the lids are placed on loosely and the jars are sterilized as given under directions.

Sterilization of Jars.—The secret of successful canning is complete sterilization of food material and jars. Sterilization is destroying by heat, all living bacteria (very small invisable bodies) in the food material and in all parts of the can that will come in contact with the food, then sealing perfectly so no more bacteria may enter. Therefore, it is safer to sterilize the jars before the food material is packed into them. If they are carefully washed and placed in a pan of cold water on their side and allowed to come to the boiling point and boil for twenty or more minutes it will be sufficient to make them sterile. Be careful in taking jars from pan in which they have been boiled, to sterilize them, not to place finger tips in top of jar because it is possible to carry enough bacteria or germs on the finger tips to spoil the contents of the jar. Do not wipe out with cloth. Simply take out of water by grasping by the side and place ready to fill. If fruit and vegetables are to be put into them it should be done immediately.

Storage of Jars.—A place should be prepared for storing the jars after filling. A section of the cellar may be partitioned off and shelves built so that the fruit may be arranged in a systematic manner. If neatly labeled and in order it will save handling to find the jar desired. The store room should be clean and dry and preferably dark, as light has a chemical effect on some fruits and vegetables and destroys the color.

IMPROVED KITCHEN TOOLS

The Columbia Kitchen Tools are improved Kitchen Tools—time-savers, labor savers. Our $1.00 Combination (6 pieces) consisting of Egg-beater, Cream-whip, Potato-masher, Cake-turner, Mixing-spoon, Egg-boiler and server helps you get better results. Made of steel and heavily tinned. Fully guaranteed. Satisfaction or money back. Sent PREPAID upon receipt of $1.00

Preparation of Vegetables for Canning

Greens.—These vegetables are a great resource in cold weather when green vegetables are scarce. (Spinach, Swiss-chard, lambs quarter, dandelion, mustard or beet tops are best). They have little food value but are refreshing and have slightly laxative qualities which make them a valuable addition to the more substantial foods. They contain little starch and only a suggestion of sugar but are rich in mineral matter or ash.

To clean spinach, cut off the roots, break the leaves apart and drop them into a large pan of water. Rinse them well in this water and put them in a second pan of water. Continue washing until there is not a trace of sand on the bottom of the pan in which the vegetable was washed. If wilted, let stand in cold water until fresh and crisp. Swiss chard is much more easily prepared for canning than spinach, and if kept cut it will remain tender until August. The leaves are so much larger that it takes at least 20 leaves of spinach to equal one of chard, and the surface of the chard leaf does not hold sand and dirt as does the spinach leaf and thus it washes more easily and quickly. As a green the Swiss-chard is the most practical for use.

Packing in Sterilized Jars.—After greens have been cooked down until tender in an open kettle in order to shrink them, pack in jar tightly, add enough hot water to fill the jar full but this should be very little, because jar should be packed full of greens. To this add one teaspoonful of salt and place the lid on loosely without the rubber. Place in boiler on rack. Put enough water into steamer to come two-thirds up on the jar and boil for one hour for each of three days. On the third day of boiling, about fifteen minutes before time is up unscrew tops, put on rubbers and screw down tight and place back in steamer for fifteen minutes so as to seal rubbers. See also that jars are full of sterile water at last cooking. Do not place jars in cool draft when removed from boiler or they are liable to break.

Asparagus.—All vegetables must be young, tender and freshly gathered. To clean asparagus, cut off the woody part scrape the lower part of the stalks and wash well. Cut stalks into even lengths or into short pieces of uniform size. Pack in sterile jars if in whole stalks, with tips up, add one teaspoonful of salt for every quart of vegetable. Cover with cold water and screy on top lightly without rubber. Place in boiler and steam for three successive days, one hour each day. Place rubber on jar the third day about fifteen minutes before time is up. Carrots and parsnips may be canned in the same manner.

Rhubarb.—Because the growth of bacteria is checked by acid in fruits and vegetables, rhubarb and gooseberries containing such a large per cent, require no heat in order to keep. The washed rhubarb can simply be placed in the can and freshly boiled water poured over it and the jars sealed but there would be no advantage in canning rhubarb by this method. Why not prepare it so that it will save the preparation when taken from can? Place alternating layers of rhubarb and sugar in a can and steam for forty minutes in boiler. This is a good practical method.

Gooseberries.—Gooseberries may be prepared in the same manner as rhubarb.

Parsnips and Carrots.—Many people do not like parsnips and carrots because they do not know the difference between the small tender young ones and the large strongly flavored ones. The smaller ones may be canned in the spring time and they make a delicious winter vegetable. Or they may be planted late in the summer and if the season is good they will be about the right size to put away for winter without canning.

To Can Parsnips and Carrots.—Boil until skins can be taken off easily. Remove skins. Pack in jars whole or sliced, add boiling water and one teaspoon salt to each quart. Place in boiler and steam—one hour each day for three successive days. Placing rubber and screwing on lids tightly during last steaming.

Peas and beans are called legumes and are the vegetables which can be substituted for meat in the diet to a certain extent, because they contain much of the same tissue building or muscle making food material, called protein, that meat does. Thus they are valuable foods for use during the whole year. With these as with all vegetables they should be canned while they are tender and when freshly gathered.

Peas.—Select young tender well grown peas, shell, put into clean sack or wire basket and place in boiling water for five minutes. This shrinks the peas slightly and the hard yellow ones may be picked out. Pack firmly in sterile jars, fill with clear cold water, add 1 teaspoon of salt to each quart of water. Place lid on loosely and steam in boiler for one hour each day for three successive days. The lid is tightened between each steaming and then loosened again for each successive steaming. The sterile rubber is placed on jar during last steaming and lid tightened.

Lima Beans.—Carefully hull and can as quickly as possible after hulling. Pack in sterile jars and add clean water and one teaspoon salt for every quart. Steam as given under direction for peas.

BREAD MAKING.—No. III

(Continued from last issue)

Short Process or Straight Dough Bread Using Liquid Yeast.—It is called short process bread because it takes a shorter time to make it than the long process bread, when a sponge is set. This is sometimes called a "straight dough" bread.

Proportion for one loaf:
1 cup of liquid (½ cup scalded milk, ½ cup boiled water)
1 tablespoon of butter or lard
1 tablespoon of sugar
1 tablespoon of salt
¼ or ½ cup of liquid yeast or
¼ cake compressed yeast
3 to 4 cups of flour

Method.—To the shortening, sugar and salt in a bowl, add the scalded milk and hot water. Cool to lukewarm temperature and add yeast. Add flour to make a batter that can be beaten. Beat thoroughly to mix ingredients and to get air into the batter to make the yeast plants grow. Add the remainder of flour to make a stiff dough that can be kneaded. Knead on a board or in a bowl till the dough is quite smooth and elastic and bubbles appear under the surface. It usually takes about a half hour. Thorough kneading is necessary to scatter the little plants even throughout the bread; also to break up the gas bubbles so the bread will not have big holes on the inside, but small even holes. This is called the texture of the bread. Too much kneading will destroy the elastic quality of the gluten and spoil the flavor of the bread. Never knead over thirty minutes.

Place in a clean bowl and let rise until double its bulk. Then shape into loaves. Let rise again till doube in bulk and bake in oven from forty-five to sixty minutes.

Materials and Size of Bread Pans

A blue black shiney iron, called Russian iron, is considered about the best material for bread pans. Tin pans are also very good for bread baking, giving a crust which is satisfactory both in color and in texture. Granite and enamel pans are not so good because the loaf draws away from the sides and bottom making a concave surface. In aluminum pans the loaves do not brown as well on the sides and bottom. In order to get the same results with sheet iron and granite as with tin, the oven heat must be at a lower temperature.

Bread pans of a uniform size about four and one-half by three and one-half by nine inches for baking in single loaves are best for bread baking. This will insure a more thoroughly baked loaf and give a crust of the proper texture. When several loaves are baked side by side in a large pan it is very hard for the heat to reach the center of the middle loaves and the crust of those on the outside would almost have to burn before those in the center would be baked.

Graham Flour.—Graham flour is made by taking the whole wheat grain and grinding it up. In making the white flour much of the husk or covering of the wheat grain is removed but in the graham flour this is left in, so it is much coarser than the whole flour. It contains more mineral matter than the white flour because this food material is found next to the skin of the fruits and grains and when this is removed we remove this food. On the other hand there is a great deal of waste material in graham flour because there is so much woody fiber present in the husk of the grain that is not good as food. The cheaper grades of graham flour are often made by mixing an inferior grade of flour with bran.

Entire Wheat Flour or Whole Wheat Flour.—The very opposite of what its name would indicate, the whole wheat flour is not made by grinding the whole wheat grain; part of the bran coats are removed. It is also usually more finely ground than graham flour.

Graham Bread.—On account of the coarseness of the graham flour the bread is more light and a better quality when the graham flour is mixed with white flour for use. Half and half of each is a very good proportion for good results.

Proportion for one loaf:
1 cup of liquid
1 tablespoon of sugar
1 tablespoon of fat
1 teaspoon of salt
¼ cake of dry yeast or ¼ cake of compressed yeast or 1.4 cup of liquid yeast
3 to 4 cups of flour, ½ graham and ½ white flour

If dry yeast or liquid yeast is used make bread by long process or sponge method. If compressed yeast is used make by short process or straight dough method, as given in previous article.

Addie D. Root,
Agricultural Extension Service,
University of Missouri.

GET RID OF THE FLY

The United States Department of Agriculture has recently published the results of experiments to prevent the breeding of flies and states that the sprinkling of a small amount of borax in layers in manure will entirely prevent it.

The following are directions for the use of borax: For every eight bushels (or ten cubic feet) of manure sprinkle with a flour sifter or any fine sieve .62 pounds (slightly more than half a pound) of borax, particularly around the outer edges of the manure heap, and over this sprinkle with a watering can or otherwise two to three gallons of water. The borax coming into contact with the eggs prevents their hatching. Maggots gather at the outer edges of the pile. Consequently most of the borax should be applied there.

Experiments show that no injurious action on most crops will follow the application of manure so treated, but its cumulative effects have not been determined and its action on all crops has not been studied. It is recommended, therefore, that not more than fifteen tons per acre of such treated manure should be applied to a field.

Until the wished-for object of destruction of flies is accomplished, it is necessary to take precaution against spread of disease by flies. The two chief measures required for this are (1) **to disinfect the discharges,** especially those of patients suffering from intestinal diseases and (2) **to keep the house well screened.** In other words the fly must be prevented from feeding on discharges which may contain disease germs and secondly flies which may have so fed must be prevented from reaching people who are

well. Next to keeping the premises cleaned up, the most important thing both for people in the town and in the country is to keep the house well screened. This costs only a small amount and the saving in doctor's bills in a single summer will often pay many times over the small expense involved. In addition to this the comfort of being rid of the fly is worth many times the trouble and expense involved. The chief necessity is in so fitting the screens that no openings will be left for the flies to enter. In case some do get in they should be killed at once with a fly "swatter." It is especially important to kill all flies that appear early in the season. One fly killed in April means millions less in August.

The author visited one day last year in the State of Missouri a home in which one of the members of the family was very sick with typhoid fever. No precaution whatever had been taken to exclude the flies and they were swarming about the patient by hundreds. One person was kept continually busy fanning them away, and if for a moment the vigilance was relaxed, the flies settled down on the patient in a swarm. No prophet was needed to predict that other members of the family would be almost certain to be attacked by the same disease. The expenditure of a few dollars for screens would not only have contributed a great deal to the comfort of the patient but would have greatly aided in preventing the spread of the disease. The message, which above all others, this article ought to bring to country homes is **"screen your houses."**

The following extracts from a publication of the Indiana State Board of Health, give the history of the house fly by dates and make it easy to remember approximately how the different changes take place:

Journal of a Female House Fly

Thursday, November 2, 1911. Went into winter quarters.

April 20, 1912. Barely lived through the long, hard winter. Came out of winter quarters and laid my first batch of eggs—120 in number—in a manure heap.

April 21, 1912. My first 120 eggs have hatched.

April 22, 1912. Larvae have undergone first molt.

April 23, 1912. Larvae has undergone second molt.

April 26, 1912. Larvae transformed into pupae.

May 1, 1912. One hundred and twenty full grown flies, sixty of which are females.

May 3, 1912. Laid my second batch—120 eggs—this time in the filth of an uncared-for privy.

May 13, 1912. One hundred and twenty flies came from my second batch of eggs. Laid my third batch in a kind neighbor's garbage can.

May 20, 1912. The city has offered a prize to the school child who will kill the largest number of flies. The boy at the house where I live is killing flies right and left. And to think **—we have all been eating at the same table with him.**

May 21, 1912. Laid my fourth batch of eggs. Left alone and unhindered, by September 10, 1912, my descendants will number 5,598,720,000,000.

Fly Catechism

Where is the Fly born? In manure and filth.

Where does the Fly live? In all kinds of filth and he carries filth on his feet and wings.

Where does the Fly go when he leaves the manure pile, the privy vault and the spittoon? He goes into the kitchen, the dining room, and the store.

What does the Fly do there? He walks on the bread, fruit and vegetables. he wipes his feet on the butter and he bathes in the milk.

Does the Fly visit patients sick with consumption, typhoid fever and cholera infantum? He does and he may call on you next, carrying the infection of these diseases.

What diseases does the Fly carry? Typhoid fever, consumption, diarrheal diseases, diphtheria, scarlet fever, and in fact any communicable disease.

How can the Fly be prevented? By destroying all the filth about your premises; screen the privy vault; cover the manure bin; burn all waste matter; destroy your garbage; screen your house.

Either man must kill the fly or the fly will kill man. **Prevent the fly.**

M. P. Ravenel,
Professor of Bacteriology and Preventive Medicine, University of Missouri.

COOKING GREEN VEGETABLES

If we think of vegetables in terms of the 85 per cent to 95 per cent of water diluted with color, flavor and a small amount of solids, then the price of water masquerading as vegetables seems high.

But, if we think of the need for flavor and mineral matter to induce a better appetite and keep the body in good health the purchase of the vegetables, in season, will seem less costly than tonics from the drug store.

It is most important when preparing vegetables to save the portion which gives flavor and that which provides the mineral matter needed by the body. At least 20 per cent of all iron required by the body has its source in vegetables.

Experiments have shown that flavor and mineral matter are lost in less or greater measure when these vegetables are cooked in too much water which is later thrown away. It is best to use as little water as possible in boiling green vegetables and to keep this water to be used later in soups or sauces.

The loss of mineral matter from vegetables through boiling may be as high as 36 per cent in spinach, celery, cabbage, Brussels sprouts, cauliflower, carrots and not more than six per cent when these same vegetables are steamed.

Flavor, when its source is from a product which is readily given off in steaming, may be retained by cooking at temperatures below the boiling point. It is for this reason that peas, asparagus, celery, cucumbers, and carrots should be cooked at simmering temperature.

Strong flavor may be lessened by cooking rapidly in open vessels. This is true of cabbage, cauliflower, onion, and pepper. Cabbage may be "cooked" at the end of twenty minutes. Longer time develops strong flavor and, in hard water, may darken the color.

Those fresh green vegetables, which consist of leaves and stem, may be steamed; or may be cooked without added water if heat is applied slowly, causing the water in the leaves to escape in such amounts that the plant cooks in its own juices.

Delicately flavored vegetables, as peas, string beans, squash, and rutabagas, may be served in their own juices, seasoned only by salt, pepper, and butter. Brussels sprouts are improved in flavor if cooked in meat broth made as for soup stock, or in water flavored with boullion cube. Carrots, celery, cucumbers and summer squash may be improved in appearance and flavor by first cooking in water, then draining and covering with white sauce.

Abby L. Marlatt,
University of Wisconsin.

THE GROWTH OF THE FLOWERS

June is the crowning month of the year for beauty. Then all the plains are clothed in bright green and the barren hills glorious with blooms. It is the flowers that deck thee with an indescribable loveliness. Where flowers bloom Eden's beauty returns. The rough places are made beautiful. When the flowers fade and die the hills lose much of their charm and the valleys their loveliness. No wonder the children of men love the flowers and are sad at their departure. The flowers are the treasures carried by the race when it lost its first paradise, and in all its weary pilgrimage on earth they have never left him. They comfort him when he is said, they soothe him when he is sick, they add to his gldaness when he is happy. The flowers are always welcome. They have ever a carte blanche. They are never out of place, either at the open grave when there is weeping, or at weddings when there is rejoicing. Creatures so universal and so beloved must certainly have a message for us.

Christ standing in the presence of lilies matchless for beauty directed the attention of the multitudes to them. He was talking to many who were old before their time. Ugly lines were ploughed deep in their foreheads, care and discontent were spelt in their upturned faces. Some worried over children , others wondered what they would have to eat tomorrow. Some fretted whether they would have the recognition of the people higher up. Others were feverishly anxious over their investments. The Son of Man grieved in His heart to see so much useless and foolish worrying. Turning to the lilies that bloomed at His feet He called upon them to open their lips and speak comforting truths to these poor, toiling, worrying people. With one voice they cried out, "Behold us!. We toil not, neither do we spin and yet we are arrayed in robes more beautiful than Solomon in all his glory ever was. Behold how we grow into forms of matchless beauty without a thought of care."

We are invited to consider how flowers grow into such exquisite loveliness. How they develop such glossiness of leaf, delicacy of stem, splendor of tints and colorings. Hear the answer as it comes from millions upon millions of flowers:

"We grow to such perfections and into forms divinely fair because we never fret, or exhaust our forces in anxious thought. We trust the God who made us so lovely will be able to keep us in our present loveliness and add increasingly to our beauty. We do not grow pale in the face of the storm cloud. We do not worry over the sun. We do not grow anxious over the rain. We accept the present blessings with thanks, believing that on the morrow the same kind hand will provide for us. When night comes we retire to our rest, never doubting that the dews and rains and sunbeams will come in their rounds laden with timely gifts. Thus always trusting, always grateful for gifts however small, always hopeful for a greater tomorrow, we climb out of the dark earth and grow into forms of celestial beauty."

The flowers speak truly. Never in the wide world could the flowers grow marvelously fair if they fretted or worried. The life to come is serene. If ever we are to attain its blessedness we must take to ourselves its large spirit of cheer and serenity. Worry is an enemy to growth, physical and spiritual. It is not by taking anxious thought that the merry children add cubit unto cubit unto their physical stature. They run, they leap, they tumble, they climb, they play, they work, they sleep, and eat, never thinking as to their growth.

Again say all the flowers: "We grow beautiful by simply obeying the conditions of our flower life. We do not have to furnish the conditions of our growth. We do not have to run after the rain, or exhaust our energies to bring the golden sunshine to us, or worry ourselves to death for the refreshing dew. All these are given us freely. The rain pours upon us in showers. The sun gladdens us with its warm sunbeams. The dew deposits its rich treasures of the night upon us, the only thing we have to do is to open our chalices of gold and silver and receive in gratitude the treasures of the clouds, the showers of sunbeams that fall, and the dews that form in silver beads. We simply obey the laws and conditions of our lives. The thing required of us is that we be found in the pathway of the summer showers, the rays of the sun, and the mighty dews. This is our great work. Doing this with joy and prompt obedience the result is our harmonious growth and blooms that are fairer than ever were woven in the looms of time." After the self same manner must we, the children of our Heavenly Father, attain to that fullness of stature that is within our reach and bear that noble fruitage that is expected of us.

Rev. Philip Jamieson.

Early Operation Is Only Cancer Cure

To conquer cancer requires only 5 per cent of the energy required to conquer tuberculosis, according to figures given before the Ramsey County Medical Society by the executive secretary of the Minnesota Public Health Association. This is true because the treatment of cancer is so much simpler and acts so much more rapidly than the treatment for tuberculosis. Although deaths from cancer have increased 22 per cent since 1910 and are now almost three-fourths as frequent as deaths from tuberculosis, early operation would reduce the death rate by half and if resorted to in every case would save practically all.

The great cause of deaths from cancer is the neglect of the growth in its early stages. At the present time, the patient goes to the physician just about one year too late.

The Missouri Farmer would like to have letters from the women readers giving their experiences with labor-saving machinery. There are so many little inexpensive conveniences for the farm home but a great many homes are without them.

OUR NEED

The arts of peace demand more plowshares,
The old are obsolete.

Where are the cannon which in ages past
Have hurled their murderous bolts through quivering flesh,
As Nations, cursed like Cain, fought face to face?

Where are the flashing swords,
Which gruesome dripped his brothers' blood,
Ere they were wiped and sheathed?

Where all the vast artillery of war,
The tons of steel in ships which plow the seas;
A menace to the peace of all the lands?

Come, bring them all, the farms in every land
Require more steel for tools of every kind;
Our Nation's weal, our brothers everywhere
Demand that sword be wrought to useful share.

We need these boys, who 'foretime went to war,
To till our fields, that's what their lives are for;
Earth's had enough of fields where carrion lies,
The food for vultures from God's cloud dimmed skies.

Marshal their vast array, these thousands strong,
Turn this great host to peace through all the years,
The hours of war are short, the years of peace are long;
And stop the agonies of pain, the woe, and woman's tears.

—E. M. R., in Successful Farming.

Farm Management

D. H. Doane, University of Missouri

And this for comfort thou must know,
Times that are ill won't still be so;
Clouds will not ever pour down rain;
A sullen day will clear again.
—Herrick.

Your Wife's Cooking and Your Plowing

On the cover page of the Progressive Farmer for June 5, a very interesting and short article under the above heading appeared. It is worth repeating.

"What sort of a housekeeper would you call your wife if she were regularly to offer you bread from half-worked dough, with clods of flour and salt, raw and indigestible, all along through the bread? You'd certainly think she wasn't doing her duty as a housekeeper, wouldn't you?

"Well, she has just the same right to say you are not doing your duty as a farmer if you are preparing your land with like shiftlessness. There's not much more excuse for a good farmer's having unbroken, indigestible clods mixed with the good plant food in his fields every year than there is for a good housekeeper's having big, unbroken, indigestible lumps mixed with the properly prepared family food on her table. Good, complete, thorough-going harrowing, genuine pulverization, of the fields is just as necessary as good, complete, thorough-going kneading of the dough in the breadtray.

MORAL: Your part is to feed the crops. Your wife's part is to feed the family. Do your part as well as she does hers, and you'll prosper more and have less feed and food to buy."

The New Land Bank Act

This paper has so strongly supported any constructive legislation that will tend to assist the farmers in getting cheaper money that it might seem almost superfluous to attempt to add anything to what has so ably been said editorially and otherwise. However, the subject is one of so much importance and concerns each of us in such a vital way that it would seem hard to say too much upon this subject.

We know that the past few years have indicated that it was almost impossible for us to put any constructive laws on our statute books by means of amendments voted upon by the people. This is a shame, and a fact greatly to be regretted by all thinking voters; however, we have to face the facts. The next time we go to the polls we will have an opportunity to vote upon a bill which will make constitutional a land bank act which has for its main purpose the providing of cheap money to farmers. There is one thought that comes to me at this time. I do not believe for a moment but what the farmers will, as a rule, stand behind this measure and vote for it, particularly if it is the only amendment to be voted upon. The question is, is there not a probability of someone attempting to slip in some other amendment that the majority of voters will be against, thinking that in an effort to kill the objectionable amendment the good one will go with it. Such a thought is not wholly a dream, for we have to think back but to our last election and remember quite vividly that two or three joker amendments were slipped in at that time in order to defeat certain good amendments that were to be voted upon. Unquestionably, the sentiment in favor of this land bank act will carry. I believe it could be carried today if it could stand upon its own merits. Now each of us must ask ourselves the question, "Can I vote for that which I want and discard that which I do not want?" This is the question. Those of us who know that we can, cannot help but feel a certain duty in assisting those who have fears on that subject. Let us put our best efforts into the circulating of petitions for this non-political, non-sectarian bill, and then go to the polls and vote like thinking men.

Boys at the State Fair

I wonder how generally it is known that is it possible for two boys to go from every county in this state to the State Fair each year? The Fair Board has set aside a sum of money which pays all entrance fees and the entire expenses of the boys during fair week. The boys chosen to make this trip are generally selected through the State Board of Education by competitive examinations. I have lots of boy friends in the country who have never attempted to win this most desirable trip. Think it over, boys, and write to I. J. Walker, manager, Jefferosn City, Mo., for the new circular just published on the school. Be prepared so that you can be one of the 114 boys at the State Fair this coming year.

In addition to the two boys from every county, there will doubtless be some boys and girls taken from some of the Farm Adviser counties to do certain contest and demonstration work as illustrating what is being done in the counties mentioned. Only young folks who have made good at the particular line of work concerned will be eligible to the trips from the Farm Adviser counties. In a short time we hope to be able to make a general announcement showing the basis on which these boys and girls will be selected. Watch for this announcement and keep in touch with your Farm Adviser so that you may be one of those selected.

Last year three little girls for one of the Farm Adviser counties prepared and served a dinner for Governor Major and three other guests. The Governor kindly invited these little girls to spend a day and night with him at the Governor's mansion in Jefferson City. These things are worth while, young folks, and they are honors that are worth working for to the best of one's ability.

A Caution

A year ago Sudan grass was very scarce and expensive. At present it is more plentiful and less expensive. However, there is quite a good deal of advertising going on at present in reference to large quantities of Sudan grass seed available for planting, and according to the advertisement, after oats and wheat crops. This seed is supposed to come from Texas and in one advertisement we find the grower offering to purchase all the hay that the farmers will raise at $15 a ton, f. o. b. the farmer's loading point. I am not in a position to say that this advertisement is false, but here are a few facts. The price that he is charging for the seed is over double what realiable seed has been purchased for this year. This man is a Texas grower and unless Sudan grass be purchased from an absolutely reliable source in the south, great caution must be used on account of the almost identical resemblance of Sudan grass seed and Johnson grass seed. In fact, our experts here at the University in the seed testing laboratory do not pretend to be able to tell the difference between Sudan grass seed and Johnson grass seed. The particular advertiser mentioned claims that the yield will be from three to ten tons. Let us figure five tons to the acre. According to his statement he has enough seed for twenty thousand acres. This would make a hundred thousand tons of hay; at $15 a ton you can see that this gentleman would have to have a considerable capital to buy back the amount of hay his seed would raise, according to his own statement. It is well to proceed with the Sudan grass seed cautiously.

Gas Tractor Equal to Fifteen Horses

I think the gas tractor is all right. I have an Avery 20-35 and it will pull equal to fifteen big horses or mules. It will pull five 14-inch plowers 7 inches deep in dry hard "gumbo" and do it all day and all night if you will stay with it and you need only to stop to fill the oil and water tanks. It will pull a 28-48-inch separator and thrash from 700 to 1500 bushels of wheat per day. It will furnish power for the silage cutter, wood saw, road grader, harrows, binders, wagons or anything you may want to hitch it up with. It costs about $100 per horsepower.

I thrashed 2200 bushels of wheat in two days and used only 58 gallons of gasoline which cost 11 cents a gallon and 2½ gallons of gas engine oil at 27 cents a gallon or a total of $6.92 for the two days thrashing.

They should last a long time if well cared for. I had never started a gas engine until I got mine and after the help of an expert for only three days I got along all right. I do a lot of work with the engine but cannot get along altogether without mules.

F. A. Brown, Beaman, Mo.

TANKAGE FOR HOGS OUTDOES OIL MEAL

Tankage, as a supplement to corn rations for hogs, is more profitable than linseed oil meal at present prices, and for nearly all classes of hogs is a more valuable feed.

Recent tests at the Minnesota Experiment Station are of interest to every Minnesota hog raiser who does not have plenty of milk or buttermilk. R. C. Ashby, in charge of swine at the University Farm, gives the following results with hogs fattened for market last winter.

Of five lots of hogs fed from December 22, 1914, to February 24, 1915, three were fed on corn, shorts, and tankage, and one on corn, shorts and oil meal. The average ration for the tankage lots was:

Shelled corn	84.45	per cent
Tankage	7.47	" "
Shorts	7.37	" "

The average ration of the oil meal lot was:

Shelled corn	77.83	per cent
Shorts	8.20	" "
Oil meal	13.58	" "

The initial weight of the oil meal lot was 136.75 pounds; the final weight 211.70 pounds; the average daily gain 1.17 pounds; the number of pounds of grain for each 100 pounds of gain was 531.13; and the profit per bushel of grain 5.3 cents. The average initial weight of the three tankage lots was 138.83 pounds; final weight 228.17 pounds; the average daily gain 1.39 pounds; the number of pounds of grain for each 100 pounds of gain 482.16; and the profit per bushel of grain 12.5 cents. All feeds were paid for at the following prices: Corn 50 cents a bushel; shorts $26 a ton; oil meal $36 a ton, tankage $50 a ton.

From December 24 to March 23, Mr. Ashby had on feed five lots of fall pigs, each lot receiving somewhat different rations. Of these one lot was fed corn, shorts, and tankage, while a second lot was fed corn, shorts, and oil meal. The tankage fed lot made an average gain of 0.722 pound a day, and the oil meal lot 0.621 pound a day. The tankage fed lot made 100 pounds of gain for each 376 pounds of grain eaten, while the oil meal lot required 460 pounds of grain for each 100 pounds of gain. The feed cost of 100 pounds gain on the tankage lot was $4.32 and on the oil meal lot was $5.27.

Tankage is a product marketed by the packing houses and is obtained from animal carcasses—blood, meat scraps, etc. It contains 60 per cent of protein and from 15 to 17 per cent of mineral matter, while oil meal contains 31 to 33 per cent of protein and from 6 to 7 per cent of minerals. Mineral matter is used to build bone and frame, and protein is used to develop muscular tissue, blood, and vital organs. Tankage is rich in lime and phosphorus, two materials greatly needed by young hogs and brood sows.

A certain amount of oil meal is good, but a mixture of the two feeds is better. The man who can supply all his feeds at home is fortunate. He who must buy should secure those materials which serve his purpose best and give the largest return for their cost price.

The Missouri Farmer offers bright country girls a choice between a beautiful Piano or a free round trip Railroad and Pullman ticket to the great Panama Exposition. One of these prizes will be offered in every community in the state. Read the ad on page 13 and then write us which prize you prefer.

A FEW THINGS TO DO TO BETTER LIVESTOCK

1. Treat cows gently and avoid excitement.
2. Be regular in time of milking.
3. Keep stables clean, well-lighted and ventilated
4. Weigh the milk of each cow at milking time.
5. Get your neighbor to share with you in owning a Babcock Milk Tester, and test the product of each cow.
6. Discard the animals which have failed at the end of the year to pay for their keep.
7. Breed your cows to a pure-bred, registered dairy bull from a family having large and profitable production of butter fat.
8. Raise well the heifer calves from cows, which for one or more generations, have made large and profitable productions of milk and butter fat.
9. Breed heifers to drop their first calves at 24 to 30 months of age. Give cows 6 to 8 weeks' rest between lactation periods.
10. Join a dairy cattle breeders association. It will help you keep posted and in touch with the best and most modern ways of managing your dairy herd.—George C. Humphrey, College of Agriculture, University of Wisconsin.

I seek the opportunity of serving you and will cheerfully furnish any information desired about rates and service.
W. S. George, G. P. A., St. Louis, Mo.

The Missouri Farmer is offering a beautiful Piano to some bright farmer girl in every community in the state. Many girls are already at work and will soon have won this beautiful prize. We will award only one Piano to each community—so it will be a case of "first come first served." If you are interested, therefore, you had better write us today. We will appreciate it if every friend of the paper will bring this offer to the attention of some bright farmer girl in his or her community.

IN THE COUNTRY

I'd rather lay out here among the trees
With singing birds and bumblebees,
A-knowin' that I can do as I please,
Than to live what folks calls a life of ease,
Up thar in the city.

It's kinder lonesome, mebbe, you'll say,
A-livin' out here day after day
In this kinder easy, careless way,
But an hour out here's better'n a day
Up thar in the city.

As for that, just look at the flowers aroun'
A-peepin' their heads up all over the groun'
And the fruit a-bendin' the trees way down;
You don't find such things as these in town,
Or ruther, in the city.

As I said before, sech things as these,
The flowers, the birds and the bumblebees,
And a-livin' out here among the trees
Where you can take your ease and do as you please,
Makes it better'n the city.

—James Whitcomb Riley.

BETTER SETTLE IT!

Forgive and forget! It is better
To live on the quiet than scrap;
For while you are fighting about them
Life's apples may roll from your lap!
And the fellow who fights becomes lonely,
And nothing to pay him remains
When he loses his friend and finds only
A patch on his eye for his pains.

Forgive and forget! It's not funny
To glare at some fellow you meet,
And there's no lasting plesaure in having
A brawl as you walk down the street;
And the friends who would back you—forget them!
They are out for the fun of a row,
And they'll go with the winner! so set them
Down friends of the other man now.

Of course you could lick to a frazzle
The chap whom you think of with hate,
But to let the past go, and forget it,
Marks you as a winner with Fate!
It's better to live on the quiet—
To shake hands with friends as you go,
Than to make yourself boss of a riot,
And shake all the friends whom you know.

—Farm, Stock and Home.

BUCKSHOT BY THE PROFESSOR

About the only snakes that are left in the Country are those we think we see. Better take the pledge, Brother.

It seems to me it would save a lot of time and trouble if marriage licenses these days had a divorce blank attached in the beginning.

I see where they're using beer kegs to keep self-binders from miring down in the wheat fields over in Kansas. But after all, an empty beer keg isn't much account.

We used to say that there were a pile of fiddlers down in the warm place but they don't amount to a corporals guard compared to the generals and leaders down in Mexico.

The hoe may be an ancient instrument but it's just as good a cure for cockle burs and rag weeds today as it was when you and I were compelled to break our backs with it years ago.

I've got a scheme. Let's get about a thousand mules, fasten a machine gun on each one—then time the machine guns to go off, get a lot of green horse flies and chase the mules across the Mexican border. Don't you think it's brilliant?

If you don't get the flies they're apt to get you. Many a man, woman and child has been sent to an untimely grave by typhoid fever or some other disease that was introduced into their systems by the fly. So "swat 'em"—for they're as dangerous as rattlesnakes.

Stay in your corn field just as much as possible. If the corn get's too tall to work with a cultivator, get you some little single horse harrows and keep the top of the ground well stirred and pulverized. A lot of farmers who plowed their corn wet are going to permanently injure it if they don't stay in the field.

It's only been a few years ago since people wondered whether we would ever be able to fly—and even during the last year or two the life of the average aviator was only about 90 days. Now hundreds of air ships hover over the armies in Europe and it's much safer than being in the trenches. Believe me, Mike, we are living in an age that "goes some."

I see where 35,000 people fought for a chance to listen to William J. Bryan at Madison Square Garden in New York the other night—which only goes to show that, whether you like him or not, he is one of the truly remarkable men this Country has produced in recent years. Sometimes people will fight to listen to a man out of curiosity for a little while but when they keep it up year after year there's something to him besides just wind. So call old Nebraska Bill what you please, you've got to admit that he's one of the unusual men of his time.

Tractor for Plowing and Harrowing.

I will tell you what I know about the gas tractor for farm power. My outfit consists of an Average 40-80 tractor and 36-60 separator and an eight-bottom self-lift plow which cost me $2500, $1200 and $800 respectively. The tractor is all the company claims for it.

We only use the tractor for plowing and threshing. The cost of plowing is about 50 cents an acre. I can plow with the tractor when the ground is too hard to plow with team. Can easily plow two acres an hour. Were I going to buy another one I would get a 20-40 tractor and a five-bottom plow. This tractor would be light enough to use for harrowing and seeding. This tractor will work week in and week out without getting tired.

Any farmer who plows one hundred acres every fall should make a tractor pay for itself in a little while.

Walter Hobson,
Rosendale, Mo.

Free Barn Plans

If you contemplate building a barn this fall and will drop a postal card to the Southern Pine Association at 619-D Inter-State Bank Building, New Orleans, Louisiana, and ask them to send you their free barn plans they will be glad to do so. This book should be in the hands of every farmer even though he does not expect to build an entirely new barn because it will help him to rearrange his old one so it will be much more convenient. Better write for the free plans today and mention The Missouri Farmer.

A Free Trip to the

Great Panama Exposition

For Farmer Girls

THE MISSOURI FARMER wants to furnish a FREE round trip Railroad and Pullman ticket to the Great Panama Exposition to some bright farmer girl in every community in Missouri. Commemorating as it does the greatest engineering feat in history, it is the most interesting as well as beautiful Exposition ever held in the United States—and between Missouri and San Fransisco lies a "Wonderland" which baffles description. Think of riding across the Western Plains in a luxurious Pullman car—of the snow capped peaks in the Rocky Mountains and the "Fairyland" of California. Surely this is a trip of pleasure and interest which should appeal to every bright farmer girl in Missouri. Write at once for full particulars. We can accomodate only ONE girl in each community.

The Missouri Farmer

Columbia, Missouri

FLEAS IN HOUSE AND BARN

A correspondent from Barton County states that his place is over-run with fleas about the barn and in the house and they have become very annoying. Mr. Leonard Haseman of the University was requested to give a remedy and replies as follows: The common flea, which at times causes so much trouble in different parts of Missouri, seems to be the one which breeds so rapidly on cats and dogs, or more especially, where they are permitted to harbor. In some cases, however, they seem to breed largely in hog houses and similar places. The flea is quite similar to the fly, as regards its stages of development. The eggs are deposited usually around any dry rubbish and the small maggot-like larva of the flea feeds on waste products from animals and other filth. After becoming fulfed the pest transforms to the active, jumping flea and after that it feeds largely on the blood of different animals.

In a campaign against this pest, therefore, the first and most important thing to do is to thoroughly go over and clean out barns, hog houses and other places where the fleas are breeding. Clean out all dry rubbish and then thoroughly flood stables and other breeding places with water. This will kill the young stages and will help to drive out the adults. Along with this the liberal use of coal oil or stock dips will help further to rid the places of the young, as well as the adults. Your first effort may not be entirely effective and after about two weeks you may find it necessary to repeat the operation, but if you can prevent them from having dry, filthy places in which to breed you can soon prevent the increase of fleas and in time you can get rid of those that are alreday present.

In the home one cannot always apply the same treatments that he would use in the barns, but if cats and dogs are not allowed to harbor in the house or under houses the flea will not likely continue to breed in the home and by thoroughly driving out all that are present in the home and preventing others from getting back from the barn and other breeding places, in time one can get ride of them in the home. Carpets and other floor coverings should be taken out and thoroughly dusted and all floors carefully scrubbed with hot soap-suds, or in case of finished floors the light treatment of gasoline will serve the same purpose.

This is a pest which has troubled man for centuries and while it is one which is fairly easily controlled in the beginning, it is not an easy one to get rid of after it has become thoroughly established. Patience and persistance will eventually rid any place of the pest. L. Haseman.

Taking Pictures on the Farm

There ought to be a good kodak on every good Missouri farm. Farm papers are always "hard up" for good farm scenes, harvest field scenes and pictures of good live stock. The Missouri Farmer would be glad to print any good picture of this kind—but the trouble is we can't find them. Then there are other pictures such as family groups and "The Baby" which will be of loving interest in the years to come when time with its ruthless hand has forever changed the things that were. We know of no more delightful or instructive pastime in which any bright farmer girl can indulge than to learn to take kodak pictures.

$150 PER MONTH and EXPENSES Salary or Commission—Introducing our King Butter Separator. Produces best grade of butter from cream or milk, sweet or sour, in less than 5 minutes. Retails $5 up. Write for free sample and salary proposition. **De King Mfg. Co., Dept. 98-H, Chicago, Ill.**

Elsewhere in this issue you will find the advertisement of the Eastman Kodak Co., and we suggest that you write them for prices on kodaks and full information about how to take pictures. Be sure to mention The Missouri Farmer.

Rhode Island Red Breeders, Attention!

The Missouri State Poultry Association has secured the services of Judge W. H. Card, Secretary of the Rhode Island Red Club of America, to place the awards on all Rhode Island Red classes at its twenty-third annual poultry show which will be held at Joplin, Mo., December 7 to 11, 1915.

In anticipation of very large classes, the Association has offered in addition to the regular cash prizes, $50 in special prizes on all classes totaling 200 birds.

Judge Card will be at the show during the entire week and will be glad to give personal attention to all requests for information to mating and scoring the Reds. He also will give a number of his chalk talks in the lecture hall.

All of the other breeds will be judged by equally well known judges of national reputation.

Through the co-operation of the Commercial Club of Joplin which has guaranteed a building suitable for cooping 5,000 birds, and also a portion of the operating expenses, the coming Missouri State Poultry Show will not charge admission to the show room or to any of the lectures or demonstrations. Fred Crosby, Secretary
Missouri State Poultry Association.

LIVE STOCK NOTES

G. B. Gurthet, Pattonsburg, Mo., Oct. 29.

A Notable Holstein Sale

What is perhaps the most notable sale of registered Holsteins ever made in Missouri was recently consumated when W. F. Phelps of Aurora, Mo., purchased fifteen head of cows and one bull from the Woodcrest herd owned by S. W. Cooke & Sons, Maysville, Mo., at an average price of over $400 per head. Mr. Phelps is establishing a very high class herd, and by his recent purchase his herd at once takes a place in the front rank of Missouri Holsteins. Included in the lot were some of the very choicest high producing cows that ever left the Cooke herd, and all, except two, are cows with A. R. O. records. These cows are all bred to the young Woodcrest herd bull, Prince Segis Walker Pietertje 123955, one of the strongest bred bulls of the breed.

Mr. Phelps was very fortunate in securing the grandson of Pontiac Korndyke to head his herd.

Mr. Phelps is to be congratulated upon securing such a valuable collection of breeding stock and the dairy interests of South Missouri will be greatly stimulated because of his enterprise.

Lockridge's Polands

Will G. Lockridge is now ready to ship spring boars and gilts sired by his great young boar, The Giant, one of the largest boars of his age that the writer has seen in the state.

Angus Bargains

J. D. Blackwell, Fayette, Mo., is offering a nice lot of young cows with calves at foot, heifers due to calve this fall, and several toppy young bulls.

Oakwood Polands and Shorthorns

H. S. Williamson is offering the readers of this paper a splendid opportunity to buy choice Poland China spring boars and gilts of strictly big type breeding, at very reasonable prices. Mr. Williamson also has on hand a number of good useful young Shorthorn bulls, of straight Scotch breeding, that should be in the hands of Missouri farmers who are endeavoring to build up a profitable herd of cattle. Mr. Williamson guarantees satisfaction.

Woodcrest Holsteins

We take pleasure in referring our readers to the advertisement of S. W. Cooke & Sons, Maysville, Mo., in which they call attention to their well known Woodcrest herd of Holsteins.

This herd is easily among the best in the Middle West, and has been selected and bred up for heavy long distance milkers. At the head of the herd stands the young bull, Prince Segis Walker Pietertje 123955. This bull was purchased from the Emblagaard Dairy, Big Bay, Mich. The records of his dam and granddam and the ten nearest dams of his sire average 29.76 lbs. butter in 7 days. Of these twelve, seven are 30-lb. cows; two are over 29 lbs.; one over 28 lbs., and one 27.85 lbs. The dam of his sire, Segis Walker Pietertje (butter, 7 days, 27.85 lbs., test 4.73 per cent, at 3 years of age) and her four dams, going back to the great cow Prillys, dam of Beauty Pietertje, hold the world's record for four and five generations. The records show that only three other families have produced a 30-lb. cow that has produced a 30-lb. daughter and a 30-lb. granddaughter.

At present Messrs. Cooke are almost sold out of mature cows, owing to the sale of fifteen head to W. F. Phelps, Aurora, Mo., but they have a choice lot of young heifers either bred or open, and eight exceptionally good young bulls, that they are offering for sale. The herd has been regularly tested twice a year for the past eight years for tuberculosis and as yet there has never been a reaction.

We recommend this herd very highly to any of our readers who are in the market for choice stock. In writing please mention The Missouri Farmer.

Thomson Bros. Durocs

Last week the writer visited the herd of Durocs owned by W. H. and Geo. E. Thomson, Columbia, Mo., and was gratified to see the class of young stuff that will soon be ready to ship. The litter out of Miss Crimson Col. I Am is among the top litters of the year and justifies the judgment of Messrs. Thomson in adding this remarkably good sow to their herd. The spring pigs by Col. Wonder II, the prize winning son of Col. Wonder, are very attractive, and are the kind that will meet with ready appreciation from our readers who are looking for Durocs with size, stretch, bone and quality. Several litters by the good son of Beauty's Model Top, Beauty's Col., out of some of the best sows in the herd, furnish choice material to select from. Messrs. Thomson are determined to own a herd of the best, and even now their herd will compare with any of the better herds of the state. They have built up a large and growing business by selling their Durocs on an absolute guarantee of satisfaction and we urge our readers to visit this herd before making their purchases.

Bruns' Jerseys

Wm. H. Bruns & Son, Concordia, Mo., are in excellent shape to furnish our readers with Jersey cows and heifers or young bulls. Theirs is a working herd and is making good for Messrs. Bruns. Young stock from such a herd will make good for the purchaser.

Duroc Boars and Gilts

R. L. Hill, proprietor of Adenhill Farm, Columbia, Mo., reports the following recent sales: One boar by Col. Wonder II to W. H. Jackson, Blackfoot, Idaho; one boar by Col. Wonder II and out of the prize winning sow, Missouri Lady Again, to Ray A. Niel, Aldrich, Mo.; one boar by Col. Wonder II, out of a Beauty's Model Top dam, to M. P. Mattingly, Owensboro, Ky., and one boar by Crimson Commander, out of a Defender dam, to Geo. E. Shedd, Anabel. Four gilts, three bred to Col. Wonder II and one to Rexall Col., to W. B. Matthewson, Yellville, Ark. Mr. Hill also states that the Shorthorn calf he recently advertised was sold to Geo. H. Kyd, Green Ridge, Mo.

Mr. Hill is meeting with marked success as a breeder and at present he has a very desirable lot of spring pigs coming

A high producing cow in S. W. Cooke & Son's herd

DUROC JERSEYS

Select Col. II--Crimson Col. I Am

I can furnish spring pigs, fall yearlin gs and tried sows. Bred the way the winner's are. Priced reasonable. Come and see my herd.

A. WHITE, JR. Box 422 PALMYRA, MO.

ADENHILL DUROCS--SPRING PIGS

Spring pigs sired by Col. Wonder II out of sows carrying as good blood as the breed affords. Get my prices before you buy.

R. L. HILL - - - - - - - Adenhill Farm, Columbia, Missouri

THOMSON BROS. DUROC JERSEY'S

Big bone, spotted pigs now ready to ship —$25 single pig, $45 pair, $65 trio. Pairs and trios no relation. Also registry furnished. Send check with first letter.

EDGAR DOOLEY, ETTERVILLE, MO

CHESTER WHITES

RAUSCHER'S CHESTER WHITES!

One of the Oldest Herds in the West

A few choice spring gilts bred for early farrow. Several richly bred big spring boars. A fine lot of fall pigs. Size, quality, and bone. Prices reasonable and every pig guaranteed.

H. Rauscher & Son, Kahoka, Mo.

Maple Grove O. I. C's

Over 100 spring pigs from 2 to 3 month old at the following prices: Choice of litter, $12; litter average, $10; fall gilts, $1 Bred gilts $20 to $25. Bred sows, $30 to $3 Prize winning blood and the most popula strains. Each individual guaranteed t give satisfaction.

F. J. GREINER, BILLINGS, MO.

on that he is pricing very reasonable. Most of them are sired by Col. Wonder II, the prize winning son of the champion, Col. Wonder, and by Crimson Commander.

These pigs have been handled carefully and have plenty of size, stretch and bone. Among the lot are several good herd boar prospects, but Mr. Hill is pricing them all so that the man with grade sows can afford to buy one of these pure bred boars. In writing please mention The Missouri Farmer.

Moore's Holsteins

Last week our representative visited the herd of Holsteins owned by M. E. Moore & Co., Cameron, Mo. This is the oldest herd owned in Missouri and for years has been drawn upon by discriminating buyers in search of breeding stock of proven merit.

The herd was founded by the late M. E. Moore, and at his death passed into the ownership of his widow and son-in-law. Mrs. Moore has decided to retire from active management of the herd and because of this fact it has been found necessary to reduce the herd to a considerable extent. Accordingly, it is announced that for the next ninety days, or until a sufficient number are sold, very special prices will be made on any individuals in the herd. Buyers have the whole herd to select from and will find most anything wanted. Aged cows, young cows, heifers, open or bred, or bull and heifer calves are in offer at prices quite below what is usually asked.

We feel sure that our readers will make no mistake in visiting this herd as soon as possible, and we gladly call this opportunity to the attention of those interested. It is not often that such a herd is offered for sale without restrictions. Mention The Missouri Farmer.

Remember September 8.

Any of our readers who are interested in Poland Chinas will find that they will be serving their own interest if they draw a ring around Wednesday, September 8. This is the date claimed by J. F. Richards & Son, Bevier, Mo., for their annual sale.

The Pen-Yr-Hyl (which by the way is Welsh meaning on top of the hill) herd is unquestionably one of the best collections of big type Polands to be found anywhere. The offering this fall will be thoroughly high class in every respect and buyers in search of breeding stock of merit will not be disappointed. Don't forget the date, and watch these columns for details later.

Missouri State Fair to Have Seven Day Butter Contest This Fall.

One of the interesting features of the Missouri State Fair at Sedalia, September 25 to October 2, will be the 7-day butter contest to be put on under the direction of State Dairy Commissioner E. G. Bennett, who for the South Missouri Dairymen's Association is offering a $500 purse in this contest.

All that is necessary to enter the contest, open for any and all breeds, is for the exhibitor to secure from his creamery man a certificate that he is selling milk products to that dairy from the animals exhibited.

This should be one of the very best and most attractive features of the animal husbandry department at the State Fair this fall. Dairy Commissioner Bennett hopes to be able to announce soon a series of purses from the Jersey Cattle Breders' Association as well as valuable special prizes from the dairy supply dealers. These prizes are virtually secured and will add a great deal of interest to the contests in the dairy classes in the coming big exposition at Sedalia as they will be among the most attractive given at any state fair this fall.

County Collections Brought Together

The Missouri State Fair Board is again giving liberal premiums for county exhibits at the Missouri State Fair and every inducement is being held out to have the county exhibit feature one of the strong cards of the fair at Sedalia, September 25 to October 2. The prospects for farm and garden products this year are such that it is advisable for those having exceptional specimens to begin to lay them by for the big State Fair this fall. County exhibits this year will be featured up at the fair in a way not heretofore attempted although these exhibits have been encouraged from year to year.

Rauscher's Chester Whites

H. Rauscher & Son, Kahoka, Mo., are offering an attractive lot of Chester White spring boars and gilts from their well known herd. Messrs. Rauscher have maintained a select herd for over thirty years and buyers will get the benefit of these years of experience. Our readers can bank on anything this firm offers.

Carr's Jersey Bulls and Heifers

Ezra E. Carr, Clayton, Mo., is offering ten Jersey heifers that are grand-daughters of the great bull, Noble of Oaklands. These heifers range in age from 3 to 20 months. Two young bulls of the same breeding are also for sale.

Mr. Carr writes that he is pricing this young stuff quite below the usual run of prices, because he is crowded for room. Mention this paper in writing.

Maple Grove O. I. C's

F. J. Greiner, Billings, Mo., is advertising O. I. C. spring pigs at prices that any of our readers can well afford to pay. The Maple Grove herd is one of the best in South Missouri and includes a number of prize winning sires and dams. Write Mr. Greiner for prices and mention this paper.

MISSOURI COUNTY FAIRS FOR 1915

Reliable Silo-Filling Power Costs Less NOW

MY FREE BOOK TELLS WHY

Road Portables in this style, either Gasoline or Kerosene engines, sizes, 6, 8, 12, 16 and 22 H-P.

Proof of Engine Quality Given by WITTE Users

Our 16 H-P. WITTE portable engine is giving satisfactory service. We are using it for threshing and filling silos.—**Chas. H. Clarke, 517 Third St., Des Moines, Iowa.**

Men who thought they knew told me my 6 H-P. WITTE engine wouldn't run it, but I got an Ohio cutter and blower, and cut four tons per hour. The engine is all I can ask.—**Charles O'Neal, Marshall, Ark.**

My 12 H-P. WITTE engine is operating a No. 12 cutter, 34-ft. carrier, and cuts five to six tons of silage per hour in good shape.—**J. A. Gould, East Hampton, New York.**

My 12 H-P. WITTE engine has filled eight silos. Can fill a 12x30 ft. silo in seven hours. Am using a 16-inch cutter.—**A. P. Peterson, Almena, Wisc.**

My 8 H-P. WITTE kerosene engine did fine work filling two silos. If I buy another it will be a WITTE.—**G. F. Kremer, Elsie, Mich.**

The 12 H-P. WITTE engine on my farm has been used for many purposes, and at all times has given the best of satisfaction. Find by comparison with others its cost of operation is considerably less.—**John M. Egan, Pres. Metropolitan Street Railway Co., Kansas City, Mo.**

I had not had any experience when I bought the 22 H-P. WITTE engine, and am highly pleased. If I buy another, it will be a WITTE.—**James A. Lowe, Erie, Kans.**

I am a good friend of the WITTE engine, having used a 22 H-P. for nearly seven years.—**Jas. R. Plumb, R. F. D. No. 1, Emporia, Kans.**

The 22 H-P. WITTE engine which I bought about two years ago is working satisfactorily, and has not given me any trouble.—**H. M. Basford, Hillsboro, Ore.**

During the 12 years, my 12 H-P. WITTE engine has cost me practically nothing for repairs. I run a 16-inch ensilage cutter and cut a wagon-load of green corn in ¾-inch lengths and lift it into the silo in 12 minutes. I still believe that no engine is better.—**John A. Reynolds, Winchester, Kans.**

I filled three silos in 72 working hours with my 6 H-P. WITTE engine. Used a No. 19 Hocking Valley cutter, blower type, with 12-inch knife.—**C. V. Chase, Thompson, Conn.**

My 6 H-P. WITTE engine certainly does its work in great shape. It takes just one-half as much gasoline as the —— make engine which my partner is using.—**M. Steinback, Heartwell, Nebr.**

Our 12 H-P. WITTE engine is running in this high altitude, and I am entirely satisfied with it.—**W. J. Elliott, Webb, Ariz.**

Four years ago I bought my 16 H-P. WITTE engine. I had never had any experience and lived 30 miles from town, but in four years have not had any repairs or trouble.—**Andrew Garcia, Cry, Mont.**

And thousands of other reports of similar character.

WITTE ENGINES

Gasoline, Kerosene, Distillate and Gas

SILO filling requires steady power—fast and heavy work through the whole day. Ripening crops do not wait—they must be efficiently handled in their proper time. And the lower the power-cost of handling, the cheaper is the cost of the silage.

For many years WITTE engines have proved their reliability for steady and continuous running, and easy handling of load up to rated capacities. All sizes are easy to start, without cranking. With my low prices and the fuel-saving, and wear-resisting qualities of WITTE engines, you get your power-cost at the bottom-most notch possible with a general-purpose, liquid-fuel engine. Let me send you what hundreds and hundreds of my customers say in proof of this statement. I want you to know that this is no empty claim. It is a fact of first importance to you as well as to me.

Stationary Engines for less than $17.50 Per H-P. Why Pay More

Sold only Direct from Factory, or from Pittsburgh, Pa., Warehouse. Prompt Shipments. Cash or Easy Terms. 5-Year Guaranty.

For 28 years—longer than any other present manufacturer of liquid-fuel engines—I have been making engines—doing nothing else. You will find my engines at all kinds of work, in all parts of this country and in many foreign countries. Everywhere they are used you will find WITTE boosters. I give my old customers the credit for building up my factory from nothing, until now it is one of the largest in the country—when I am the only man in the business who started, or was running, when I started. I couldn't have had my many thousands of boosters without shipping them engines worth their boosting.

Before you buy your new engine, I ask the privilege of showing you all about the WITTE. The space in this advertisement does not permit the many pictures necessary to show the construction of all parts and their operation, each in relation to the others, as my 28 years' experience has taught me how to build them for better quality. I don't want you to judge my engines alone from my low prices, or from the limited information I can give you here. My new book shows everything—my big factory with free power from my own natural gas well—the mass of newest type machinery needed for low-cost manufacturing—and details of my engine construction.

Stationary Kerosene engine on iron sub-base Sizes, 2, 3, 4, 6, 8, 12, 16 and 22 H-P. Also furnished on skids as shown below. Besides Kerosene and Distillate, this engine burns Gasoline and Naptha without any changes in equipment.

Stationary Gasoline engine on iron sub-base. Sizes, 2, 3, 4, 6, 8, 12, 16 and 22 H-P. Also furnished on skids as shown below. All stationary engines, like the portables, are completely equipped ready to run, for prices quoted.

Stationary Gasoline engine on heavy wood skids. Sizes, 2, 3, 4, 6, 8, 12, 16 and 22 H-P. This is the regular mounting for prices above quoted. Iron sub-base is small cost extra, shipped only on special order.

AND THE MISSOURI EXPERIMENTAL STATION

The War Craze

At this moment we are engaged in writing the reddest page of human history the World has ever known—and that is saying a great deal for there are big splotches of crimson that reach back as far as the recorded scribblings of the historian and beyond that they lose themselves in the gray mist of the first dawn. It is redder and more horrifying than any other epoch civilization has ever known because the mightiest nations on Earth are the gladiators in the present conflict—because millions are flying at each others throats instead of some few hundred thousand and because the very genius of our time enables us to slaughter whole regiments today where we only slaughtered companies in the bloody combats of the past.

Furthermore, we are writing not merely the reddest page in history but also the most shameful and foolish one—and the day will come when all Europe will realize this fact and when the stupendous folly of the performance will smite with the power of a thunderbolt those who still have some degree of reason left. But apparently this hour is still a ways off. Corps after corps of new men are being gotten ready for the slaughter and with each passing day the red furies of the trenches do an ever increasing business.

In the meantime, the war spirit has reached into every sphere and clime and even as these lines are being written the mania is gradually spreading through and over our own beloved Country and scores of great newspapers as well as men prominent in the public life of the Nation are demanding in stentorian tones a Navy and Army capable of holding their own against any other martial power in the World—and this humble publication takes this opportunity to dissent from the new propaganda.

Mind you, we are not opposed to a reasonable degree of National preparedness—but we do protest against the new spirit which seeks to convert this peace loving land into an armed camp in the years to come. Where is the lurking enemy for whom we should thus prepare? Surely it is neither England, Germany, France or Russia whose appetites for war will be well sated at the end of the present conflict and with whom we have no territorial quarrels? Surely it cannot be against the weak republics of South America from whom we ask nothing more than commercial friendship? Surely it cannot be poor famished and war ridden Mexico whom our regulars could subdue within ninety days? Or can it be Japan—that imaginary ogre of the East which has been disturbing our dreams here of late? That our Philippine entanglements have put a more serious phase upon such a controversy, should it come to pass, is undoubtedly true—but, in the end there could be but one outcome should the Mikado ever seek to challenge American manhood and American resources. But, assuming that there is a remote possibility of trouble with Japan, should this mighty Nation be converted into a veritable war camp for years to come merely because there is one sinister cloud on the horizon of the future?

Aided by our splendid geographical isolation, there is no power on Earth which could finally prevail against us and while we heartily favor powerful coast defenses and a Navy which can compel respect for our flag upon the high seas, we protest against a mania which assumes that the chief business of humanity from this time forward will be to destroy and kill. On the contrary, unless we are much mistaken, the World is on the threshold of more certain peace than it has ever known before—once Europe awakes from the pitiful and hopeless folly in which she is now engaged and which a hundred years of thrift and toil will not be able to wipe out.

The future conquests of this Nation should be won upon the farm, in the factory, laboratory and school room. Here lies the true path of our destiny and in this forum brains rather than brute force is the master.

TWENTY YEARS WITH FERTILIZERS

Ohio Circular 144, covering twenty years' experiments with fertilizers, is a most interesting and valuable contribution to agriculture. Director Thorne conceived the idea of conducting a series of experiments in five-year rotations for a period of twenty years on the same land, beginning with corn, followed with oats, wheat, clover and timothy, in order named. Thus four crops of each kind were harvested in rotation in the twenty years, excepting one year when the timothy failed.

In one set complete fertilizers alone were used; that is, fertilizers containing available phosphorus, nitrogen and potash. In other sets phosphorus was used alone and potash alone and phosphorus and potash combined. There were check plats where no fertilizer or manure of any kind was used. In each case with fertilizers, **the complete, available mixtures gave the largest crop yields.** The following table shows the increase where complete fertilizers were used alone, over plats where nothing was used:

	Corn	Oats	Wheat	Clover	Tim'thy
	4 crops	4 crops	4 crops	4 crops	3 crops
Complete fertilizer .....Av.	46.5 bu.	47.1 bu.	24. bu.	1.5 tons	1.7 tons
Check Plats, nothing used .....Av.	28.9 bu.	30. bu.	10.6 bu.	.9 tons	1.3 tons
Increase by use of fertilizers .....Av.	17.6 bu.	17.1 bu.	13.4 bu.	.6 tons	.4 tons
Percentage of increase by the use of feritlizers (E.& O.E.)	60%	57%	126%	66%	30%

The above results are very gratifying, but we think they would have been still more gratifying and far more profitable in dollars and cents if Dr. Thorne had used what we regard as better balanced mixtures: that is, more available phosphoric acid and less nitrogen and potash. In one set Dr. Thorne used twice as much nitrogen as he did available phosphoric acid and in another set three times as much. We would have reversed it. One of the most successful formulas for growing corn in the East, when used alone (based on forty years of commercial experience) is one where the ratio is approximately 3 nitrogen, 10 available phosphoric acid, and 7 potash, also carrying more organic nitrogen and less chemical nitrogen than Dr. Thorne used. Another formula used chiefly for starting crops and improving quality on a good soil or where manure or a green crop is plowed in, is a 2-8-2 mixture.

These Ohio experiments confirm our experience of forty-two years in selling fertilizers all over this country for all sorts of crops and conditions; that **complete, available** fertilizers produce almost invariably the largest crop yields. These experiments, as well as others all over the world, also show that complete fertilizers are not "patent soil medicines" or "soil stimulants" as claimed by Illinois officials, but if properly used are really and truly **soil builders** as well as crop producers.

Profits

It has been said that if the Ohio station had paid the price charged at retail for nitrogen, phosphorus and potash in ready mixed fertilizers, the experiments would have put the profits on the other side of the ledger. As to the profits in dollars and cents, that, it seems to me is, and always must be, a matter dependent on local conditions,—local conditions as to the cost of plant food, and local conditions as to market value of crops raised. To illustrate: If the fertilizer had been given to the potato growers of Aroostock County, Me., the past year, the price of potatoes (40c a barrel in the winter) would not have paid for the cost of seed, cultivation and use of land. On the contrary, if the price had averaged $1.25 per barrel (the normal average) a satisfactory profit would have resulted. The prices which were used in the Ohio calculations were extremely low—corn at 40c a bushel as against an average wholesale price of 48c in Chicago (today's price 75c); wheat at 80c as against an average of 95c (today's price $1.18); oats at 30c as against an average of 34c (today's price 48c). Therefor I do not think it altogether fair to draw conclusions which may be accepted as applicable to the whole country or even to Ohio, especially if based on low or unusual market conditions or on unbalanced formulas.

The Utilization of By-Products

It has been claimed that the materials used in the Ohio experiments were **more effective** than those used in ready mixed fertilizers. It is a well known fact, however, that factory mixed goods as a rule contain some if not all of the materials used in the Ohio experiments. In addition they contain by-product materials which are rendered highly available by the new process of manufacture and thus they are utilized to the advantage of the whole country, by keeping down the price of those things which may be used separately. Also, incidentally, they are **home products,** and keep at home money which otherwise would be sent abroad for plant food. There were millions of pounds utilized in Ohio last year, not including the nitrogen from Ohio coal, in the shape of sulphate of ammonia, which Hall regards as one of the best sources of nitrogen for all crops, and the best source for potatoes. For proof of their availability see Bureau or Soils Bulletin 158, entitled "The Nitrogen of Processed Fertilizers"; also consult the directors and chemists of the Eastern Experiment Stations.

The several million tons of complete fertilizers sold annually in this country could not be made on the Station's simple formulas of acid phosphate, nitrate of soda, dried blood, sulphate of ammonia, seed meals, and muriate of potash, for several reasons; but chiefly because it would boost the price of some of these materials out of sight. Because commercial fertilizers are composed largely of waste and by-products is the reason why the particular materials used were kept down in price, particularly the cost of nitrogen. The fertilizer industry must be given the credit of gathering all sorts and conditions of plant food from all over the world and rendering it available for man's use. Experimenters are naturally interested in keeping the price of plant food down; so are we, for the lower the price the more we will sell; and we are helping to do it by utilizing everything which contains plant food. Therefore, to question **in general** the agricultural value of well-made ready mixed fertilizers seems to me unwise, if not unfair, for it tends to discourage effort to utilize by-product forms of plant food, which must be in the interests of economic agriculture. Should not Government teachers be economists as well as experimenters?

What Farmers Demand

Practical hard-headed farmers apparently have found by experience, the country over, that it pays them to buy ready mixed, drillable fertilizers. Judging by the amount they are using in the United States—about 7,000,000 tons annually—that would appear to be a fair inference.

Out in Iowa a farmer wanted fertilizer for 600 acres of corn, but he insisted that the goods should be dry, drillable and in condition to apply all at one time **by machine.** Perhaps other farmers feel the same, for farm labor everywhere is scarce., dear and poor. Because farmers the country over demand dry drillable, "non-cakable," mixed fertilizers, bagged, delivered, and sold on crop time, is why the industry as a whole is selling 100 tons of factory mixed goods to 5 tons of unmixed, separate materials, and this ratio has not materially changed in many years.

Will It Pay the Middle West Farmers?

It may not now pay Middle West farmers to purchase commercial fertilizers to the extent of largely supplying what their crops remove. And yet I do not see why it will not pay to grow by intensive methods in the Middle West the **same** quantity of cereals on **half** the area and devote the remaining half of the land to grazing, thus reducing the unit cost of a bushel and increasing the live stock of the country; but this I feel sure of, that farmers will soon discover in the Middle West that it will pay them to use complete mixtures in order to hasten maturity and to improve quality—much as a stock breeder purchases some concentrates to give a complete balanced ration to a dairy cow, or to finish off a beef creature—much as he feeds a little milk along with concentrates to give a calf a good start. W. H. Bowker.

A GOOD SEED BED NECESSARY

The preparation of the seed-bed is the most important factor in growing a crop of wheat. An ideal seed-bed for wheat is a firm, well-compacted soil supplied with ample moisture and available plant food. To prepare a firm seed-bed, to store moisture, and to liberate plant food requires time. It is not accomplished in a day, a week or a month; it is the result of many days of settling, some good packing rains and frequent cultivation of the soil. It is, therefore, only possible to prepare an ideal seed-bed when the preparation of the ground is started early in the summer. The advantages of a firm seed-bed that result from early plowing or listing and frequent subsequent cultivation cannot be over-estimated. A firm seed-bed is absolutely necessary if the subsoil water is to be utilized by the young wheat plant. On loose, poorly packed soil there is such poor connection between the soil particles that moisture cannot be raised by capillary attraction from the subsoil. Under this condition the soil may be well supplied with subsoil moisture and the wheat fail to germinate because of the loose condition of the soil, which prevents the rise of water.

A firm seed-bed is only one of a number of benefits that result from the early preparation of the soil. Moisture is conserved and plant-food is made available in this way. The conservation of moisture results from the killing of the weeds that sap the ground of water, and from a looser condition of the soil that more readily absorbs rain. The cultivation of the soil after packing rains forms an earth mulch which prevents the loss of moisture by evaporation.

In the drier parts of the state perhaps the greatest benefit resulting from an early preparation of the soil is the conservation of moisture. Where moisture is more plentiful the greatest benefit results from the liberation of plant-food, and especially of the plant-food nitrogen. Plants use nitrogen in the form of nitrates. Nitrates are formed as the result of bacterial action. The bacteria that form nitrates work only in well-aired soils. Thus the better the soil is aired the more nitrates are formed. It is evident, therefore, that the greatest development of nitrates takes place in soil plowed the earliest and given the most frequent cultivation throughout the summer. Thus the firmest seed-bed, the most plant-food, the greatest accumulation of moisture and usually the largest yields results from the earliest preparation of the soil.

Kansas Agricultural College.

BARB WIRE INJURIES

This is the season of the year when stockmen are most frequently annoyed with barb wire injuries to their horses. Just a few things to bear in mind at such times have been suggested by Dr. A. S. Alexander, of the Department of Horse Breeding.

"After a barb wire accident, do not apply axle grease or any rancid ointment to the wound. Wash the wound thoroughly with warm water. Then clip the hair as close as possible around it, and wash again to remove any hair or other foreign substances.

"When sand or hair has lodged in the depths of a deep cut never use a wet sponge to clean it out. Use a piece of absorbent cotten or cotton batting. There will be much less risk of infection.

"It will be useless to put stitches in a wound that is very deep or ragged, or that is located in a place not in perfect rest when the animal is marking natural movements.

"Dry dusting powder has a healing effect on barb wire wounds and other large, moist cuts and abrasions. Such a powder may be prepared cheaply by mixing together equal parts of slacked lime, sulphur and charcoal.

"Prevent lock-jaw dangers in nail wounds of the hoof by opening them up freely, which provides drainage for serum and pus. Saturate with a solution of corrosive sublimate and water in the proportion of 1 to 500. Cover with dusting powder, absorbent cotton and a bandage. This treatment should be repeated daily until the wound is healed."

Write and tell us how The Missouri Farmer can be of greater service.

"Silage keeps best against wood, and nothing is lost around the edges."

That statement does not come from a silo manufacturer or a silo salesman. It's the published opinion of the Connecticut Agricultural Experiment Station after a five years' cold-blooded investigation and test.

You want a silo that will properly preserve silage and keep it sweet—free from mould and decay. You cannot afford to experiment with any other kind at any price.

Government and state experts agree that **wood** silos are the best suited to the perfect preservation of all silage stored in them—minimizing the dangers of restricted fermentation, mould and decay; and that wood silos are the least expensive to build.

Are not **Dependability** and **Cost** the sticking points with you in deciding on a type of silo Inform yourself, considering your own interests, and

You Will Use a Wood Silo

Furthermore, the wood you will choose for your silo will be Southern Yellow Pine, the wood that Government tests have proved to be by far the strongest, toughest, stiffest wood used in silo construction.

The Missouri Farmer

VOLUME VII JULY 15, 1915 NUMBER 14

The Improved Standard of Living Requires More Capital

By Geo. B. Ellis, Managing Editor

The man who would make as much gross return for his time as he did ten years ago must have more capital to work with or he must increase the amount of labor performed. For every dollar invested in farm property in the whole United States in 1900 there were invested two dollars and five mills in 1910. All farm property in this country, including the land, buildings, machinery and live stock, was valued at $20,439,901,164 in 1900 but this sum, too large for us to comprehend only by comparison, had in ten years grown to $40,991,449,090. Every item invested in the farm and its equipment shows a large increase in value for the ten years mentioned. The land itself more than doubled in value during the period and the buildings had increased by 69.8 per cent, the machinery by 61.8 per cent and the live stock by 52.6 per cent.

If we examine the figures for Missouri alone we find pretty much the same general average condition. During the decade all farm property increased in Missouri by 95.3 per cent. Land alone more than doubled and for every dollar invested in the farms of Missouri in 1900 there were $2.043 invested in 1910. Buildings on Missouri farms increased 78.7 per cent in value, machinery 75 per cent and the live stock equipment by 75 per cent. These figures taken from the United States census report teach us an important fact: We must work longer hours, we must do harder labor so as to accomplish more in a day or in a year or else we must have more capital to maintain the present size of our business.

It Requires $7,405 to Own and Operate the Average Missouri Farm

The young man starting to farm in 1910 in this state with the average farm of 124.8 acres of which 88.7 acres were improved land—to own this farm with an average equipment of buildings, machinery and live stock he would require a capital of $7,405, while ten years before he could have bought the same farm and equipment for $3,626. The man then who would farm on the same scale as the man of ten years before must do one of two things: He must either cultivate a less number of acres and fertilize and cultivate more intensively or he must have about twice as much capital to operate with. The so-called experts in the Department of Agriculture and in some of the agricultural colleges who have been telling us that the only profitable agricultural practice is more extensive agriculture, these fellows who would make us believe that much of our farming must be enlarged to make it profitable will have a great big task on their hands to find the necessary capital to work with. The fact is that to operate on the present scale of double the capital required ten years ago is about as hard a problem as the writer wants to undertake.

Costs More Now to Operate a Farm

If every man could inherit a farm and equipment to begin with it would not make so much difference although greater capital would be required to carry on his farming operations. Labor costs more now than it did twenty years ago and to economize in labor we must increase the equipment of labor-saving machinery and the buying of machinery takes more money. The feeding of farm animals is done on a less margin than formerly and there is therefore no longer a profit in feeding scrubs. Buying better animals either for breeding or feeding requires more capital and the only alternative, if we quit feeding live stock, is to turn our attention to grain farming and that as we know too well means the rapid deterioration of soils and the ultimate impoverishment of the farmers. Small margins in live stock feeding and dairying make it necessary to utilize the forage and save the former wastes and this can be done only by building better sheds and barns for storing the crops and by building silos to get the full feeding value of the corn crop.

In those things that go to improve the social, moral and educational life of the farmer and his family there is need for very much more capital than there was with the standards of living thirty or forty years ago. The pioneer could live content in the log house of a generation back because it was the rule, but today when one farmer builds a convenient and comfortable house, puts in running water, a bath and some modern method of heating and lighting, it sets a higher standard of living and every other farmer must make some effort to reach that standard or his family becomes dissatisfied with farm life and he will find the boys and girls leaving for the city and the good wife wanting to move to town. And why not? People have learned that we pass this road but once and we are entitled to all the intellectual, social and spiritual enjoyment our individual capacities are capable of holding. There is just as logical a reason for putting a good piano in the farm home as there is for putting it in the city home. I think there is a much better reason for in the city the members of the family, old and young, have many opportunities to hear the great singers that country people do not have. And so it is with books and the best magazines and periodicals where there is one reason for placing them in the city home there are two reasons why they should be in the country home.

A Higher Standard of Farm Life

Thousands of pioneer farmer folk went to church and to town in the old farm wagon, but is that any reason we should deny ourselves of the pleasure of riding in a carriage behind two good Missouri roadsters? And if the automobile gives more pleasure because of its greater speed is there any reason the farmer's family should not enjoy it? I am one of those who believe the farmer is entitled to the best the land affords if he can find an honest way to get it.

There is no longer any question as to the necessity for good roads as a factor in the betterment of country life but for years farmers, road officials, legislators, congressmen—in fact every one has been trying to solve the problem of finding the money for road improvement. And whether it is the social, moral, intellectual or economic advancement of country people that we are looking after the first and great need is for more—for larger capitalization.

Better Rural Credits the Remedy

New York and Wisconsin were the first two states to adopt measures to give farmers better credit facilities and Missouri followed closely after them with what we believe to be a much better system than either of the other states. When the people of this state approve the Gardner Land Bank Bill, which will be voted on at the general election next year, the first step will have been taken for the larger capitalization of the farmer's business. The first loan under this law will be made to farmers at the rate of 4.3 per cent annual interest plus a charge of one-half of one per cent for expenses or a total rate of 4.8 per cent. After the first issue of $500,000 is made the rate of interest will be governed by the rate the bonds will sell for in the open market. In the face of the much higher rate farmers have had to pay for their loans, the short time for which they have been made and the extra commissions they have had to pay, farmers have hesitated to borrow money for anything except for purchase money to buy land. If the farmer as a class, however, measures up to the standard of living of bankers, merchants, manufacturers, professional men and others they must use more capital for the improvement of their homes, for building good roads, for maintaining better schools, for increasing the fertility of their farms and other things necessary to the best development of farm life.

The Gardner Land Bank Bill is the first important step we should make to provide the larger capitalization of Missouri farms. No one should oppose this measure because it does not go far enough for if we take the first step in any progressive movement it is then easier to take the next and the next until finally we will reach the desired results. In time there will be need for increasing the amount of the loan above fifty per cent but we must bear in mind that we are entering a new field and must proceed caustiously to avoid mistakes that might hold us back for many years. Some are demanding better credit facilities for poor men who do not own any land and that, too, will come in time by organizing personal credit societies.

Live stock farms are more profitable than grain farms, but it takes capital to buy live stock. Silos are profitable, but it takes money to build them.

CAPITALIZING AGRICULTURAL SCIENCE

Abstract of address delivered before the American Bankers Association, Chicago., by F. B. Mumford, Dean and Director of the College of Agriculture, University of Missouri.

The time is too short and the purpose of this meeting are too important for me to waste any time in traversing again the theoretical discussions of recent years on the various phases of the Agricultural problem. If I shall be successful in pointing out clearly where the interests of the banker and those of the farmer are identical and the interests of both are likewise identical with the best interests of the American nation, I shall be fortunate indeed. But I will have still greater cause for felicitation if I can make such wise, sensible and concrete suggestions as shall appeal to practical men and which if carried out will promote the cause of better farming. increase the prosperity of the farmer and incidentally but no less certainly promote directly the interests of the banking industry.

Business Farming Comes First

The Agricultural problem is a complicated one. It is not alone a question of economics. It involves social intellectual and spiritual factors all of which must be solved before the business of farming will be entirely satisfactory to the farmers themselves, to the business interests of the country or to the commonwealth. While this is true it is also undoubtedly true that the farmers problem is today and always has been chiefly an economic problem. The solution of the economics of agriculture as related to the actual business of farming will carry with it the solution of many of the other problems of the rural community. The agriculture of America compared with that of Europe seems to be far less efficient. We should be slow to generalize extensively on the fact that European countries produce a much larger yield per acre, and that they profitably utilize land that is very low in fertility. It does not necessarily follow that the American farmer would find it profitable or possible to produce yields as large or to bring under cultivation land relatively so poor. The factors of labor, price of product and many other conditions must be recognized. But taking into account all the factors involved, it remains true that the American farmer can largely increase his profits, better maintain the permanent fertility of the soil, and incidentally materially increase crop yields.

The Agricultural Experiment Stations have definitely pointed the way to a peramnently prosperous agriculture. We are no longer in the dark as to specific methods of agricultural betterment. How can this knowledge of improved methods be brought to the farmer in a manner so convincing that he will embody it in his rules of practice? In other words how can this knowledge of agricultural science be capitalized?

Why Farmers Are Slow in Adopting New Methods

The American farmer as a class has been slow to adopt new methods fully justified from the standpoint of profitable economic returns. It is sometimes difficult for representatives of the modern organized industries to understand why farmers have not promptly accepted the teachings of the experiment stations and thus capitalize these results in actual practice. The managers of the organized industries like manufacturing, railroading or mining, have been prompt to adopt any new and improved method which gave promise of increased returns.

There are those among the organized business industries who have believed that the colleges of agriculture have been entirely too conservative in the extension of knowledge of economic value. Partly as a result of such conservatism, it is said the farmers as a class are less progressive than are the organized industries. I think even a casual investigation will demonstrate the fallacy of this argument. There is no question in my mind but that the more rapid progress made by the organized industries as compared with agriculture, is due to organization. If the general manager of a railroad is convinced that a change in method or the adoption of some new practice based upon scientific discovery will reduce the cost of operation and thus increase the net profits of the system, he promptly gives the necessary orders to all the officers of the company and the new practice is put into operation. There may be ten thousand men involved in the instructions given by the general manager but each member of this organization does the particular thing necessary in order to accomplish and make effective the important change.

The Farmer His Own Boss

But in agriculture, there are ten thousand individual land owners. It is necessary not only to convince one man or twenty men, but it is necessary to convince each one of the ten thousand land owners because each individual farmer is the general manager of his own farm. It does not matter materially in the railroad industry whether every individual workman understands the principles involved and is convinced that the new plan is a good plan. In agriculture it is necessary under our present system of organization or lack of organization to convince all the famers or a very great majority in order that the improved method shall be registered in the sum total of agricultural production.

The bankers of this country are peculiarly well situated to help in advancing the cause of better agriculture. In the Middle West, many bankers are also farmers and have an intimate knowledge of local agricultural conditions. They bear an even more important relation to the development of this industry as they hold in their hands the power to furnish the capital by means of which only can better methods be inaugurated.

Agriculture Needs More Capital

Recent investigations in rural economics have clearly indicated that agriculture in America is under capitalized. The very first step in agricultural betterment requires a much larger amount of capital in our agricultural operations than has been utilized during the past half century. Our soils are generally deficient in phosphorous and humus and in some localities are deficient in potassium also.

One of the most important steps which must be promptly taken by the average farmer of the Middle West is the purchase and application of fertilizers to be used along with a rational rotation. There is no question whatever but that the intelligent use of fertilizers will increase farm profits and benefit directly the individual farmer but fertilizers can not be purchased without money, and money cannot be secured except through the bankers.

It has also been definitely demonstrated by the agricultural experiment stations that the profits in farming might be largely increased by breeding a better class of live stock. If every horse in the United States that is offered for sale was a good horse adapted to a special purpose, it would increase our income from this source by many millions. If every beef animal shipped to market conformed to the best type of a special purpose beef the income from this source would be greatly augmented. The average cow in the United States produces less than 150 pounds of butter annually. On the same feed and with the same cost of equipment and labor it is possible to produce animals that yield 200 or 250 pounds of butter in the same time. If every dairy cow in the United States was a highly efficient milk producer the income again would be greatly augmented. But the American farmer cannot buy the best types of the various kinds of domestic animals without money.

And so I might continue to point out that practically every change in farm practice calculated to result in better farming means a larger use of capital. The real reason in many cases why agricultural improvement has not been more rapid is because either the farmer has not been able to secure money or did not feel justified in borrowing money at current rates of interest for agricultural improvement. It is not my purpose to discuss the question of farm credit, but I may be pardoned for making the suggestion before this association, that unless this question is solved in some way by the bankers it will be solved by the farmers and consumers themselves who are less expert in the subject of money and banking than are the members of this association.

Bankers Should Encourage Farmers

The farm management investigations by the United States Department of Agriculture and various states have also shown that the most profitable farms are those utilizing the largest proportion of movable capital as distinguished from fixed capital. The investments of the farmer which pay the largest interest are the investments in fertilizers, in good live stock, in good machinery and in other forms of equipment all of which contribute to the general improvement of agricultural practice. If the bankers therefore can encourage the intelligent and efficient farmer to make a larger use of movable capital in his farming operations he will be contributing not only to the economic success of the farmer himself but he will be helping the banking business by encouraging the use of money in profitable directions. Any banker or bankers association that is interested in the economic development of the agricultural industry in a given community can promote such development by encouraging the use of more capital on the average farm.

How can the banker encourage the use of more capital for the purposes mentioned? They can familiarize themselves with the facts which have already been determined by the agricultural colleges in reference to more profitable use of capital in the various enterprises of agriculture. They can help in the campaign to convince the farmer that it is more profitable to use fertilizer in a rational rotation and to breed better live stock. This the agricultural colleges have been doing for fifty years. These institutions have built up large and highly efficient extension organizations for this purpose. This is an educational campaign. It can best be made by institutions organized for that purpose. It would seem therefore that the greatest service that the bankers association can render to the agricultural industry in this respect is to stand behind the agricultural colleges in their educational campaign for the betterment of agriculture.

Cheaper Money Is Needed

What can the banker do to encourage the farm borrower to practice those methods of agriculture which are known to increase yields per acre, insure permanent prosperity and indirectly contribute to the upbuilding of the commercial industries, including banking, in the rural sections? This is the day of the Farm Adviser. The farmers have frequently complained that the men engaged in commercial industries, including the bankers, manufacturers and railroad officials have been advising the farmer how to conduct his business. To turn about is fair play. If you will allow a farmer to give advice to bankers, I should like to suggest at this time that the power lies within the hands of the bankers of this country to accomplish more in the development of improved methods of agriculture than rests in the hands of even the agricultural colleges themselves. In some farm communities the soils have become so exhausted that profitable agriculture is almost impossible. In such communities, the use of fertilizer and leguminous crops is absolutely fundamental to any development. Why not loan money out at a very low rate of interest for investment in those methods of farming which will certainly prove profitable. The experiment stations in most states are able to give definite concrete advice based upon investigation made in the local community. Why should not bankers loan money to farmers at a cheaper rate for the buying of registered sires? It is within the power of the money lenders to bring about agricultural improvement by this method. It is worth your careful attention.

In conclusion the bankers of America can promote the cause of better agriculture by co-operating with the agricultural colleges in educational enterprises already existing, by promoting the location of county agricultural agents in every county of the United States; by definitely encouraging better farm practice; by loaning money at a lower rate of interest for the purchase of phosphorous or lime or building silos, or seeding to alfalfa or for registered sires and for all other enterprises which have been demonstrated to be in the interests of a permanently prosperous agriculture and by definitely helping to create public sentiment which shall be registered in legislative appropriations for the support of the educational plans of the agricultural colleges.

How Often Shall Corn Be Cultivated

At the Illinois Agricultural Experiment Station, in a test lasting five years, corn cultivated to an average depth, three to five times as the varying seasons required, yielded 68 bushels per acre, while that cultivated nine to fifteen times yielded but 68 bushels per acre. In years when the soil is packed by heavy and frequent rains and weed growth is correspondingly troublesome, cultivations must necessarily be more frequent than the opposite conditions exist. It is also probably true that cold, wet heavy soils need more frequent cultivations than do the opposite kind. In actual practice, however, it seldom pays to cultivate less than three times or more than five times.—Nebraska College of Agriculture.

SOIL IMPROVEMENT

It will be accepted as a self-evident truth that impoverished soil yields no profits, either to agriculture, to industry, or to commerce; and, consequently, that continued prosperity for the masses in America depends primarily upon the maintenance and improvement of the productive power of our farm lands, for agriculture is the basic support of this great nation. Land whose gross return in yearly crop values amounts to only $4 or $5 per acre cannot support a system of soil enrichment, except the materials are supplied at the lowest possible cost. It is impossible, as a rule, for the owners of poor land to pay large profits to producers and to transportation companies for those materials which are essential for the improvement of their lands. This is a fundamental truth or principle which ought more generally to be recognized by men of influence. Thus the railroad company that insists upon making profit from hauling ground limestone for use in the improvement of poor sour land along its line will make soil improvement impossible; whereas, if the expense to the landowner is reduced so that he is enabled to adopt a system of permanent soil enrichment, then both commerce and industry will prosper from the increased business resulting from the greater crops produced.

Shall We Not Learn From the Mistakes of Others?

For men of responsibility to ignore this basic truth can lead only to land ruin and ultimately to commercial and industrial suicide. Shall we not learn a lesson from the mistakes of our older states? The fact that 45 per cent of what was classified in 1880 as improved farm land in New England was found agriculturally abandoned in 1910 should lead the men who fix prices and rates to look beyond the first dollar and make possible a continuous source of revenue.

The decrease since 1880 in the area of improved farm land in New England, New York, New Jersey, and Pennsylvania aggregates 9,809,834 acres, as reported by the United States Bureau of Census. This acreage of abandoned farms is equal to the total area of forty Illinois counties. In New England the area of agriculturally abandoned land is more than twelve times the total acreage of all cereal crops grown in those states.

I repeat that we should profit from the mistakes of our older states. The greatest material problem for both town and country in the great Middle West is to bring about the adoption of systems of farming under which old land shall become richer than new land. And this is possible, feasible, and profitable; but not by the use of small amounts of such mixed manufactured fertilizers as the farmers of the older states have been induced to purchase at high prices and to apply to their farms in systems of soil stimulation and ultimate land ruin.

There are three lines of soil investigation which should be encouraged and carried forward in every state. These are soil surveys, soil analyses, and the operation of soil experiment fields. An accurate soil survey discovers the different kinds or types of soil and ascertains the extent and boundaries of each type, even down to five-acre lots. The soil analysis determines the amount of every important element of fertility contained in each kind of soil, and indicates what element or elements are deficient and must be applied in order to make permanent soil improvement possible. The soil experiment field establishes the rate at which the existing fertility may be liberated for plant growth under rational systems of farming and also demonstrates the returns under actual field conditions from investments in materials needed for postive soil enrichment.

Such investigations are altogether feasible, and they yield results of the greatest value for practical application in general agriculture. The expense involved is not large. Indeed it is exceedingly small when measured by the need and importance of the work or by the magnitude of the task. Thus the commonwealth of Illinois is expending for the investigation of Illinois soils 1 cent a year for every three acres of farm land in this state—.3 of a cent an acre a year; or 30 cents for a hundred years; but at the present rate of progress, the Illinois soil survey will be completed in less than a dozen years.

The Railroad Must Co-operate

It is not enough, however, for the University of Illinois to survey and analyze the soils of the state and to discover and demonstrate the most practical systems of permanent soil improvement. The limstone, phosphate, or other materials needed for soil enrichment, must be produced and transported and delivered to the farmer at a price he can afford to pay. This requires co-operation between the transportation companies and the state university, a kind of co-operation which already exists in this state. The railroads of Illinois have made and maintained very reasonable freight rates upon these materials which are most fundamental for permanent soil improvement; but this is not yet the case in all states.

Let me report a specific illustration showing some of the difficulties and something of the possibilities in permanent soil improvement.

In 1909 a certain tract of land was selected to represent the most common prairie soil in twenty counties of southern Illinois. A good crop rotation was practiced, good seed was used, and the farm work was well done; but the total returns per acre are represented by 10 bushels of wheat in 1910, by 16 bushels of corn in 1911, by 12 bushels of oats in 1912, by 400 pounds of hay in 1913, and by 2 bushels of wheat in 1914, the last two years having shown poorer results because of a severe drouth.

On another part of the same field the respective yields per acre from 1910 to 1914 were 8 bushels of wheat, 30 bushels of corn, 34 bushels of oats, 1620 pounds of clover hay, and 22 bushels of wheat.

Applied Fertility Made $10.45 an Acre

If we count wheat at $1 a bushel, corn at 50 cents, oats at 40 cents, and hay at $10 a ton, the average annual return per acre for the last four years has been $4.20 from the one part of this field, and $14.65 from the other part. But the soil was of the same character on both parts of the field; the plowing and preparation of the ground were the same; the same kind of seed was used; and both tracts were warmed by the same sun and watered by the same rains. What, then, made the difference of $10.45 in the average yearly return per acre? The answer is expressed in the one word: fertility—not inherent or native, but applied fertility. Of the $14.65 we may credit $4.20 to the land itself, $2.32 to the application of all the farm manure that could be made from the crops grown, $4.78 to 1 ton of ground limestone, and $3.35 to 500 pounds of fine-ground rock phosphate.

In another experiment, where no farm manure was used, the average yearly return from the land itself was $3.75 an acre, while $7.00 was the return from a ton of limestone and $2.65 from 500 pounds of phosphate.

In order to reduce the labor involved, the limestone and phosphate are actually applied in larger amounts at less frequent intervals; but thus far the rates of application have been 1 ton of limestone and 500 pounds of phosphate per acre for each year, although, after the soil is sufficiently enriched, one-half or one-third these amounts will provide for maintenance.

These Things We Know

The principles of permanent improvement for most soil types are already well established. They include the use of ground limestone for correcting soil acidity and for enrichment in calcium; the utilization of atmospheric nitrogen by proper use of legume crops, the application of phosphorus to most soils, and the liberation of potash from the inexhaustible supply already contained in all normal soils. On some soils dolomitic limestone should be used in order to provide both magnesium and calcium; and on certain abnormal soils, such as swamp muck and residual sand, potassium must also be applied.

The solution of the problem of permanent agriculture in America deserves and will require the best thought of the most influential people; and the man who thinks farm products are high in price may learn a lesson in the fundamentals of national economics by trying to build up a piece of impoverished land from the income it produces.

If there is one agricultural fact that needs to be impressed upon the American people, it is that the farmers of this country have been living, not upon the interest from their investments, but upon their principal; and whatever measure of apparent prosperity they have had in favored localities has been largely taken from their capital stock.

That vast areas of land, once cultivated with profit in the original thirteen states, now lie agriculturally abandoned at the door of our greatest markets, is common knowledge; and that the great majority of the farm lands in the North Central states is even now undergoing the most rapid soil depletion ever witnessed, is known to all who possess the facts.

The boastful statement sometimes made, that the American landowner has become a scientific farmer, is as erroneous as it is optimistic. Such statements are based upon a few selected examples or rare illustrations, and not upon any adequate knowledge of general farm practice. Even to this date almost every effort put forth by the mass of American farmers has resulted in decreasing the fertility of the soil. The American farmer does everything except to restore to the soil the fertility required to maintain permanently its crop-producing power.

Larger Crops Are at Expense of Fertility

Thus, tile-drainage adds nothing to the soil out of which crops are made, but only permits the removal of more fertility in the larger crops produced on the well-drained land. More thorough tillage with our improved implements of cultivation is merely "working the land for all that's in it." The use of better seed produces larger crops, but only at the expense of the soil. Clover and cowpeas, as commonly produced and harvested, add little or no nitrogen to the soil. All the domestic animals on all the farms of the United States are equivalent to less than one cow for each ten acres of farm land, and the farm manure is so limited and is spread so thinly that it adds but little fertility to the soil in comparison with that removed in crops and sold in grain and hay, and in bone and meat and milk.

All these are good farm practice, and they should be continued; but we ought also to stop exporting millions of tons of phosphate which is needed on our own lands. We should also apply millions of tons of ground limestone to our acid soils, and we should produce more legume crops, to be plowed under directly or in farm manure. The world must have bread as well as meat, and the decision between live-stock and grain farming must always be based upon preference and profit, and not upon the erroneous assumption that farm manure is either necessary or sufficient for the maintenance of soil fertility.

If the farmers of the great corn and wheat belts of the North Central states are ever to adopt systems of permanent agriculture, it must be done while they are still prosperous, or they too will sometime awake to find their lands impoverished beyond self-redemption.

I realize, of course, that the presentation of these facts is far less popular than boasting of achievements not yet accomplished; but I also realize that the six New England states are now producing less total cereal crops than one county in the Illinois corn belt, and that ten million acres of tillable lands lie unused in old Virginia, because the crops they are capable of producing without enrichment will not pay the cost of production.

Intelligent optimism is admirable, but fact is better than fiction; and blind bigotry paraded as optimism is dangerous and condemnable. Let us face the facts, and proceed intelligently to solve the problem of permanent agriculture for America; with the sincere and helpful co-operation of the banker and farmer, of the farm press and the farmers' institutes, of the farm advisers, the college of agriculture, the railroads and the state.—Dr. Cyril G. Hopkins, in an address before the Banker and Farmer Conference, July 7, 1915.

HOW TO GET RID OF HOG CHOLERA

J. W. Connaway, D. V. S., M. D., Veterinary Department, College of Agriculture and Experiment Station, University of Missouri.

[This article is a continuation of the articles in previous issues and will be continued until the whole subject of hog cholera control is thoroughly discussed. We suggest that every swine raiser who reads The Missouri Farmer should file away all these papers containing this article and they will then have the most valuable treatise on hog cholera that has been published.—Editor]

(4) **The control of infection carriers:** The most dangerous infection carriers with which the farmer has to deal are the **sick** and **exposed** hogs; and the control of these in properly constructed isolation sheds and pens has already been mentioned. The driving of sick hogs upon the highways to market is prohibited by law; but the law is sometimes broken by those who are ignorant of the provisions, and sometimes by those who know the requirements of the law, but ignore them, and have no regard for the rights of their neighbors. **Sick hogs** should never be removed from the farm, but should be closely quarantined until they have recovered, or have died. And the infection and infected carcasses should be destroyed. The shipment of sick hogs to market, even when hauled to the shipping station, spreads the disease, and increases the dangers at the local and large central stock yards; as well as being a source of danger to the farms lying along the railroad lines.

Healthy hogs that have been exposed to sick hogs in the same feeding pens may transmit the disease from contamination of their feet and bodies, and should not be **driven** over the roadways to market. They should always be hauled to the shipping station. If driven to market the farms along the highway are endangered. Streams crossing the highway and passing through one or more farms may become sufficiently contaminated from the feet and bodies of the hogs to start an outbreak. Only healthy hogs, from clean farms, should be driven to market; and it is probably a good practice to haul these, on account of the shrinking in weight from driving.

Cattle that have been fed in feed lots where hogs have been dying from cholera may also carry the infection on their feet when driven to market, and spread it along the highway, from whence it may find its way to adjacent farms. The feet of cattle may be easily disinfected by driving the animals through the dehorning chute, in the floor of which every farmer should have a shallow vat, preferably of concrete. The vat should be the full width of the chute and 8 or 10 inches deep. This vat is serviceable in the treatment of sore feet in all farm animals particularly cattle and sheep. A strong solution of copper sulphate (blue stone), or a 5 per cent solution of the Compound Cresol Solution should be used to clean and disinfect the feet of cattle that have been on cholera infected grounds.

The danger of a recently purchased lot of feeding cattle carrying the disease from an infected stock yard to the farm should not be overlooked, and proper precautions should be taken to disinfect the animals' feet, before hogs are exposed to them.

Dogs: It is well known that dogs serve as carriers of cholera infection. It is therefore advisable, during outbreaks of cholera in the neighborhood, to keep all valuable dogs in quarantine, especially at night to prevent them roving about and visiting cholera infected farms, where carcasses may have been left unburned. Worthless stray dogs should be destroyed.

Barn-yard fowls: The infection is easily carried by **chickens** and **turkeys** from the roadway along which diseased hogs have been driven, or from an infected pen to clean pens, on other parts of the same farm. These fowls should be shut away from the hog lots, during outbreaks of hog cholera on the farm, or in the neighborhood. A few dollars spent in poultry netting will be less expensive than buying serum; and will often save hundreds or thousands of dollars to the neighborhood. **Pigeons** are more dangerous as infection carriers, because of their habits of flying to neighboring farms and feeding with hogs that may be suffering from hog cholera. The pigeons should be destroyed; or should be kept in confinement when cholera is in the neighborhood. **Buzzards** and **crows** should be dealth with by shot-gun quarantine. "Simultaneous" and repeated attacks upon the roosting camps of these undesirable birds, by "Farmers' Clubs" or "anti-hog-cholera clubs" will soon rid a neighborhood or county of these infection carriers.

Undesirable persons: The traveling hog-doctor, with his "sure cure" and "preventive" for hog cholera, and all other ills to which swine are subject, should not be a welcome visitor; for he is liable to be an infection carrier. His business takes him to diseased herds; and as a rule these business parasites are not careful to thoroughly disinfect their contaminated shoes and overalls after treating (?) a diseased herd. The itinerant "vaccinators," and the local "farmer-agents" for serum companies are also undersirable visitors; they are more interested in the "commissions" and "fees" than in sanitation; and more likely to spread cholera virus on your farm "with both hands and both feet," than they are to give relief from a threatened danger from other sources. The local stock-buyer is a valuable go-between, for the farmer in marketing small lots of hogs; but he becomes a nuisance and menace, if he forms the bad habit of seeking for bargains in diseased and badly exposed herds. He thus aids in maintaining infected pens at the local stockyards, and carries infection on his shoes to healthy herds and clean farms. The owners of healthy herds should keep stock-buyers out of their hog lots, if they have come from infected premises and have not properly disinfected their shoes. Stock-buyers should join the farmers' "anti-hog-cholera clubs" and do everything they can to aid in eradicating cholera by applying proper sanitary measures. It will serve their own business interests in the best possible manner.

Teams and wagons: Cholera infection may be carried to healthy herds and farms by teams and wagons. Threshing outfits that go from farm to farm should be careful to not drive through cholera infected hog lots, or in fact through healthy hog lots. Inquiry should be made as to the presence of cholera on the farms where threshing is done. And every precaution should be taken by every man on the force to avoid coming in contact with the infection, and to prevent the teams and wagons from doing so. When hogs are hauled to the local stock yards, it is a wise precaution for the farmer not only to disinfect his shoes, but also to disinfect the feet of the team, and the wheels of the wagon, before returning to the farm. Especially if sick hogs have recently been unloaded in the local stock yards. Also disinfect the inside of the wagon box, and the litter it may contain. (See "Chemical Disinfectans"—under Disinfection).

Streams: Hog cholera infection may be carried from one farm to another by the water courses that run through them. It is not the fault of these streams if they become polluted and carry disease; but the fault of the farmers through whose farms the streams run. For by co-operation, and by observing the precautions given above, it will be rare for a stream to become polluted. We cannot change the general course of the streams, nor stop them from flowing; but we can protect them from pollution with hog cholera infection. Sick hogs must not have access to the streams; dead hogs must not be permitted to rot in them; and cholera infected litter and manure must not be allowed to wash into them; these things we can control. But when danger from such a source does occur, losses can be avoided by removing the healthy herds to other fields away from the infected stream. Or the stream can be fenced off from the field occupied by the hogs.

In our county organization plan (see "Organization and co-operation") every member of an "anti-hog-cholera club" regards it as a special duty, to notify the owners of farms whose herds may be endangered by the drainage from his infected farm, and this practice is recommended to farmers in counties not yet organized.

Ponds: On farms where the stock water is supplied from ponds, these ponds may become sources of danger, if not protected from pollution. The pond should be fenced in so as to prevent the hogs from wallowing in it. One sick pig may endanger the whole herd by infecting the pond. Dogs should also be fenced out; for roving dogs have a fondness for stock-ponds, as well as for cholera carcasses, and may infect the pond. The fence should be made of woven wire of proper height, and the top should be guarded by a couple of barbed wires. Watering troughs, set at a level lower than the pond, and at any distance desired, can be kept full of water by means of water pipes and automatic "cut-off."

It is also a wise precaution to protect the drainage area above the pond by fencing out the farm stock, particularly the hogs, since the drainage will carry some of the droppings into the pond. These droppings, even if free from hog cholera germs, often contain great numbers of intestinal worms and their eggs. The drainage area should be put in meadow grasses for hay crops.

Stock cars: Stock cars that have transported diseased hogs may carry hog cholera infection long distances if the litter and cars are not properly disinfected. The recent experience of a number of states with foot-and-mouth disease calls attention strongly to the danger of spreading disease by means of stock-cars.

Provision has been made by the Federal Bureau of Animal Industry for disinfecting cars that have carried hogs to the large markets for slaughter, whenever an interstate shipment is found to contain sick hogs. And a number of states have regulations requiring a "health certificate," and proper disinfection of the cars, for hogs shipped into the state. Adequate provisions, however, have not been made, in many states at least, for the disinfection of cars that have carried hogs from one locality to a distant part of the same state. This is a matter that is left largely to the discretion of the shipper and consignee. And the neglect to disinfect the car at the starting point before loading the hogs, and again at the destination after unloading has, at times, resulted in the spread of cholera. The transportation of infected hogs across the state can scarcely be accomplished without the dropping of infected litter along the right-of-way, and at the terminal station. Many outbreaks of cholera, which have spread widely over a neighborhood, have originated from the shipment of feeding hogs from a distant part of the state, or from an adjoining state. Even shipments of supposedly immune hogs (serum-virus treated) have carried cholera long distances; in one instance, from Missouri to Indiana.

Shippers, consignees, and railroad agents should co-operate to lessen the dangers of spreading cholera through infected hogs and stock cars, even if no official regulations governing the matter are in force. For the business interests of all three will be promoted by getting rid of cholera.

A MILLION DOLLAR ARTICLE

Quincy, Illinois, July 10, 1915.

The Missouri Farmer:

Please send me about a dozen copies each of the June 15th number and the July 1st number of The Missouri Farmer, and put me down for as many copies of all of the following numbers which contain Dr. Connaway's million dollar article on "How to Get Rid of Hog Cholera." I want to send copies of the paper containing this article to a number of my good farmers around here who are still strong believers in the serum-virus method of vaccination.

You see I want the value of this article to spread over into Illinois as much as possible. I really wish the article might be published in bulletin form so that I could put it in the hands of every hog raiser in Adams County. If I could get the farmers in this county to put Dr. Connaway's suggestions into practice the article would be worth a million to this county, and the expense of carrying on the work of the Adams County Farm Improvement Association would be paid in advance many years.

Yours very truly,
E. W. RUSK,
County Agent, U. S. Department of Agriculture.

THE LIMING OF MISSOURI SOILS

M. F. Miller, Department of Soils, Agricultural Experiment Station

The need of lime on many Missouri soils is becoming so evident and the interest in its use is increasing so rapidly that many inquiries are coming to the Experiment Station regarding this matter. In a previous article on lime, 'I discussed the need of lime on Missouri soils. I endeavored to point out that not all soils in Missouri need lime but that a great many do, particularly the older farm lands, the level prairies of northwest and southwest Missouri, and the more worn timbered lands in both north and south Missouri. In general a soil which grows clover well is not in need of lime, although there are many soils which fail to grow clover for other reasons than a low lime supply, particularly a low supply of organic matter, poor drainage, and in some cases a low supply of phosphorus. In a few cases in the state it is quite possible that clover failures have been

due to insect and fungus troubles. The litmus paper test which is very often recommended for determining soil acidity is only fairly satisfactory but if a man will follow instructions closely he can get a fair idea as to the general need of the soil for lime. The Department of Soils of the University sends out to all inquirers a small amount of litmus paper together with directions for making a litmus paper test.

Where a man has determined that his soil needs lime, the kind of lime to use becomes a very important consideration. In general the Experiment Station has found that ground limestone is normally the best form to apply. Water slacked lime or air slacked lime may be used where it can be secured at a low price but as a rule the ground limestone is the cheapest for a unit of sweetening power. Fresh water slacked and fresh air slacked lime are both somewhat more active in sweetening soils than ground limestone, 1500 pounds of either of these being approximately equivalent to 2000 pounds of ground limestone. Old air slacked lime is closely equivalent to ground limestone in sweetening power. Twelve hundred pounds of fresh burned stone lime or lump lime is equivalent to 2000 pounds of ground limestone. This of course must be slacked before it can be used unless it can be ground, the grinding of the lump lime being rarely done in Missouri. From these figures one can readily calculate which of these limes would be the cheapest on his place by securing delivered prices of each from the companies putting them out and figuring on the cost of hauling.

Much interest is being shown in the home grinding of limestone and while few plants have thus far been installed in Missouri, the interest manifest emphasizes the fact that the time is coming when a great amount of limestone will be ground. A number of companies are putting out small and medium sized outfits designed for farmers and groups of farmers. The Experiment Station has not taken up the matter of the cost of grinding limestone from an experimental standpoint but there seems little doubt from the experience of men who are familiar with this method that lime can be ground by these small grinders at a very reasonable figure. This is about the only way that lands back from the railroads can ever be limed. It would seem that the most satisfactory method of handling this proposition would be for several farmers to buy such a grinder in co-operation or for one man to buy the plant and grind for the neighborhood.

The fineness to which limestone should be ground depends considerably on conditions. It costs more to grind some limestone than others because of their hardness. Again it may be cheaper in the long run to use somewhat larger quantities of a limestone, ground only to a medium fineness, if this can be done at the same acre cost, than to use an average amount of very finely ground limestone. In general, it can be said that limestone should be ground to the fineness of cornmeal or finer. A statement that is sometimes made is that it should be ground so that ninety per cent of it will pass a twenty-mesh sieve, that is, a sieve having twenty meshes to the linear inch or four hundred to the square inch. If seventy-five per cent passes the twenty mesh sieve, however, this is fairly satisfactory grinding.

No state in the Union has larger quantities of high grade limestone for agricultural purposes than Missouri. The best grades of limestone for this purpose are the high calcium limestones. These are found in a belt bordering the Mississippi river on the east, a narrow belt extending from near St. Louis practically to Sedalia, about one county wide, that part of northwest Missouri lying west of the counties Mercer, Grundy, and Livingston, and about a dozen counties in southwest Missouri. The bulk of the Ozark region is underlaid by a limemagnesium stone which is almost as satisfactory for agricultural purposes as the high calcium limestone, but it would be classed as second in preference.

Lime is best applied to land if the land has been broken and harrowed once or twice so that it can be run over with a wagon or lime scatterer. It should then be thoroughly disked and harrowed into the surface three or four inches of the soil. It is not usually wise to plow under lime nor to use it as a top dressing, except in a case of permanent pastures. In order that lime may have its full effect in sweetening the soil, it should be in a fine state of division and thoroughly worked into the soil. When wheat is grown it is usually best to apply lime after the land is plowed for wheat. There is usually more time at this season of the year and the roads are better for hauling. Where clover follows wheat the lime will have been in the soil long enough to have a very valuable influence on the clover crop.

Lime is best scattered by a lime scatterer. These implements are now on the market and at prices varying around forty to fifty dollars for an eight-foot size. Where one is to apply much lime, this is the most economical way to do it. As the lime spreader is only used occasionally, however, this is an implement which several farmers can well buy in co-operation. A manure spreader may be used by tacking burlap on the apron, but a lime spreader is much to be preferred where a great amount of liming is to be done. The liming may, of course, be done by dumping in small piles and scattering with shovels but this is a laborious process.

The Experiment Station has recently published a number of bulletins giving the results of experiments on various soil experiment fields in the state, all of which discuss the use of lime as well as of fertilizers and manures. Nos. 119, 129, and 130 deal with south Missouri soils and Nos. 126, 127, and 128 with north Missouri soils. These may be had without charge by addressing the Experiment Station at Columbia and asking for the numbers desired. The Department of Soils also keep on hand a list of companies putting out ground limestone, limestone grinders and ground limestone scatterers which will be sent on application.

BETTER STACK YOUR WHEAT

If the weather continues showery there will be a lot of damage to poorly shocked wheat. Every wheat raiser should make great effort to get his wheat in the stack at the earliest possible date. In writing along this line, W. L. Nelson, of the State Board of Agriculture, in a recently published bulletin says:

Had the Missouri wheat crop of 1914, amounting to some forty millions of bushels, been stacked and thus held until the advance in market prices it would have meant a net gain to Missouri farmers of not less than $10,000,000. Such a marked increase in value would, of course, not hold true for the average season. The unusual wheat market of the last few months has been due in large part to conditions brought about by the European war. However, it is true that, taking one year with another, it pays to stack wheat. "For thirty years I have been stacking my wheat and taking one year with another it has made me money." This is the testimony of Chris Smith, a prosperous Cooper county farmer. Mr. Smith says, "It is generally true that wheat prices are low immediately following harvest. Nor do prices advance very much until the speculators get filled up. Last year especially it paid me well to stack. Nearly all of my neighbors who threshed out of the shock sold their wheat at 70 cents per bushel, while I got $1.10 for the first I sold and $1.45 for all that was hauled later."

THE MISSOURI FARMER

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

Vol. VII July 15, 1915 No. 14.

William Hirth - - - Publisher
Geo. B. Ellis - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year in Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct, always inclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

CALF FEEDING PROFITABLE

The Kansas Experiment Station has just completed a trial in calf feeding with some very interesting results which show the possibility of getting a profit on feeding very high priced calves. Last October one hundred high grade Hereford steer calves were purchased and the top forty-five head were selected for the feeding trial. One lot of fifteen which averaged 540 pounds at the beginning costing $8.50 a hundred or $45.90, were fed on ground corn, cottonseed cake, sorghum silage and some alfalfa hay. The calves were fed 180 days and the cost of feed was $35.38 a head. The calves sold on the Kansas City market for $9.50 a hundred, a top price, and made a profit of $1.24 a head. No feeder would want to take the risk of feeding on this small margin but the man who produces his own silage and alfalfa hay will find a better market for them fed to cattle than to sell these feeds on the market.

The corn fed these cattle was valued at 70 cents a bushel, which is above the average farm price for corn sold off the farm. The silage was valued at $3 a ton and with a yield of fifteen tons an acre the farmer would be getting $45 an acre for his sorghum silage. And this is an important point no farmer should lose sight of: That when forage crops can be grown on the farm and fed to cattle at a reasonably fair profit and by buying cottonseed meal to supplement the corn and silage the farmer has adopted one of the surest and best methods for maintaining the fertility of his land, provided, of course, that the manure is carefully saved and applied.

In commenting on the experiment Professor Cochel, head of the animal husbandry department, says: "Although the net profits are not large they show that the farmer having calves weighing 540 pounds in December could have fed them out with greater profit than to have sold them at that time for $8.50 per hundredweight and in so doing could have furnished a market for sorghum silage at $3 per ton or $50 per acre, based upon local yields. This does not take into consideration the pork which is produced in connection with feeding cattle nor the value of manure which is estimated at three loads per steer."

We think the raising and feeding of a few calves every year is a safe line of work for the average farmer to follow. Its advantages compared with grain raising are that more of the farm can be kept in grass and other uncultivated forage crops thus saving the great loss from washing of the soil; the manure can all be returned to the land; the crops are easily marketed after being fed to the cattle; instead of buying so much fertilizer the cottonseed meal is bought to enrich the manure but returns its value in the gain put on the cattle.

The price of cattle will continue to go up and down as it has in the past but the farmer who raises his own cattle and feeds them forage raised on his own farm will be ahead of the grain raiser most every time.

SOW GRASS

If there is one thing deserving our serious attention more than another concerning crops just now we think it is how to increase our profit from grass crops—pastures and meadows. The Missouri Farmer has kept before its readers both in and out of season the fact that the greatest loss our farms sustain one year with another is the loss of soil fertility caused from surface washing. Aside from the benefits from drainage, terracing and deeper tillage, the one thing we can do to reduce this loss to a minimum is to quit plowing so much land and grow grass.

Many of our Missouri farmers believe that they can not afford to keep high priced land in grass, but we doubt if high priced rolling lands can be kept profitably in any other crop except of course the uncultivated legume crops which for practical purposes are classed with the grasses.

If the farmers of Europe can afford to keep land in meadows and pastures which has a value two or three times as much as our best lands, then why does any one doubt that we can do the same thing? The grazing of lands reduces the amount of hard labor and the amount of annual expense in the use of machinery in very great proportion and a less gross return may, on this account, show a greater net profit.

In the first place we should give more attention to pastures and meadows and keep out the weeds just as zealously as we do out of our corn fields. Then we should sow a great number of varieties so as to take advantage of the different seasons. And finally we should take the same pains to fertilize our grass crops with barnyard manure or with commercial fertilizers that we take with the wheat or corn crops.

More grass and fewer acres to plow will be a good motto for most farmers in Missouri to follow.

ALFALFA ON EVERY FARM

We do not know who coined this slogan, but that is immaterial, it is a good slogan any way and one we would like to see adopted in every county in the state. Alfalfa can not be grown on any kind of land without some effort but when we understand the needs of the crop better we will be able to grow it successfully on most every farm in the state. We do not think it advisable for many farmers at least to undertake to devote their whole farm to growing alfalfa, but on every farm where mixed farming is followed, this crop certainly has its place.

We recently had a pleasant visit from Sam Jordan, who has for the last three years been farm adviser for Pettis County, and we found him to be more enthusiastic than ever about the value of alfalfa. When Jordan went to Pettis County there were only about ten farmers growing alfalfa so far as he could determine, but now he has a list of over two hundred who are successfully raising it, and of the whole number co-operating there have been but five failures, and the cause of failure was ascertained in every case. There are few crops, even the standard crops, that will not show as many failures as five to over two hundred successful ones.

Mr. Lewis Monsees, one of the best known farmers in the state, has eight acres growing on up land, originally timber land, that produced from the first cutting this year two tons of cured hay and the second crop ready to cut July 4 was estimated at two tons per acre.

W. E. Files, near Lamonte, has eighteen acres on high prairie land treated with a ton of limestone and two hundred pounds of raw bone meal, which produced one and trhee-fourths tons the first cutting and the second estimated at two tons. Both these fields were seeded last year.

John R. Gentry has a field sown two years ago, the first cutting yielded two and a half tons and the second about as good. The illustrations given us by Jordan ought to satisfy any of our readers who are asking for practical examples of the success of the crop.

It has never been claimed by the most enthusiastic alfalfa "cranks" that alfalfa could be grown successfully on the so-called hard-pan prairie land, but Jordan says they have a field growing on just such land near Green Ridge that proves that it can be grown even on this kind of land. The trouble on this kind of soil is "heaving" or lifting out by freezing, and the remedy there is to work the land down very compactly and after a stand is secured to pasture rather heavy late in the fall and the tramping will to some extent prevent "heaving." We think possibly on this kind of land spring seeding will prove the best as it will give the alfalfa a much deeper root system to withstand the winter.

If our readers want practical experience as proof here it is, and there are hundreds of other examples all over the state. If there has been a failure in your neighborhood do not accept that as proof that it will not grow successfully until you have made some effort at least to find out the cause of failure. It will pay any man who has no alfalfa on his farm to take a day off and go and see some one who has made a success of growing it. It might be that the same information could be obtained from reading The Missouri Farmer closely, but if there is any doubt in the mind of any one let him hunt up some successful grower and get the information first hand.

In another column of this paper Mr. Williams of Polk County tells us of growing three tons a season on gravelly land that would produce not more than ten bushels of corn per acre. This looks like a fake story to those who know nothing about the crop, but it is the statement of a man well known in his county and the facts may be verified by any one who is interested.

When we get to growing alfalfa quite generally we may expect plant diseases and insect pests to be a handicap just as rust, blight, chinch bugs and Hessian flies are handicaps in growing wheat, but a few years growing alfalfa will help to get rid of the wheat pests and after that we can get bigger crops of wheat and corn off the alfalfa land. If your present crops are not entirely satisfactory, then why not join in with the alfalfa brigade and shout "Alfalfa on Every Farm?"

FEEDING ALFALFA HAY

A reader of The Missouri Farmer writes that he has been feeding alfalfa hay to his work horses this summer on account of the scarcity of native hay and his horses are not doing well. It seems to affect their wind somewhat and the kidneys are affected. We doubt if there is any one thing done on the farm that is so poorly understood as the feeding of hay to horses and mules. In the first place a great deal of the hay fed to horses is unfit for feed because it is mouldy, dusty or because it stood so long before cutting that it was overripe, woody and much of it indigestible.

The practice of filling the manger with hay and allowing the horses all they will eat is bad. Even where the horses are fed a liberal grain feed we have always found it best to limit the amount of hay fed each day so that at least once a day the hay would be entirely cleaned up. Too much hay makes so much bulk in the stomach and the dry hay calls for so much water that it puts the horse in a very uncomfortable condition when he goes to work. We have heard farmers say that when feeding damaged hay that they filled the mangers so the horses could pick over the hay and take only the best of it. In our experience we have found that where it was necessary to feed damaged hay to horses the best plan was to feed lightly of the hay and increase the amount of grain enough to make up for the deficiency of hay.

In feeding prairie or good timothy hay where the grain feed is liberal there is not so much danger of horses over eating but even with these hays it is never advisable for horses hard at work to have their stomachs over crowded.

In feeding alfalfa and clover hay it is decidedly better to feed only part of the feed each day of these highly protein feeds and give some prairie or timothy to fill out. But where the other hays can not be obtained we would never feed more than one pound daily of hay for each one hundred pounds of the weight of the animal. That would be ten pounds of hay daily for a thousand pound horse and fifteen pounds for a fifteen hundred pound horse and we would consider this the maximum.

There is always this to bear in mind that there is a great difference in the quality of hay depending upon the stage of ripening when it is harvested and how it is cured etc. Most any variety of hay cut when dead ripe is poor quality. The best time to cut timothy is just as soon as the bloom falls. If cut when in bloom the quality of hay is good except that the bloom makes the hay very dusty. When cut after the seed ripens the hay is woody and less digestible. Clover is best cut when in full bloom and before many of the heads begin to brown. For alfalfa we know of no experiments that have been made but experience of the best farmers has pretty well settled the best time for cutting alfalfa when not more than one-fourth of it is in bloom. But for the good of the plant it is better to cut when the new shoots start well regardless of bloom. Some farmers contend that alfalfa for horses should be cut ripe but if the facts were known definitely we think that this notion might be because when cut ripe the horses will not eat so much of it and there is not so much danger of over feeding.

CANADA FIELD PEAS AND OATS

To The Missouri Farmer:

In reading Mr. W. D. McKee's letter regarding Sheep on Every Farm, in the last issue of your valuable paper, we are so interested in what he says about raising peas and oats, that we would like to ask a few questions. We have 10 acres of timothy meadow that has a thin sod. It is very rolling and has been worn out, down to the clay. We want to know if it will do to break it deep as soon as the hay is cut off, and then sow to rye this fall, and then in the spring turn the rye under and then sow the peas and oats, or will it be to late for them. We know what a benefit it is to the ground to plow rye under as we have followed that for years, but we do not know anything about peas whatever, as there is no one in this vicinity that ever raised any. We are very much interested in this matter and would like to get what information we can, and will be very much obliged to you, or Mr. McKee for what you can tell us.

Deshler Brothers,
Grundy County.

The Canada field pea is very much like the garden pea in its habits of growth and climate and soil requirements. It should be planted pretty deep and preferably in a well-drained, warm soil and as it requires cool weather it should be planted very early. It is grown extensively in Canada and some of our Northern states and ought to do fairly well one season with another if sown early. Mr. McKee's success ought to show what can be done with it if handled properly.

It is perhaps best to seed with a drill because the seed can be planted more evenly and at a uniform depth. It is best to sow with oats, one to two bushels of the peas with about the same amount of oats to the acre. This mixture will furnish good grazing for most any kind of stock and will make a hay equal to our best hays if well cured. In our dry years, particularly, if the early part of the season, May and June, should be very dry and hot, the peas would not do so well.

Your plan of sowing the field to rye is all right for fall and winter pasture but you will get very little growth to plow under in the spring because you will need to plow the ground for peas too early for the rye to have made much growth. I think it would hardly be practicable to try to sow the peas and save the rye because any drill that would put the peas in deep enough would necessiarily destroy most of the rye and then the rye would ripen earlier than the peas.

The rye would make a good winter covering for the land and if sown early, say in August or first part of September, the amount of pasturage in a good season ought to pay well for the seed and labor.

The question of winter cover crops ought to be given more attention than is now given and especially on all our rolling lands. Some farmers find it profitable to sow rye in the corn even where the field is to be planted to corn the following season. By May the rye will have made enough growth to make quite a lot of humus to turn under.

Geo. B. Ellis.

TIMOTHY WITH ALFALFA

Our good friend W. W. Pollock of Adair County writes as follows:

"I have passed the 80-year mark but still go to school. Your talk on 'Fertile Soil' in the June 15 issue pleases me to a T. Now for a little detailed information. On April 10, 1914, I sowed on six acres of clay soil about 90 pounds of alfalfa seed and 50 pounds of clover. The drouth killed most of the clover but the alfalfa is a good stand except in spots. Last fall I manured it well to prevent freezing and the manure seeded it well with timothy, and now timothy is overtopping the alfalfa. Since May 17 excessive rains have prevented cutting (June 28) and it still rains. Now I aim to plow when crop is off and disk and harrow well and then in April 1916 reseed to alfalfa again, without manure. Is my plan right? What fertilizer should I use? I expect to put on a ton or a ton and a half of pulverized limestone. Next time I want clean alfalfa—no clover and timothy."

In the first place let us compliment our friend who says he is still going to school at 80 years of age, and what a fine lesson this should be to those younger men who think they have learned it about all at fifty. Learning at 80! I wish I had time to say more about this fine example of leadership and usefulness. But how will we handle this land? In the first place it might be well to let it stand. just as it is and scatter some more manure over the thin spots and reseed them with alfalfa after a thorough disking. The field could then be treated with the limestone and if it needs more fertilizer two or three hundred pounds of raw bone meal to the acre will be about the best fertilizer to apply. Whatever fertilizer you use get a good brand of high grade goods.

If the alfalfa has a good dark color and shows the little nodules or wart-like growths on the roots, it might pay to let it stand. For pasturage the mixed seeding will be fine and will be good for hay, but, of course, the timothy and alfalfa will not ripen together for the best hay. If, however, the field is pastured lightly you can get two cuttings a year of good hay, the first about the time the timothy is in bloom and the other will be mostly alfalfa. I have seen an alfalfa-timothy mixture handled in this way for several years.

Another plan would be to mow the alfalfa more often which would hold the timothy in check. But if a clean stand of alfalfa is wanted I would plow the land deep right away and work it into a good seed bed and then sow the alfalfa as soon as I got a firm seed bed between now and September 1. This will give the alfalfa a good start of the weeds next spring and at least one more cutting of hay next year than spring sowing. I would put the limestone on after plowing the ground and apply the raw ground bone two or three hundred pounds to the acre and more will do no harm.

If the ground is free from weeds and summer grasses it would be safe to let it go over until next spring for seeding but I can see no possible advantage for doing this unless the ground "heaves" badly. If this is the case, then the alfalfa will get a deeper root before its first winter and will hold better.

In this connection, let me say that Sam Jordan, who has had wide observation with alfalfa, recommends the late fall pasturing and tramping of alfalfa on lands that freeze out badly. He says it will protect it wonderfully from freezing out and it is worthy of trial.

Geo. B. Ellis.

BUCKSHOT BY THE PROFESSOR

It seems to me the whole country has gone "wet."

There's a plumber needed somewhere up in the sky. The clouds have busted their pipes.

The only way a submarine can get me is to come out into my cornfield after me—and then it would get stuck in the mud.

Fighting for your country is alright if there's no other way out of it—but farming is a whole lot healthier occupation and better for the human race.

This is mighty hot weather to be writing stuff like this—and yet most of the fellows who have to read it would swear that it isn't "hot stuff" either.

If you get a chance to stack your wheat, better do it. If you don't then see that the shocks are kept in good condition. Let's try to have No. 2 wheat, if possible.

The average farmer would a whole lot rather discuss the Monroe Doctrine than milk cows—but there's more money in the latter proposition.

We can have too much wet weather just as we can have too much dry weather—but in the long run I'll take a little too much rain every time. It at least means plenty of feed and that means a great deal to the farmer.

And now old "Whiskers" Carranza down in Old Mexico is going to write a "White Book." We've already stood for enough from the greasers and then some—but if they go to writing "War Books" I am in favor of an immediate declaration of war. As the dutchman says, "Enough it too much."

I've got a scheme for "Universal Peace" that's got "Bill" Bryan's skinned a mile. Just make a rule that the kings, emperors, prime ministers and diplomats who start it are to shoulder a gun and do the first fightin'. You wouldn't need any special peace treaties or peace congresses after that. Once you make the fellows who start the trouble get their own "feet wet" first, the peace doves would be thicker than jay-birds.

POTASH *for* WHEAT

Many farmers are anxiously inquiring whether they can secure any Potash in their wheat fertilizer this Fall. From the best information obtainable, it appears that while Potash exports from Germany were entirely stopped last January, there is still some Potash in the country that will be used in the wheat fertilizers. The amount is very much less than usual. Hence those who wish to secure fertilizers containing it, must be alert and place their orders early. Those manufacturers who have it in stock will doubtless make it go as far as possible and the percentage in wheat fertilizers must be lower than in former years. The price per unit will doubtless be higher, but not so high as to make it unprofitable, especially where clover or hay is to follow the wheat.

Inability to secure the usual wheat fertilizers containing from 2 to 6 per cent of Potash should not lead farmers to decide not to use any fertilizer.

The reduction in the sales of cotton fertilizer has left more Potash available for wheat fertilizer than we could have hoped for a few months ago and minor sources of supply have been fully utilized.

There is no substitute for Potash. It is very scarce just now, but POTASH PAYS.

To Get Rid of Fleas

Please let me add a bit of information to your article on fleas that appeared on page 13 of July 1st issue of The Missouri Farmer. We got rid of this pest that nearly worried us to death, by scattering lime in the hog houses and keeping long haired dogs around the house and keeping them peppered with insect powder. The dogs collect the fleas and the powder will do the rest. Keep a few sheep around the place for a short time and the fleas will get entagled in the wool and die without annoyance to the sheep. If you have no sheep just borrow a few of your neighbor. Put grease on dogs and hogs and the fleas will "vamoose."

H. I. Yetley, Elsey, Mo.

Essentials of Agriculture

We have just received from the publishers, Ginn and Company, a new book, "The Essentials of Agriculture," which is all the name implies. The author of the book is President H. J. Waters of the Kansas Agricultural College and formerly dean of the Missouri College of Agriculture and known to most of our readers. The author was assisted by a number of the leading agricultural specialists and teachers and so when you read this book you get the best thought of a half hundred men who supplement the knowledge of the distinguished author.

While the book is written apparently for use in schools every farmer will find it a most valuable book to have on his table and particularly so if there is a boy in the family. This book ought to lay the foundation for good farming for any young farmer who will read it.

Do Your Roofs Leak?

If your house, granary or barn roofs leak, look up the advertisement of the Edwards Mfg. which appears in this issue. They can tell you how to stop the leaks permanently and cheaply. Mention The Missouri Farmer when you write. Your granary should be water-proof if you expect to keep your wheat and oats in good condition.

ME AND ANDY AND JOHN

Me and Andy and John
Are givin' a lot away
To colleges here and libraries there—
Were helpin' 'em every day.
There's John—he's smilin' a happy smile
And writin' the checks against his pile;
And Andy—biddin' the world have peace
And wishin' the wars would somehow cease;
And me—I'm doin' my hours o'toil
To pay the bills for the steel and oil.
John and Andy and me—
We're certainly helpin' some
With money for this and money for that
As fast as petishuns come.
There's Andy makin' 'em carve his name
Upon the libraries for his fame;
And John—he's teachin' the young to save
An' givin' advice he always gave.
And me? I'm helpin' 'em meet both ends
By chippin' in all the dividends.
Andy John and me
Hold wealth as preshus trust;
We're helpin' 'em here an' helpin' 'em there
By shovelin' out our dust.
There's Andy—busy as he can be
Considerin' plans for a library;
And John a-whackin' a boundin' ball
And lettin' his words o'wisdom fall;
And me! I'm payin' my small amount
To help 'em both to a bank account.
Me and Andy and John
Are givin' our money free;
The colleges here and libraries there
Are gittin' it from us three.
There's John—he's happiest when he gives,
And he'll be doin' that while he lives;
And Andy—makin' 'em raise their part
To build the house for books and art.
And me? By ginger! How fine I feel—
Apayin' the bills for oil and steel!

BREAD MAKING—No. IV

Fancy Breads

Breads may be made in a number of ways, that add much to its attractiveness. In this way a pleasing and economical diet may be maintained. None are expensive when compared with meat and with a plentiful supply of vegetables and fruit they make a well balanced diet, which is enjoyed much more on account of its endless variety of breads.

Parker House Rolls

1 cup of milk
1 tablespoon of sugar
1 tablespoon of butter
Flour for dough
1 tablespoon of lard
½ teaspoon of salt
¼ to ½ cake of compressed or dried yeast, or
¼ to ½ cup of liquid yeast

Scald milk, place the yeast in one-fourth cup of luke warm water and add sugar to the water. Measure the butter, lard and salt into a mixing bowl. Add the scalded milk and cool to luke warm; stirring occasionly. Stir yeast water and sugar together and add to milk mixture. Add the flour gradually, beating thoroughly until no more can be worked in with a spoon. Cover tightly and let rise until three times its bulk. Turn on a lightly floured board, knead slightly and roll three fourths inch thick. Cut with a round or oval floured biscuit cutter, crease in the middle with floured knife handle, rub one half with melted butter and fold over. Place one inch apart in an oiled tin and let rise until double in size. Bake in a hot oven 15-20 minutes.

How to glaze Parker House Rolls or Other Fancy Breads—Brush with melted butter or milk and sugar (1 tablespoon of sugar to one fourth cup of milk) before baking. Brush with egg, slightly beaten and diluted with 1 tablespoon of water or milk, when taken from oven and return for a few minutes to glaze the top. The egg yolk or the egg white diluted with water or milk, may be used instead of the whole egg if desired.

When baked and nearly cool, brush over with powdered sugar, moistened with boilng water to spread and flavored.

Cinnamon Rolls

Roll Parker House roll mixture one half inch thick. Spread with melted butter and sprinkle with mixture of 5 parts sugar to one part ground cinnamon. Roll as a jelly roll. Cut in ¾ inch slices. Put closely together in buttered tin, cut side up. Let rise and bake in moderate oven 35 minutes.

Swedish Tea Ring.

Use the receipt for Parker House rolls. When light, put onto an unfloured board and roll as thinly as possible in rectangular shape. Spread with melted butter and sprinkle with chopped blanched almonds, or cinnamon. Roll like a jelly roll, cut a small piece from each end and join the ends to form a ring. Place on a buttered baking sheet, and make cuts one inch apart across the roll with scissors extending almost to the inside. Turn each piece to have the cut side up. Let rise and bake in a moderately hot oven.

Salad or Dinner Rolls

Use the same ingredients as for Parker House rolls. Shape in small biscuits, place in rows on a floured board, cover with cloth and let rise until very light. Flour the handle of a wooden spoon and make deep crease in the middle of each roll, take up and press the edges together. Place closely in a buttered tin. Cover, let rise and bake 12-15 minutes in a hot oven. From this same mixture, crescents, braids, twists, bow knots, clover leaves or shamrocks and other fancy shapes may be made.

Crescents

When the dough is light, roll in a sheet one eighth inch thick and cut in strips about four inches wide; cut these in sharp pointed triangles, then commencing at the base, roll them up, bringing the ends towards each other, keeping the point in the middle of the roll to give the shape of a crescent. Place them in baking tins some distance apart. When light, bake 15-20 minutes.

Braids

When the dough is light, roll in a sheet one fourth inch thick, cut in strips one half inch wide, then braid them in three or four strands having the braids wider in the center than at the ends. Let rise and bake.

Clover Leaves or Shamrocks

Oil a muffin tin. Take small bits of dough, knead until smooth, shape in balls and fit three in each tin. Let rise and bake.

Bread Sticks

Use the same ingredients as for Parker House rolls, with addition of one egg white. When ready to shape form in small balls, then roll on an unfloured board with the hands until strips are formed uniform in size and the shape of a thick lead pencil Place on a baking sheet or pan some distance apart, or in a tin designed for the purpose. Bake, when light in a hot oven, reducing the heat that the sticks may be crisp and dry.

For salad sticks—Additional salt may be added to the dough and the sticks sprinkled with salt before baking.

Zweiback

Use the receipe of Parker House rolls with the addition of one tablespoon of sugar, 1 tablespoon of butter and one egg. Scald the milk and when lukewarm add the yeast. As soon as the yeast is dissolved, add the salt and one-half cup of flour. Cover and let rise until light, then add sugar the butter, the eggs unbeaten, with flour enough to handle. Knead, shape and place in tin. Let rise, and bake in a hot oven about 30 to 40 minutes. When cold, cut in slices about one half inch thick and dry in a slow oven until delicately browned.

PREPARATION OF FRUITS FOR CANNING

When preparing fruit for canning, ripe fruit, on account of the richness of flavor, is usually preferred to green but it should not be over ripe. Over ripe fruit can be used for jams, marmalades and preserves. Some fruit like pears may be picked before they are ripe and allowed to ripen off the tree, but peaches and similar fruits are best picked ripe and canned immediately. In canning small fruits it is well to remember that those picked in the earlier part of the season contain fewer seeds than the later berries. In preparation of fruit for canning it should first be picked over and all stems, leaves, dirt or spoiled fruit thrown away. In picking over the fruit may be separated into lots according to size, ripeness or purpose desired. The next step in the process is to clean the fruit to be used. The smaller fruits may be put into a colander or sieve and a stream of water poured through it. When clean it is ready to cook if it is the kind that does not need to be peeled and cut up. If cut up the pieces should be of a uniform size, as it gives a better appearance in the can.

Fruits, and especially the smaller fruits, as berries, cherries, etc., do not require as much heating in order to be perfectly sterilized because the type of bacteria found does not require as high a temperature in order to be killed as to those found in the less acid fruits and vegetables. Forty minutes heating in the steamer for one day is enough time for this kind of fruit.

In order that there be as little wasted space in the jar as possible, the jar should be closely packed with fruit. If sugar is used in the jar with the fruit instead of syrup, less space is wasted and no water is added. Enough sugar should be added to improve flavor. The fruit may be prepared and placed in the sterile jar, alternating a layer of fruit with a layer of sugar and packing as closely as possible without crushing. The jar is then placed in the steamer and steamed for forty minutes with the lid on loosely. The rubber may be placed on during the last few minutes of steaming and the lid screwed down.

Raspberries, Red or Black.—Raspberries are liable to contain small worms and must therefore be examined carefully. This fruit spoils very quickly and should be canned as quickly as possible after picking. They loose their juice and shape, so great care should be taken in washing them. They should not be allowed to stand in water but should be washed gently and drained.

After preparing, place in sterile can with alternate layers of sugar and fruit. Pack the can as tightly and full as possible without crushing the berries. Steam in boiler 45 minutes for one day only.

Currants.—Currants should be handled carefully and preserved as soon as possible after picking. They may be canned with or without sugar. They contain so much acid, that little heat is required to preserve them. Currants are especially good for jelly making; both alone and in combination with other fruits.

To Preserve Currants.—They are especially good as a meat relish. Put equal amounts of currants and sugar upon a platter and crush each berry. Place in sterilized jars and seal. They will keep perfectly if every single berry has been crushed.

Peaches.—Use firm solid fruit not too ripe. The riper peaches may be made into preserves and butters. Peel, cut in halves, remove pits, unless to be canned whole. Place in sterile jars with rubber in place, cover with thin hot syrup. The covers are screwed on loosely. Place jars in steamer and boil from 15 to 20 minutes depending on ripeness of peaches. Lids are tightened upon removing from boiler.

Plums.—Select firm ripe fruit, wash in clean water. Remove steams and trash. Remove seeds or not, as desired. If not seeded, small holes pricked in the skin of the fruit will prevent it from bursting. Place in jars and cover with a thin hot syrup. Place lid on loosely and place in boiler and sterilize for 45 minutes. Plums may be canned by washing and pricking to prevent bursting. Add the plums to the syrup, (1 cup of sugar to 2 cups of water) cook until tender and place in sterilized jar with sterilized rubber in place. Fill the jar to overflowing with the hot syrup. Put on sterilized top and screw down tightly.

String Beans.—Select young and freshly gathered pods. Remove all strings. They may be canned whole or broken into uniform lengths. Place in a clean sack or wire basket and place in boiling water until tender. Drain and after cooling slightly, pack in sterile jars, fill jar with sterile water and add 1 teaspoon of salt to each quart. Steam one hour in boiler, adding rubber and tightening lid during last fifteen minutes of cooking.

Sweet Corn (off cob).—Dip in boiling water ten to fifteen minutes according to ripeness, size and freshness, plunge quickly in cold water. Cut corn from cob and pack tightly in sterile jar. Add boiling water and 1 teaspoon of salt to each pint. Place lid on loosely and steam in boiler for one hour a day for three successive days. If the weather is warm and fermentation is liable to take place between steaming periods,the time may be shortened; for instance, steam one hour beginning at 6 o'clock in the morning and repeat the process at 6 o'clock at night. Then give the next steaming early on the following morning; placing sterile rubber and tightening lid for last steaming.

Young Beets.—Beets are considered quite difficult to can on account of loosing the attractive red color the fresh beet possesses. The loss of color does not affect its value or its flavor. However, this may be avoided if the glass jars are stored in the dark. Beets should not be canned in tin. Young tender blood red varieties are best. Boil in an open vessel until peeling comes off easily. Peel, slice, quarter or can whole as desired. Fill jars full and add fresh cold water; one to two teaspoons of sugar may be added if desired. Place tops on loosely and steam in boiler for one hour each day for three successive days as given under "peas."

Tomatoes.—Tomatoes should be assorted into three divisions: the perfect ones for canning whole, the less perfect ones to be cut into pieces and canned and the inferior ones (but not rotten) to be stewed and the juice used for filling cans.

To can whole tomatoes scald them, then dip in cold water and remove the skin. This operation is easier if the tomatoes are placed on a square of cheese cloth. Bring the corners together and fasten them. This makes a convenient bag to lift them in and out of the water. Pack the cans as full as possible. One teaspoonful of salt to each quart of tomato juice which has been strained should be used to pour over the tomatoes when they are put into the can. Water should not be added as it decreases the food value and the flavor.

In case jars with screw tops are used, adjust the rubber and screw the top on just tight enough so that you can lift the jar by the cover. Do not screw the top on so tight as to prevent the the escape of air. Place the cans in a wash boiler or other large utensil, using a rack (a wooden or metal frame) then add water until it reaches within three inches of the top of the outside of the can. Cook for fifteen minutes after the water begins to boil. In case of very large tomatoes the time of cooking should be longer as it takes heat longer to penetrate into the center. In refilling the boiler, unless the jars are sufficiently hot from sterilization to prevent cracking them, they should be put in cold water. Remove the cans when they have been heated the length of time stated above and tighten the cover. In canning tomatoes which have been cut in pieces proceed the same as above. The juice that is added in this case need not be strained.

University of Missouri.

THE FARM WATER SUPPLY

There is more poetry than pleasure in "Carrying water from the spring," or any other source of supply, when face to face with the proposition of carrying enough of it for the family washing, the Saturday cleaning and scrubbing, and incidentally, the Saturday night bath supply. With dishes to wash three times a day or more, cream separator to clean, vegetables to wash, cooking, and the hundred and one other demands for water in the daily routine of the home, is it surprising that the housewife seems always to see empty water pails before her. A call on Johnnie or Willie brings the invariable complaint, "Didn't I jest get a pail-ful?"—it may have been a couple of hours ago and Mother may have carried in a dozen pail-fuls herself in the meantime to avoid delay. And if Father carries in an occasional pail or two, it is with a half-conscious air of having done his duty as a considerate head of the house.

This is a day of labor-saving devices, and there is nothing which will save more labor and give greater satisfaction to the country housewife and at the same time add so greatly to the comfort of the entire family as a home waterworks system.

There are thousands of farm homes where such systems have been installed, and there are thousands more where they no doubt would be adopted were it not that the idea has never taken practical form in the farmer's mind. If it ever did suggest itself it was as a sort of "pipe dream," and with the putting away of the pipe was dismissed as impracticable or altogether too expensive a proposition to be considered seriously.

A home waterworks equipment is not impracticable for any ordinary farm or village home, and the average farm owner on looking into the subject a little would no doubt be surprised to find at what comparatively light cost such comfort and saving of labor can be accomplished.

Especially is this the case where there is already a gasoline engine on the farm to do the pumping—and there are few farms of any size or pretension nowadays that do not have one of these engines. Even if an engine must be purchased primarily as a part of the house waterworks equipment, its cost cannot rightly be charged up wholly as a part of the expense for this purpose, as it is used

for so many other purposes—sawing wood, cutting and grinding feed, spraying, turning the grindstone, operating the fanning mill, cream separator, churn, washing machine, and every other machine to which power can be applied. Conceding, therefore, that almost every farm either has or will have its engine for general purposes, the cost of an engine is hardly to be considered as a part of the cost of putting in a waterworks system.

There are three methods by which a farm or village home that is out of reach of a city waterworks system can be equipped with running water:

1. By gravity from a well or spring on higher ground;
2. By gravity from elevated tanks;
3. By means of a pneumatic tank.

The first method requires conditions rarely found. It depends on having an elevated spring or water source near at hand, from which water can be piped down hill with pipes run into the house up to a height corresponding to the source on the hill. Obeying the natural law that makes water seek its own level, the water will rise in the pipes as high as the level from which it has been secured, and can thus be distributed throughout the house. With this system no pumping whatever is required. This is an ideal method, but the necessary conditions are not often found.

Gravity flow by means of an elevated tank is a system quite commonly used. The tank is often placed in the attic of the house, or in the hay mow, or it may be placed on a tower in the open yard. The use of the tower, however, is apt to be unsatisfactory, except where the climate is mild enough so that the water will not freeze. Where the tank is placed in the attic, danger from freezing is largely avoided by running the supply pipe along the inner wall of the house; when a tank is located in the hay mow, the pumps are in the stable and the supply pipes are run under ground to the house. As to the size of tank, a 500-gallon capacity should be large enough for a medium-sized farm, for both family and stock. Such a tank could be filled daily by running the gasoline engine from five to ten minutes at practically no cost for fuel. A 500-gallon tank in either galvanized steel or cypress can be bought for about $10 or $12. If only a house supply, to be located in the attic, is desired, a 150 to 200-gallon size might be large enough and even more desirable, as too great a weight would not be practicable in such a location. One of these smaller tanks could be purchased for about $5. A 1,000 to 2,000 gallon tank would cost from $15 to $25, but with a tank of that size, located so as to avoid trouble in cold weather, a half hour's pumping with a gasoline engine a couple of times a week would furnish water for every possible use on the farm—for both family and stock, and for watering the flowering shrubs, fruit bushes, and the family garden in dry weather—by merely turning a faucet or two. It certainly sounds attractive, doesn't it?

The pneumatic tank system of supplying water for the home, is unquestionably the best and most satisfactory system that has yet been devised, though perhaps costing a little more in the beginning than the elevated tank gravity method. The outfit consists of an air-tight steel tank, a force pump, and piping to connect well to pump, pump to tank, and tank to house pipes. The tank is usually placed in the cellar, or is buried under ground and the pump may be located at the well, in the cellar, or wherever convenient.

The principle on which the pneumatic system is based is air pressure. Water is pumped into the air-tight tank and compresses the air in the tank which exerts a proportionate pressure on the water, forcing it upward in the pipes to the desired height. Some of the advantages are that, owing to the location of the tank in the cellar or under ground, the water is kept cool in summer and does not freeze in winter; also the air in the tank by oxidizing organic matter in the water, purifies the water to a considerable extent.

Any form of power can be used to do the pumping for pneumatic system—hand power, windmill, gasoline engine, hot air engine, electric motor, etc. It is a safe guess, however, that any one who is interested enough in labor saving to install a water system is not going to do the pumping by hand and is not going to require expensive hired labor do it. Windmill power requires a tank large enough to hold at least a three days' supply; otherwise lack of wind may keep the water system out of commission a good share of the time. In some cases the electric motor, hydraulic ram, or other special forms of power may be the most practical but for the average farm, for average conditions, gasoline engine power gives by far the best all-round satisfaction. As a pumping engine and all-round source of power for the farm work, the gasoline engine has many advantages. It does not require the services of a trained engineer. Any man of ordinary intelligence can learn to run it in less than a day. It is light in weight and can be easily moved from one place to another as the work requires. It can be started in a few seconds and will run all day without any attention whatever. It cannot possibly blow up and there is no danger of fire. It is cheaper than hand labor—if a pint of gasoline costing two cents can be made to do the work it takes a man eight hours to do, the gasoline should be made to do it.

With these facts in mind, no farmer needs to be afraid to invest in a good gasoline engine, if necessary, to do his pumping. If he gets a good one, he will get his full money's worth aside from the pumping proposition, and, with power furnished, the rest of the expenses for a water system will not be especially heavy.

The purpose of this article has not been to give detailed information as to how to install a farm water system, but rather to awaken interest in the subject and direct attention to its practical possibilities.

E. G. Norton, I. H. C. Service Bureau.

FEED HENS A BALANCED RATION

One of the factors which determine egg production is the feed ration, not merely the quantity of feed given, but the elements contained therein.

Many questions are asked as to what a balanced ration for egg production is, and how to balance the ration.

In order to determine more fully the effect of certain rations, a number of experiments are in progress at this station. Each pen contains twenty hens.

The test with a wide ration, containing elements which would produce three yolks for each white, laid 379 eggs in the first six months.

The test with a narrow ration, containing elements which would produce two whites to each yolk, produced 269 eggs.

The test with a ration containing equal yolk and white material but without minerals to produce the shell, produced 161 eggs.

The test where the ration contained elements necessary to produce equally all parts of the egg, produced 1603 eggs in the same time. This ration is called a **balanced** ration for egg production.

The yolk is principally carbohydrates; the white, protein, and the shell, minerals. Thus the three parts of the egg are made from three kinds of food.

The following ration is fairly well balanced for egg production. Instead of using the terms carbohydrates and protein, the terms "yolks" and "whites" have been used. All fractions are omitted, therefore the table is only approximately correct.

Grain		Yolks	Whites
Cracked corn	150 lbs.	382	198
Wheat	150 lbs.	365	273
Mash			
Wheat bran	20 lbs.	31	41
Middlings	20 lbs.	41	44
Corn meal	20 lbs.	52	27
Ground oats	20 lbs.	39	31
Gluten meal	20 lbs.	46	86
Beef scraps	30 lbs.	32	332
Alfalfa meal	5 lbs.	7	9
O P Oil meal	5 lbs.	8	25
	440 lbs.	1003	1066

The hens had access to oyster shell and grit, and were given two pounds of fine table salt and four pounds of fine charcoal in the above mash.

The basis for computing the number of yolks and whites produced by each kind of feed was that one pound of carbohydrates would produce 3⅓ yolks; one pound of protein would produce 16 2-3 whites, this being the rate of the average hen here at the Station.

It will be seen that from 150 lbs. of corn, 382 yolks and 198 whites are produced, therefore, it is not a balanced ration. The extra yolks are built into fat. In this way, hens fed on corn alone get extra fat, and we hear the old expression that the "hen is too fat to lay." The expression should be changed to read, "the hen can't lay is the reason she gets too fat."

A simple ration may be made as follows:

	Yolks	Whites
150 lbs. cracked corn	382	198
150 lbs. wheat	365	273
25 lbs. beef scraps	25	275
Totals	772	746

This ration would give best results where the hens have free range, because it contains no mash, thus requiring the hen to do the grinding of the food. The kind of food she gets on the range should be considered, however.

If a hen has the ability to produce 24 eggs in one month when fed a balanced ration, but is fed an unbalanced ration like corn alone, which produced two yolks for each white, instead of making 48 yolks in order to produce 24 eggs, she makes only the 24 yolks, but can complete only twelve eggs. The same thing is true of the whites. It is the same proposition of "no chain being stronger than its weakest link." No hen will lay more eggs than the weakest part of the feed ration.

All hens in the Missouri Contest, good and bad, averaged more than 50 per cent egg yield during June, and have averaged 108 eggs each for eight months. The average for June was approximately 16 eggs per hen, being one egg less on the average than in May.

Three Plymouth Rock hens are still in the lead. The ten highest pens for eight months are as follows:

Pen No.	Eggs
34 Barred Rocks	715
40 Barred Rocks	701
38 White Rocks	685
6 S. C. White Leghorns	671
2 S. C. White Leghorns	666
10 S. C. White Leghorns	653
26 Buff Wyandottes	644
4 S. C. White Leghorns	635
14 S. C. White Leghorns	634
0 S. C. White Leghorns	632

The five highest pens for June laid approximately seven eggs less each in June than in May, which is partly accounted for by May having 31 days and June only 30.

The five highest pens for June are as follows:

Pen No.	Eggs
6 S. C. White Leghorns	115
2 S. C. White Leghorns	110
0 S. C. White Leghorns	110
10 S. C. White Leghorns	106
9 S. C. White Leghorns	106

Of the five highest hens for eight months, two are Leghorns, two are Rocks, and a Wyandotte and Rhode Island Red tie for fifth place.

C. T. Patterson.
Missouri State Poultry Association, Mountain Grove, Mo.

HENS FED BEEF SCRAPS LAY MANY MORE EGGS

That it is a poor policy for farmers not to feed some kind of food to their chickens which is high in protein value—such as beef scraps or sour milk—is the opinion of H. L. Kempster, associate professor of poultry husbandry at the University of Missouri.

Mr. Kempster has recently conducted an experiment which he believes proves conclusively that protein food produces greater results at lower costs.

In three separate pens the same number of chickens were kept. All were fed corn all of the time, wheat part of the time, and in addition ground grain rations of bran, middlings, and corn meal. Besides this regular feed for the chickens in all three pens, those in pen one were fed beef scraps, and those in pen three were given all the sour milk they wanted. The hens were about the same age. The experiment covered the time between November 1 and June 1.

Those hens in pen two—given only the regular feed—produced only 800 eggs; those in pen one—given beef scraps—produced 1518 eggs, and those in pen three—fed sour milk—produced 1425 eggs. The hens in pen one ate 923 pounds of grain, those in pen two 944 pounds and those in pen three 836 pounds.

The amount of beef scraps fed to the chickens in pen one was 60 pounds, costing $1.80. These hens produced 718 more eggs than those chickens fed only the regular ration. In other words, these chickens produced 718 additional eggs on feed which cost but $1.80 more than the regular ration. Those hens fed sour milk produced nearly as many eggs as those fed the beef scrap ration.

LONG AGO

I once knew all the birds that came
And nested in our orchard trees;
For every flower I had a name—
My friends were woodchucks, toads, and bees;
I knew where thrived in yonder glen
What plants would soothe a stone-bruised toe—
Oh, I was very learned then;
But that was very long ago!

I knew the spot upon the hill
Where checkerberries could be found,
I knew the rushes near the mill
Where pickerel lay that weighed a pound!
I knew the wood—the very tree
Where lived the poaching, saucy crow,
And all the woods and crows knew me—
But that was very long ago.

And pining for the joys of youth,
I tread the old familiar spot
Only to learn this solemn truth:
I have forgotten, am forgot.
Yet here's this youngster at my knee
Knows all the things I used to know;
To think I once was wise as he—
But that was very long ago.

I know it's folly to complain
Of whatsoe'er the Fates decree;
Yet were wishes all in vain,
I tell you what my wish should be:
I'd wish to be a boy again,
Back with the friends I used to know;
For I was, oh! so happy then—
But that was very long ago.

EUGENE FIELD

WHY NOT INCREASE THE PRODUCTION OF YOUR COWS?

It is generally agreed that natural conditions in Missouri are most favorable to dairying, and if our farmers will take full advantage of the opportunities offered, we can expect to see Missouri one of the leading dairy states of the Union. Our mild climate enables us to grow forage crops in plenty, and allows our stock to graze more months in the year than our northern dairy states. With our natural resources at hand, and not producing the amount of dairy products equal to some of our neighbor states, not so favorably located, it would indicate that we are either short on dairy cattle, or our farmers are not giving sufficient attention to the industry.

According to figures based on the federal census of 1910, Missouri has 856,000 dairy cows. If our cows produce only the average amount of butter fat credited to the average cow, by the dairy department at Washington (that is about 150 pounds of butter fat per year, per cow) our average is too small, and we should strive to increase our average output through better breeding, better care, more feed, raising the heifers from our best cows, and more careful selection of additional cows to our herds. The Babcock test and the milk scales should be employed and the unprofitable cow should be disposed of and their places should be filled with cattle that are better bred and can show a profit.

When we consider that Denmark is the most successful dairy country we have, and that they started to specialize in dairying less than thirty years ago, and built up their dairy herds from beef breeds of cattle, and are now producing an average of 250 pounds of butter fat per cow per year, and that there are more than thirty cows in this country that have over 1000 pounds of butter in a year to their credit, and there are entire herds averaging over 400 pounds of butter fat per cow per year, it would seem that to materially increase our average cow's output would be well within the range of possibilities, and to know that for each 5 pounds of butter fat added to our Missouri owned cows would mean more than one million dollars annually added to the wealth of those who are milking cows, should make the effort well worthy of our careful consideration. In order to get the most out of any business, one must specialize in the work, and when all our farmers realize that it does pay to apply business principles to dairying, and practice it, their profits will surely increase.

Jasper County is among our best dairy counties in the state. About twenty years ago the creamery promoter induced a number of farmers and business men to build a creamery in Carthage. Like many other creameries built in Missouri in those days, it failed, on account of not having sufficient number of cows to support it. The failure retarded the progress of the industry in the community, and the effect of these failures over the state have been far reaching in creating a suspicion that dairying is not all that is claimed for it. Only a few have taken pains to ascertain the cause of the failures. If they had investigated they would have found poor management and lack of cows the reason for the creamery closing down. The creamery promoter is only interested in selling equipment and erecting buildings at exhorbitant prices and cares nothing as to the future welfare of the enterprise.

The creamery business was profitable twenty years ago and is profitable today. The same can be said of the dairy business. But it is necessary to apply good business principles to both to be successful. Four years ago another creamery was started in Carthage. Many of the older inhabitants predicted another failure, but those who were behind the enterprise had gone over the territory adjacent to Carthage, and got the signatures of sufficient number of farmers to insure the product from six to seven hundred cows. Last year this creamery paid to its farmer patrons in the community, $87,000. While it has been most successful from the start, lack of sufficient cows or poor management would cause a failure the same as it did twenty years ago.

In the most successful dairy sections of this and other counties, the dairymen are organized and co-operate extensively in all that has to do with their work. They have co-operative creameries and cheese factories, owned and operated by the patrons of the plant, thus getting all the profits of the business, which means five or six cents more per pound, for their butter fat, than they would receive if sold to private factories.

About a year ago the Jasper County Dairy Association was started with ten members. The object in organizing this association was to establish cordial relations and co-operation between the members and enable them to practice such methods as would insure the most successful and economical results. It was desired to encourage the breeding of better dairy stock, with due regard for both type and productiveness, and to promulgate ways and means necessary to obtain these results. It is hoped to have its members realize the importance of frequent meetings, where friendly discussions on all subjects pertaining to the dairy industry could and should take place.

The organization was intended to be purely benevolent and educational in its object, without financial benefit or profit to the association or anyone connected with it. Organization for the accomplishment of a specific purpose specially concentrates and directs energy toward that end. It tends to harmonize and center the minds of men on one project, which, if feasible, is sooner or later accomplished.

What Community Dairy Organizations Can Accomplish

1. Co-operative public sales of surplus stock and private sales through co-operative advertising. The buyers and sellers in communities are brought together through the influences of the association.
2. Co-operative buying of many kinds of feed can be indulged in at a great saving to the members.
3. Exchange of bulls—Many bulls are sold to butchers when their owners are through with them, which through the development of their offspring would have proven to be most valuable breeding animals for years to come.
4. Enables members to obtain the highest possible prices for their dairy products.
5. It enables them to know how to better care for and feed their cows and manage their herds, thereby making an increased profit.
6. It enables them to become better judges of and to quickly recognize the essential points of good dairy stock.
7. Through frequent association of its members, a keener interest in the work is aroused and problems that would ordinarily be difficult are easily solved.
8. It shows the importance of not treating all cows alike, but through special study of each cow, as regards her feeding and temperament, the profits are increased.
9. Through testing cows, the profitable ones, both for utility and breeding purposes, are easily determined.
10. Testing cows show that many cows considered only average, are really the best in the herd.
11. Testing shows that many cows considered the highest in test, are really the lowest.
12. Testing saves good cows from being sold to the butcher, at the same time shows the owner the ones the other fellow should have. Good cows are sure to be profitable when actual yield and cost of feed are considered.
13. Testing brings to notice the slightest variation in milk flow and urges one to seek the cause of it.
14. Organizations develop the faculty of observation and induce reading and study, so that association members are becoming far better dairymen.
15. There is emphasis on the importance of liberally feeding succulent, digestible food; of kind treatment, and of protection from cold, stormy weather, and of paying particular attention to cleanliness, light and ventilation in the stable.
16. Much valuable information can be obtained through these organizations as regards breeding. Discussion brings out ideas as to the most fashionable and profitable blood lines in all breeds of dairy cattle.
17. Any subject pertaining to farm affairs or any kind of stock can be taken up and fully discussed at meetings of the association.

The first thing done of advantage to its members was the buying of several carloads of alfalfa hay, saving $1.50 per ton. This was followed with buying several carloads of corn, at considerable saving. Several thousand bushels of seed oats were bought, also, binding twine, cotton seed meal, and silos, were bought in a co-operative way. In every instance these orders were placed with local dealers. The secretary of the association had outside prices as a guide, but one of the principles of the association is to buy everything of home dealers possible.

Several members combining their orders, enables them to get quantity prices which always means a saving. Frequent meetings of the association brought out the importance of producing raw material of good quality, and better prices resulted. Our members realize that it pays to give the cow more and better feed, and good care. In fact, every member feels that the association has had much to do with developing the dairy industry in this community to its present high standard, and every object the association was organized for has been realized. The membership now numbers over one hundred, and new members join at every meeting.

On Monday, March 29th, the first annual sale of the Jasper County Dairy Association was held in Carthage, Mo. This sale was under the direction of the association and the offering of stock was the surplus of its members, consisting of over fifty head of pure-bred registered Jerseys and several high grades were sold. This was the first dairy association sale ever held in Missouri.

The Jasper County Dairy Association was organized under the direction of the State Dairy Department. There are several other active dairy associations. Any county in Missouri can accomplish what Jasper County has in this work, with a little effort, and the Dairy Commissioner will gladly assist in effecting organizations of this kind, if called upon.

E. G. Bennett,
Missouri State Dairy Commissioner.

ABOUT ALFALFA

Editor Missouri Farmer:

There has been so much written and said about alfalfa, and so many opinions, or ideas, advanced and so much of it cross-fire, that in writing a line on the subject we feel like we were treading on "holy ground" when we set forth, not theories, but facts as we have worked them out on our own farm.

The writer has noticed one peculiar feature in the articles that are written on the subject of late is that the writers, mostly, have been men of but a few years experience in alfalfa culture, and with a short trial imagine that they know all there is to learn about it then rush into print to tell "the only way" that it can be grown. One man has manured his land putting on ten or fifteen tons of manure to the acre and made a success out of it, another man put on a thousand pounds of bone meal per acre and he made a success out of his way, and each one had the only way, and if you tried it any other way you were sure to fail. Up jumps another fellow and he says neither of them knows what they are talking about, that you can't grow it unless you put a thousand pounds of lime on each acre and you need not try to grow it on poor gravelly land but it must be on the richest land on the farm for if it was sown on poor land the weeds would take it but on rich land the alfalfa would outgrow the weeds, etc.

The writer has made the assertion, in dozens of institutes, that it will grow on any land that will produce red clover and that the farmer can get more off his poor hill land by sowing it to alfalfa than any other crop that he can put on it, and he can do this without a thousand pounds of lime or a thousand pounds of bone meal or fifteen or twenty tons of barnyard manure spread to the acre. On my farm there is a rocky elevation that is too rocky to plow. Thirteen years ago it was sown in alfalfa and got a good "catch" and has been kept in alfalfa continuously ever since, has never had a pound of fertilizer on it except what the teams put there in their work taking care of the hay, and this piece has been cut four times each year, and it yields an average of three tons to the acre each season—not each cutting but each season. This land would not produce ten bushels of corn to the acre one season with another, and, I might state further that within three to five feet of the top of the ground is a ridge of limestone rock which knocks the theory of the roots going down to water. Speaking of water, let me say that the alfalfa plant will come nearer growing without any water than any forage plant that the American farmer has ever cultivated and the dryer the weather the better it grows for me. It is true that it must have moisture enough to make soil soup out of the plant food, but it has the power to draw that moisture from the air as it draws the nitrogen from the air. The old theory that its roots must go to water has been exploded long ago—we may have something more to say about that water-root problem later on.

Now brother farmer, let us quit talking about having to use so much lime and so much bone meal and so much manure, etc., before you can grow alfalfa and go at it in a common sense, business manner just like we do at our other farming and we will grow hundreds of tons where we are growing none now. There is only one pre-requisite and that is inoculation with the suitable bacteria, a thing that is very easily accomplished. I think that almost every farmer understands that by getting some dirt from an old alfalfa field or by the road-side where sweet clover is growing, and sowing about one hundred pounds to the acre at the time of seeding and harrowing it in letting just as little sunlight on it as possible as the bright sunlight kills the bacteria that he can inoculate his alfalfa land.

Sow from 16 to 20 pounds of seed per acre, on a well prepared seed bed, from the middle of August to the middle of September and you will be astonished at the amount of hay you will get the next year. Try it and see.

Geo. W. Williams,
Humansville, Mo.

Editorial Comment: Mr. Williams was a pioneer alfalfa grower in his part of the state and has been growing alfalfa for twenty years. In his section of the state there is usually plenty of lime in the soil and the drainage is good and hence his success without lime. But there is a great deal of land in Missouri that lacks lime and on such land it is a waste of time and money to try to grow alfalfa without correcting the acidity of the soil by putting on lime. There is plenty of such land in Northeast Missouri and on the prairies of Western Missouri, and scores of trials have been made demonstrating the value of lime. All soils are not alike and do not require the same treatment, and it will not do to draw a general conclusion from the treatment of any one type of soil. The wonder is, however, that the thousands of acres of Ozark flint hill land similar to Mr. Williams' alfalfa land and so well adapted to this crop as Mr. Williams proves, are not utilized for this purpose. Alfalfa would increase the value of these lands two or three times. Mr. Williams ought to be employed by the state as alfalfa demonstrator for the Ozarks.

SAVING THE APPLE TREES

No one thing has caused so much loss to apple growers as the round-headed apple-tree borer, but a little attention to the trees at the right time will reduce this loss so that at least it is not a menace to the industry. The methods recommended by the U. S. Department of Agriculture that have proved effective are worming and painting the trees with a heavy coat of some paint that will not injure the trees.

The round-headed apple-tree borer, the most destructive of a number of similar pests, lays its eggs in or under the bark of apple trees. After hatching the larvae feed upon the inner bark and wood to such an extent that the tree is seriously weakened or killed. The pest is found over the whole of the eastern portion of the United States and as far west as Nebraska, Kansas and New Mexico. In addition to fruit trees, it feeds on service, wild crab and mountain ash trees, which makes it advisable for orchardists to remove these varieties

for a distance of at least a hundred yards from their orchard.

The female lays her eggs, one at a time, in an incision she has made in the bark, usually just above the surface of the ground. About 15 or 20 days later the eggs hatch and the larvae appear. When full grown these are nearly an inch and a half in length. They first attack the inner bark, eating out broad, more or less circular galleries and thrusting out through small holes in the bark castings which form little heaps of reddish wood fragments around the base of the tree. During the winter the borers are quiescent but early in the following spring they attack the solid wood, while some of them work their way up the trunk. These last spend one more winter in the tree and then, having passed through the pupa stage, dig their way out and emerge as adult beetles. Three years are required for the insect to complete its development from egg to adult.

Ordinarily, the beetle lives about 40 or 50 days. It is about three-fourths of an inch in length, light brown in color above, with two broad white bands, joined in front, extending the full length of the back; the underparts and front of the head are white. The females rarely fly any considerable distance, so that if the immediate vicinity of an orchard can be kept free from them, there is little danger of a serious infestation.

The most common method of ridding an orchard of these pests is to cut away the bark sufficiently to trace the burrows made by the borer. A hooked wire is then inserted into the burrow and the insect pulled out. If made with care, the wound in the tree caused by this process will heal readily. The castings at the base of the tree serve as an indication of the presence of the borers. Where the burrows are curved or obstructed in some way so that the wire can not be inserted, cotton batting dipped in carbon bisulphid should be inserted and the hole then plugged with moist earth. The gas from the carbon bisulphid will penetrate all parts of the burrow and kill the borer.

In addition to worming, as this process is called, paint is often used to prevent the beetles laying their eggs. Pure white lead and raw linseed oil, mixed rather thick, will not injure the trees, and when applied to young, smooth bark, will form a protective coat during the egg-laying season. It is probable that this is a more effective method than wrapping the trees with building paper, cotton batting, cloth or other materials sometimes used for this purpose. Before painting, however, the earth should be removed from the base of the tree for a depth of from 3 to 4 inches. The surface of the trunk thus exposed should be first scraped and painted and the earth then replaced. This is necessary, for the beetle occasionally lays her eggs under instead of above the ground. Our readers can get further information by writing the U. S. Department of Agriculture, Washington, D. C., for Farmers Bulletin No. 675, which treats of this subject very completely.

A RAINY DAY WITH LAUGHLIN

It is on the farm only that each year is so different from others in drouth or flood and this makes it impossible to find the easy way or the one-way of doing things. It is hard to get a general rule to fit all conditions as we used to learn in our old school books. And so we call farming an art rather than a science. Many artists see hard times and so it is with the unfertile minded farmer.

Looking ahead with shaded eyes I see lots of timothy seed in sight this fall. Let me suggest to my brother farmers that we use plenty of seed this fall about September 15 and again give the land a Christmas gift this year, only delay the covering of seed 30 or 40 days, that is until February 1 to 15. Hay has been and will be a good price and then the season's work is distributed much better than if all the land is in one crop. Then again we have another way in wet seasons to get out of dilemmas.

The blues or hysteria is a bad disease. They used to say it drove a man to drink. But with me I have become addicted to the use of gasoline. I don't believe it induces snakes but rather sound sleep.

Some years ago The Missouri Farmer printed a paragraph "Old Bill" which was copied in many papers outside of Missouri. No, we have not cholorformed "Old Bill" but his teeth were dressed and we don't expect 8 or 10 miles in an hour from him but only slow work about the farm. In fact he is on the pasture which he enjoys—I fear too much this wet year for our good profit.

The Missouri Farmer has stood for more than bread-alone farming—it has stood for buttered bread which means pleasures along with economy. This then makes us jump into the automobile controversy which I hinted at in the paragraph before and inspired the "Old Bill" story.

Our light car goes most every day. In fact, we use it as a saddle horse over the farm. The telephone was a sort of a joke when we first got it. The R. F. D. also. Now we find them necessities and out of the line of extravagances. The motor has passed the joke on this farm and is a serious economic proposition.

Let us compare them with "Old Bill."

"Old Bill" at 4 years old	$150
Buggy and harness	100
Feed, one year	70
Investment	$320
Interest at 8 per cent	$25.60
Depreciation, 8 per cent	25.60
Up-keep	10.00
Feed	70.00
Annual cost of "Old Bill" and buggy	$131.20

I believe 2000 miles driving a year is the limit of a horse and buggy, which makes 6½c actual cost per mile. I have three cars in mind in our neighborhood, all three light, 1600-lbs. cars, and the account stands about thus:

Investment	$500
Interest at 8 per cent	40
Depreciation, 8 per cent	40
Up-keep	50
Gasoline	20
Annual cost of Gasoline Car	$150

I think 4000 miles is about the run of a year with the above expense or 3¾c per mile. A 2500-lb. car has been proportionately heavier expense counting on the 8 per cent basis.

These three cars in mind are slow driven cars, from 10 to 20 miles an hour, and over limestone ledges as we have them in Bates County. Faster driving with car or horse will cost more as well as runaways or smash-ups.

So to make this story close properly will say we wished a cultivator iron fixed. The team was tied to the fence and the shop visited and at work in one hour. Just now our Mrs. is picking about 5 crates of blackberries per day. The telephone brings the orders and the car strings them out 5 to 7 miles from home. Our neighbors get the berries and we get the money.

E. E. Laughlin, Bates County.

Co-Operation Among Farmers

Minnesota has more co-operative enterprises than any other state in the Union, according to a bulletin on "Statistics of Co-operation Aomng Farmers in Minnesota," by L. D. H. Weld, Chief of the Division of Research in Agricultural Economics of the University of Minnesota. The farmers of the state are much more thoroughly organized than is generally realized. On January 1, 1914, there were 2,013 co-operative oragnizations in the state and in the year 1913 these did a total business of nearly $61,000,000.

The organizations include creameries, elevators, stock shipping associations, stores, fire insurance companies, telephone companies, cheese factories, potato warehouses, fruit shipping associations, cow testing associations, lumber yards, cattle and horse breeding associations, and many others.

Tillage of Great Importance

It is now being held by many that tillage is easily the most important of the three factors involved in increasing crop production. The improvements that have been made in tillage methods and in the development of better machinery has, without doubt, done even more in recent years to promote agricultural progress than better seed and the addition of fertility of the soil. It has been proven, by way of example, on a Kansas farm, that by merely disking the land immediately after harvest, followed by plowing, that part of the field listed has yielded 46 bushels an acre, while the average of the entire farm was but 25 bushels an acre, or an increase of 21 bushels an acre, by such a simple change in tillage as the disking of the land immediately following the binder. The Kansas Experiment Station, as a results of several years trials, has clearly shown that plowing earlier and deeper will more than double the yield of wheat per acre.—Kansas Farmer.

Farmers' Elevators Do a Big Business

Farmers' elevators in Minnesota, in handling the crop of 1912, did a business of $24,000,000. Of this amount $22,000,000 represents the value of grain marketed and the other $2,000,000 the value of supplies, such as coal, feed, and twine, purchased for members.

These figures are taken from a bulletin on "Statistics of Co-operation Among Farmers in Minnesota," by L. D. H. Weld, Chief of the Division of Research in Agricultural Economics, of the University of Minnesota.

The number of farmers' elevators in Minnesota is 270, according to Mr. Weld's statistics, and the aggregate membership in these companies is 34,500, or an average of 128 to each company. In all of these 270 companies farmers own a majority of the stock, and in all but 5.5 per cent of them each stockholder has but one vote irrespective of the number of shares owned. In other words, the elevators are not only owned by the farmers, but they are controlled democratically by them.

Hustler Wanted in Every County

The Missouri Farmer wants a hustling representative in every county to represent it in taking subscriptions and a man who enjoys the confidence of farmers and who is willing to work can make $100 per month. Only high class men need apply. The Missouri Farmer, Columbia, Mo.

American Guernsey Cattle Club Issues Valuable Pamphlet

The American Guernsey Cattle Club has recently published a valuable pamphlet for the benefit of Guernsey breeders and the public in general who are interested in knowing what this breed is accomplishing. This pamphlet is of handy size, neatly bound in a gray cover, is well illustrated with pictures of the leading cows of the breed and contains much valuable information. In the forepart of the book appear statistics regarding the Advanced Register work which have been compiled in such a way that they make very interesting reading. Fifty-five of these cows have three or more yearly records. The names of these animals, together with the production and the ages at which the records were made are given in detail. What is known as the 35 class leaders or the cows holding the five highest records in each of the several classes from two years of age to five are given as they appeared on April 15, together with the average of all cows tested in each class and the average for the breed.

Following this there is an interesting description of the breeding and feeding of the three Guernsey cows, Yeksa Sunbeam, May Rilma and Murne Cowan, which produced World's Champion records over all breeds. The cost of these records and profit from same is also discussed.

Following this a report of a study of 3000 A. R. records appears. In this study the first 1500 records completed by Guernsey cows is compared with the last 1500, in production of milk, butter fat and average per cent. There are now nearly 4000 Guernsey cows which have completed yearly official records. The address is American Guernsey Cattle Club, Peterboro, N. H.

Missouri Equines at State Fair To Be In High Favor This Year.

With every type of the Missouri horse being drawn on to supply mounts and artillery animals for the belligerents of Europe the horse industry is to take on an impetus this year that will be truly remarkable. Never in the history of America has there been such a situation confronting the farmer who produces horses. Never was there such a demand for good animals of all classes. With Belgium out of the horse producing business for years to come, and forced to come to America, whenever the wars cease, to secure breding stock, the draft horse business is looking up. Light harness horses of the type that are still utilized at home as well as being in great demand abroad, are to be in equally great demand. The exhibit of horses at the Missouri State Fair this fall, September 25 to October 2, will take on unusual interest. The cash prizes are the best ever offered by the Missouri State Fair Board. Missouri possesses some of the best Belgium and Shire horse studs and breeding farms in America and must take the place to a considerable extent of Belgium in the horse world. Breeders will be pleased to note that $250 has been added to the draft horse premiums.

Amazing Prices on STEEL Shingles

A lifetime bargain on Edwards Steel Shingles to a limited number—a sensational opportunity to those who write at once. You can buy the patented genuine Edwards Reo Steel Shingles—that won't rot, rust, crack, burn or leak—for the same price as good wood shingles.

Wood Shingles Out of Date

Wood Shingles are no longer popular since Edwards Interlocking Steel Shingles have proven to be the best, in all kinds of tests. Over 135,0 0 successful farmers now use Edwards Steel Shingles.

Easy to Lay—Saves Time

Come in big clusters ready to put on. A few nails, hammer and a little time—10 times faster and 10 times easier than putting on wood shingles, one at a time. Edwards Shingles are rust and leak proof.

$10,000 Guarantee Bond

Get a copy of our $10,000 guarantee bond protecting all Edwards Reo Steel Shingle Roofs against dangerous lightning. We believe in protecting our customers.

How We Figure Prices

We sell our Steel Shingles at actual factory cost plus a small profit—our large business permits this. You get the jobber's profit, dealer's profit and salesman's profit, as we sell direct to you and we pay the freight.

Write Before We Are Oversold

This unusual offer won't last long. So write for prices and Catalog 10384 today—give us dimensions of your roof if possible. We manufacture all kinds of steel roofs for buildings, steel garages, etc.

The Edwards Manufacturing Company
10384 Lock Street, Cincinnati, Ohio

$500 IN PRIZES

Besides Liberal Commisions

Here is a chance to earn a handsome prize during the summer months, besides a liberal commission on every subscription.

The Twice-A-Week Globe-Democrat, one of the oldest and best-known newspapers in the country, wants more subscribers and will pay you well to work for them. It is the largest and best edited semi-weekly in the country—10 pages each issue—contains all the news of the world, sporting news, rod and gun news, serial stories, short stories and humor, women's page, markets and two pages of farm news. New price only 50 cents a year.

EASY TO MAKE MONEY

Everybody will subscribe when you show them the paper and tell them you want to earn a prize. Contest closes September 2d. The time is short. Make your application today.

J. B. Gurthet, Pattonsburg, Mo., Oct. 29.

Bland's Poland China Sale September 16

Halleck Bland of Centralia, Mo., is planning to hold a public sale of Poland Chinas at his farm near Centralia, Thursday, September 16.

Mr. Bland has maintained his Longbranch herd for a number of years, but heretofore, has disposed of his stock at private treaty. Readers of this paper are more or less familiar with Mr. Bland's herd and many of them have purchased breeding stock from him. Mr. Bland has selected a very desirable lot that he is preparing for the sale and it will be to the interest of those who are looking for size and quality to keep this sale in mind. Watch this paper for further details and in the meantime it would be well to write Mr. Bland and ask him to put you on the mailing list for his catalog.

Megown's Spotted Polands

B. B. Megown, New London, Mo., writes this department that the spring boars and gilts he is now offering are by odds the best he has raised and that he is prepared to offer a very attractive proposition to readers of The Missouri Farmer who are in the market for Spotted Poland Chinas. Mr. Megown believes that the Spotted Poland China is the farmer's ideal hog when bred and developed along lines calculated to combine size and bone, with easy feeding quality and prolificacy. Our readers should write Mr. Megown before making their purchases. We are glad to recommend this herd. Kindly mention this paper when you write.

High Producing Jerseys

Wm. H. Bruns & Son, Concordia, Mo., advise us that they still have several extra good young Jersey bulls and heifers that they are pricing worth the money. Several of these bulls are ready for service and are sired by The Owl's Champion, whose grand dam, Rubano's Fancy, was a 21-pound cow. This is an opportunity to secure the right kind at the right price.

Spring Grove O. I. C's

Beginning with this issue of The Missouri Farmer the well known herd of O. I. C's owned by S. D. and B. H. Frost, Kingston, Mo., is placed before our readers.

The Spring Grove herd was established almost thirty years ago by L. L. Frost, father of the present owners. The senior Frost came to Missouri shortly after the war, and having been raised in Pennsylvania, where, in those days, any but a white hog was a curiosity, he naturally selected the breed he was most familiar with. The early selections were made from the leading breeders of his day and a constant effort has been made by father and sons to improve the herd, and for years it has ranked among the really high class collections of the breed. Messrs. Frost have followed the practice of showing with marked success and a list of their winnings at the leading shows would require considerably more space than we have at our disposal. Perhaps the crowning event of their show yard career was their exhibit at the World's Fair at St. Louis, where Spring Grove breeding came out with the highest honors in competition with the best of the breed. In recent years the herd has added many additional honors to its already long list.

At present the herd is in excellent shape to take care of the wants of any of our readers. Something over one hundred head of early spring pigs are now ready to ship.

The writer visited this herd last week and does not recall having seen a thriftier, or more uniform lot of young boars and gilts on any farm this year. Most of them are sired by Triumph 38713, a grand champion son of the great White Eagle Chief, and by Gage's Leader 47863, by Honest Leader. Gage's Leader was junior champion at St. Joe last year. The dams of these pigs are daughters of prize winners, prize winners themselves, dams and grand dams of winners. Every one is immune, and sold on a liberal guarantee.

Besides the spring stuff referred to, a number of fall boars are for sale at prices that are astonishingly low. Our readers will do well to bear in mind that the Frost herd will stand the closest inspection. and we feel sure that buyers will be surprised at the very reasonable prices asked. Mention The Missouri Farmer when you write.

Peabody Shorthorns

June K. King & Sons, Marshall, Mo., advertise a choice lot of young Shorthorn bulls and heifers for sale. The Peabody herd is one of the pioneer herds of the Middle west and has long held a place among the really top herds of Missouri. Readers of this paper need have no hesitancy in placing their order by mail for anything that Messrs. King are offering.

Do You Like Bacon?

Most everyone does—especially those who have purchased Yorkshires from Frank Gildow, Jamesport, Mo., Mr. Gildow writes that he has only a limited number of spring boars and gilts on hand sired by his State Fair winner. The herd is being closed out on account of other business. Yorkshires are the accepted bacon hog for the Corn Belt and the blood offered by Mr. Gildow represents sevral of the most popular herds in the United States.

Durocs and Shorthorns

J. E. Weller, Faucett, Mo., is offering a highly desirable lot of Duroc spring boars and gilts sired by his well known boar, E. Pluribus Unum 130853. Mr. Weller is also offering good useful Shorthorn cattle at prices that will be difficult to duplicate. Buyers in sixty Missouri counties are evidence that Mr. Weller gives value recived. Get his prices.

Andrews Annual Spotted Poland China Sale

Readers of The Missouri Farmer will be interested to learn that Thursday, October 14, is the date claimed by the Andrews' Stock Farm, Lawson, Mo., for their annual sale of Spotted Poland Chinas.

As usual Mr. Andrews will offer about forty or forty-five head of the top boars and gilts from his spring crop, but in addition, we are informed that this year there will be a number of the very best producing herd sows put in as a very special attraction. It takes nerve to catalog one's best sows for public sale, but no one has ever accused Jim Andrews of lacking nerve. Remember the date, October 14.

Gage's Leader, the junior herd boar in service in the Spring Grove herd

DUROC JERSEYS

Select Col. II--Crimson Col. I Am

I can furnish spring pigs, fall yearlings and tried sows. Bred the way the winner's are. Priced reasonable. Come and see my herd.

A. WHITE, JR. Box 422 PALMYRA, MO.

ADENHILL DUROCS--SPRING PIGS

Spring pigs sired by Col. Wonder II out of sows carrying as good blood as the breed affords. Get my prices before you buy.

R. L. HILL - - - - - - - - Adenhill Farm, Columbia, Missouri

CHOICE DUROC SPRING PIGS

Sired by COL. WONDER 2nd. Prize winner at Missouri State Fair 1913.

Will show again 1915 at State Fair and at the Panama Exposition, San Francisco, 1915. Others sired by Beauty's Col. and I Am Col. Enough. Dams carrying blood lines of Col. Gano, Col. Wonder, Crimson Wonder Again, Col. Chief, Beauty's Model Top, and B. & C's Col. II. The big type bone kind.

The purchaser satisfied or money refunded.

Dooley's Spotted Polands

Big bone, spotted pigs now ready to ship —$25 single pig, $45 pair, $65 trio. Pairs and trios no relation. Also registry furnished. Send check with first letter.

EDGAR DOOLEY, ETTERVILLE, MO.

E. W. Cook's Poland China Sale.

On Thursday, October 7th, E. W. Cook of Pattonsburg, Mo., will make his initial sale of strictly high class, big type Poland Chinas, and this sale promises to be one of the real events of the season.

About two years ago Mr. Cook decided to establish a herd of Poland Chinas that would rank with the best in the Corn Belt and how well he has succeeded you will be permitted to judge on the above date. Mr. Cook founded his herd with top selections from the best herds of the breed, selecting only such individuals as met his critical standard, of size, bone, quality and type, backed up by blood lines that had been proven. There is not a herd in the state that can show more uniformity, size, and quality than will be found in the Cook herd, and we doubt if there will be a better lot sold this fall.

Watch this paper for further particulars.

The Blood of Champions

We once heard a well-known breeder make the remark that any man who succeeded in breeding one grand champion in a life time was entitled to fame. We suppose a man who breeds two grand champions—two years in succession is not only entitled to fame but also to fortune. Chas. L. Taylor, Olean, Mo., has turned the trick and furthermore, judging from what the writer recently saw at Springdale Farm, some breeder will have to bring out a stemwinder to prevent another purple ribbon being added to the Taylor collection.

Mr. Taylor has made a remarkable record on Col. Wonder and his get, and this boar is conceeded to be one of the best of the breed. At present Mr. Taylor has more Col. Wonder blood on his farm than ever and is in position to furnish our readers spring boars and gilts possessing to a marked degree the qualities that have made their sire famous. Write Mr. Taylor for prices, you will be surprised to find how extremely reasonable you can buy this blood.

Faulkner's Annual Spotted Poland China Sale

On Wednesday, August 11, H. L. Faulkner, Jamesport, Mo., will hold his annual August sale of Spotted Poland China bred sows and gilts, and spring boars. Each year Mr. Faulkner holds two sales, one in August and one in February, and for years breeders and farmers throughout the Corn Belt have come to look forward to them. Mr. Faulkner is one of the pioneer breeders of the old-fashioned, big-boned, big spotted kind, and each year breeds and handles around five hundred head.

The kind of sows that have made the Faulkner sales popular

There is hardly a herd of any pretensions in the country but what was started with foundation stock from Mr. Faulkner's herd or that does not contain more or less of his breeding.

The approaching sale will consist of around sixty head, including bred sows, bred gilts, and spring and fall boars ready for service.

The offering is quite up to the standard of former years and breeders and farmers will have no difficulty in finding what they want. Among the bred sows offered are several that are particularly attractive and would make valuable addition to any herd.

If you want to add some of the blood that has made Mr. Faulkner's name synonymous with this popular strain of Poland Chinas you cannot afford to miss this sale. Remember the date, Wednesday, August 11. The catalogs are now ready to mail and will be sent to all who ask for one. Mention this paper when writing.

Baker & Sons' Polands

Recently the writer visited W. A. Baker & Son, Butler, Mo., who advertise Poland Chinas elsewhere in this paper, and found these gentlemen all smiles in spite of the rain. Messrs. Baker are feeling particularly pleased with the way their herd is doing this year, and they certainly have reasons to be. We don't think we ever saw a better lot of spring pigs on this farm than the 1915 farrow. The two herd boars, Big Look 63604 and Big Bone's Son, Jr. 71940 are about equally represented, and the class of pigs these two boars are siring will meet with universal approval. Several litters are being raised that are sired by Smooth Columbus, one of the best young boars of the breed. The Bakers believe in the big type Poland China, in fact, W. A. Baker is one of the pioneer breeders of this state, but they are not making the fatal mistake of breeding for size only, they want the big kind, but demand quality. That their kind are right is evidenced by their winnings at the leading Mid-West fairs the past few years. This firm is preparing to take out a herd this fall and we believe that they will open the circuit with a herd that is considerably stronger than the one they had out last year.

Readers of this paper who are in the market for a spring boar or gilt or a young herd, can find what they want at Bakers' at reasonable prices. Several fall boars are for sale also. Mention this paper when you write.

J. B. Smith, Platte City, Mo., is offering Jersey bulls and heifers at extremely low prices. Mr. Smith is one of the best known exhibitors at the leading shows and fairs.

Only One Profit to Pay

Note the new ad of The Ennis Farm, offering their Perfection Spotted Polands. Mr. Ennis is now one of the largest breeders of the Old Original Big Boned Spotted Polands and to supply a continually increasing list of customers he is continually increasing his herd. To give satisfaction is his guarantee; to make pleased customers is his business. He is now offering spring pigs, pairs and trios not related, and bred gilts. Every pedigree sent out from this herd reads "Bred at The Ennis Farm," no "dealer" or "jobbing" or buying and selling business done. You only have one profit to pay when you buy there. Their herd consists of forty brood sows and gilts and six great herd boars. They are especially well equipped for raising fine pigs being in the "blue grass and purewater" section of Missouri, and they also have the Sunset Jersey Cattle herd of over 100 head from which sweet cream is shipped to the St. Louis market leaving a large amount of fresh separator milk for the pigs.

This herd is well known in many sections of the country and one sale in a new territory generally means additional sales to the same point. Dr. G. L. Henderson, Greenbrier, Ark., recently wrote: "Pigs doing fine. Those of us who bought of you have caused a great demand here in this county for your stock of hogs." Another customer advised that he had already sold four pigs from his gilt a month before the gilt was due to farrow. An Iowa customer in sending order for a boar wrote: "My gilt is doing fine. She farrowed seven pigs, four sows and three boars; saved them all." These are the kind of letters coming almost daily to The Ennis Farm. They ask you to get their free circular and prices before buying elswhere. Address, The Ennis Farm, Horine Station, Mo. (Just south of St. Louis)

McPherson's Durocs

Beginning with this issue of The Missouri Farmer J. E. McPherson, Columbia, Mo., directs the attention of our readers to his spring crop of Duroc boars and gilts. Mr. McPherson has been handling Durocs for a number of years, but this is the first year that he has made any particular effort to dispose of the produce of his herd for breeding purposes. Like most men who enter the business of producing high class, pure bred live stock in a serious way, Mr. McPherson waited until he felt sure that his stock had sufficient merit to be worthy of the best buyers.

Most of the offering are sired by the senior herd boar Golden Tat, by Tatarrax Again, the boar that has done such valuable service in the herd maintained by the College of Agriculture, and by Bob's Col. Wonder, by Col. Wonder II, one of the very best boars ever sired by the champion Col. Wonder. Golden Tat is a boar that will appeal to most Duroc men as he has the size, and bone and quality so much in demand and pigs sired by Golden Tat are showing exceptional stretch and quality. Bob's Col. Wonder is a boar that Mr. McPherson selected as the best boar he could find to use on Golden Tat gilts and his judgment is borne out in the present offering. Besides the above boars Mr. McPherson has one litter by the champion Col. Wonder and one by Professor's Col.

Included in the offering are ninteen extra good February boars by Bob's Col. Wonder that are the big stretchy kind and represent very excellent values.

Lack of space prevents more detailed information at this time but we will have more to say concerning this herd from time to time. We are glad to call attention to this herd and urge our readers to write Mr. McPherson at once. Kindly mention The Missouri Farmer.

THOMAS E. DEEM
AUCTIONEER
Selling pedigreed live stock is my specialty. Eight years of success in this line has proven that my customers are pleased.
Dependable service at a reasonable charge. Address, Cameron, Mo.

CHESTER WHITES

RAUSCHER'S CHESTER WHITES!
One of the Oldest Herds in the West
A few choice spring gilts bred for early farrow. Several richly bred big spring boars. A fine lot of fall pigs. Size, quality, and bone. Prices reasonable and every pig guaranteed.
H. Rauscher & Son, Kahoka, Mo.

Maple Grove O. I. C's
Over 100 spring pigs from 2 to 3 months old at the following prices: Choice of litter, $12; litter average, $10; fall gilts, $15. Bred gilts $20 to $25. Bred sows, $30 to $35. Prize winning blood and the most popular strains. Each individual guaranteed to give satisfaction
F. J. GREINER, BILLINGS, MO.

100 Prize-Winning O.I.C's
Our herd is headed by grand champion and champion boars of 1914 shows. Sows of equal merit. All backed by long line of prize winners. Early pigs, singles, pairs or more not akin, at rock bottom prices. We can please you. Write or come.
S. D. & B. H. FROST,
Box H Kingston, Mo.

Glenvarloch Large Yorkshires
The prolific, growthy and gentle bacon hog. Closing out entire herd at private sale. Bred sow, boars and pigs either sex. The produce of one Yorkshire sow will keep your family in delicious meat all next winter. Everything at bargain prices. All immune.
Frank Gildow, Mgr., Jamesport, Mo.

MOLASSES Best Feed for Pigs and Calves
St. Louis Molasses Co., Dept. MF.,
400 S. Broadway, St. Louis.

JERSEY CATTLE

JERSEY CATTLE
Bulls ready for service. They are sired by the Owls Champion 85990. His grand dam on dam's side, Rubano's Fancy, has a record of 21 lb. 10 oz. in 7 days. We have these young bulls for sale at a price that ought to move them. Also a few heifers.
Wm. H. Bruns & Son, Concordia, Mo.

Jersey Cows
I want to sell 20 head of registered cows and heifers that are either fresh or soon will be. Also four young bulls.
J. B. SMITH Platte City, Mo.

HOLSTEIN CATTLE

IN MISSOURI
Eight bulls, 2 to 8 months, $100 to $175 each. Always have a few good cows and bred heifers for sale. Nothing but registered Holsteins.
S. W. COOKE & SON, MAYSVILLE, MO

HOLSTEINS
Young bulls and heifers from A. R. O. cows. Sired by Sir Korndyke Imperial 53683. Eighty per cent of herd have A. R. O. records. Inspection invited.
M. E. Moore & Co., Cameron, Mo.

ANGUS CATTLE

ChoiceAberdeen-Angus
Established 30 years. 100 head in herd. We are offering good useful Bulls, and Heifers of excellent individual merit and breeding. Prices reasonable. Our customers make them popular.
D. L. Sutherland & Sons Windsor, Mo

Aberdeen-Angus
I am offering a number of young bulls, cows and heifers—good individuals and well bred. Also some extra good Poland China Hogs at moderate prices.
J. D. Blackwell Fayette, Mo.

ANGUS CATTLE
HERD FOUNDED 1904
Seven early calves—3 BULLS and 4 HEIFERS, sired by Dean's Eric 139686. Every one the right kind, and priced to sell.
V. E. LAWRENCE, SALISBURY, MO.

Angus Bargains
Registered bulls and heifers. The market topping kind. Leading families represented. Priced worth the money and satisfaction guaranteed.
Also Poland China hogs.
J. M. JONES, R. F. D. 3, EVERTON, MO.

OTHER BREEDS

Shorthorn Bulls and Heifers
PEABODY FARM now offers 12 choice young bulls and 20 heifers. Good individuals; reds and roans. Priced to sell. Also 20 open BERKSHIRE gilts. Get our prices.
June K. King & Son Marshall, Mo.

GALLOWAY CATTLE
Young stock for sale at all times. Herd established 25 years.
J. & W. R. CLELLAND,
New Hampton, Mo.

Registered Devon Cattle
Choice bull calves for sale from good milk cows. Bred at Northview Farm.
J. A. CASE Concordia, Mo.

SNYDER'S RED POLLS
Bulls and Heifers
I am offering for sale a number of choice young bulls and heifers. Excellent breeding and individuality. Prices moderate. Write your wants or visit my herd.
A. P. Snyder - Polo, Mo.

150 Duroc Boars and Gilts
February, March and April boars and gilts sired by Golden Tat, Bob's Col. Wonder, Col. Wonder and Professor's Col. Stretch, size, bone and quality. Priced for quick sale. Write or come.
J. E. McPherson, Columbia, Mo.

Reliable Silo-Filling Power Costs Less NOW

MY FREE BOOK TELLS WHY

Road Portables in this style, either Gasoline or Kerosene engines, sizes, 6, 8, 12, 16 and 22 H-P.

Proof of Engine Quality Given by WITTE Users

Our 16 H-P. WITTE portable engine is giving satisfactory service. We are using it for threshing and filling silos.—**Chas. H. Clarke, 517 Third St., Des Moines, Iowa.**

Men who thought they knew told me my 6 H-P. WITTE engine wouldn't run it, but I got an Ohio cutter and blower, and cut four tons per hour. The engine is all I can ask.—**Charles O'Neal, Marshall, Ark.**

My 12 H-P. WITTE engine is operating a No. 12 cutter, 34-ft. carrier, and cuts five to six tons of silage per hour in good shape.—**J. A. Gould, East Hampton, New York.**

My 12 H-P. WITTE engine has filled eight silos. Can fill a 12x30 ft. silo in seven hours. Am using a 16-inch cutter.—**A. P. Peterson, Almena, Wisc.**

My 8 H-P. WITTE kerosene engine did fine work filling two silos. If I buy another it will be a WITTE.—**G. F. Kremer, Elsie, Mich.**

The 12 H-P. WITTE engine on my farm has been used for many purposes, and at all times has given the best of satisfaction. Find by comparison with others its cost of operation is considerably less.—**John M. Egan, Pres. Metropolitan Street Railway Co., Kansas City, Mo.**

I had not had any experience when I bought the 22 H-P. WITTE engine, and am highly pleased. If I buy another, it will be a WITTE.—**James A. Lowe, Erie, Kans.**

I am a good friend of the WITTE engine, having used a 22 H-P. for nearly seven years.—**Jas. R. Plumb, R. F. D. No. 1, Emporia, Kans.**

The 22 H-P. WITTE engine which I bought about two years ago is working satisfactorily, and has not given me any trouble.—**H. M. Basford, Hillsboro, Ore.**

During the 12 years, my 12 H-P. WITTE engine has cost me practically nothing for repairs. I run a 16-inch ensilage cutter and cut a wagon-load of green corn in ¾-inch lengths and lift it into the silo in 12 minutes. I still believe that no engine is better.—**John A. Reynolds, Winchester, Kans.**

I filled three silos in 72 working hours with my 6 H-P. WITTE engine. Used a No. 19 Hocking Valley cutter, blower type, with 12-inch knife.—**C. V. Chase, Thompson, Conn.**

My 6 H-P. WITTE engine certainly does its work in great shape. It takes just one-half as much gasoline as the —— make engine which my partner is using.—**M. Steinback, Heartwell, Nebr.**

Our 12 H-P. WITTE engine is running in this high altitude, and I am entirely satisfied with it.—**W. J. Elliott, Webb, Ariz.**

Four years ago I bought my 16 H-P. WITTE engine. I had never had any experience and lived 30 miles from town, but in four years have not had any repairs or trouble.—**Andrew Garcia, Cry, Mont.**

And thousands of other reports of similar character.

My Latest Prices:

WITTE ENGINES

Gasoline, Kerosene, Distillate and Gas

SILO filling requires steady power—fast and heavy work through the whole day. Ripening crops do not wait—they must be efficiently handled in their proper time. And the lower the power-cost of handling, the cheaper is the cost of the silage.

For many years WITTE engines have proved their reliability for steady and continuous running, and easy handling of load up to rated capacities. All sizes are easy to start, without cranking. With my low prices and the fuel-saving, and wear-resisting qualities of WITTE engines, you get your power-cost at the bottom-most notch possible with a general-purpose, liquid-fuel engine. Let me send you what hundreds and hundreds of my customers say in proof of this statement. I want you to know that this is no empty claim. It is a fact of first importance to you as well as to me.

Stationary Engines for less than $17.50 Per H-P. Why Pay More

Sold only Direct from Factory, or from Pittsburgh, Pa., Warehouse. Prompt Shipments. Cash or Easy Terms. 5-Year Guaranty.

For 28 years—longer than any other present manufacturer of liquid-fuel engines—I have been making engines—doing nothing else. You will find my engines at all kinds of work, in all parts of this country and in many foreign countries. Everywhere they are used you will find WITTE boosters. I give my old customers the credit for building up my factory from nothing, until now it is one of the largest in the country—when I am the only man in the business who started, or was running, when I started. I couldn't have had my many thousands of boosters without shipping them engines worth their boosting.

Before you buy your new engine, I ask the privilege of showing you all about the WITTE. The space in this advertisement does not permit the many pictures necessary to show the construction of all parts and their operation, each in relation to the others, as my 28 years' experience has taught me how to build them for better quality. I don't want you to judge my engines alone from my low prices, or from the limited information I can give you here. My new book shows everything—my big factory with free power from my own natural gas well—the mass of newest type machinery needed for low-cost manufacturing—and details of my engine construction.

Stationary Kerosene engine on iron sub-base Sizes, 2, 3, 4, 6, 8, 12, 16 and 22 H-P. Also furnished on skids as shown below. Besides Kerosene and Distillate, this engine burns Gasoline and Naptha without any changes in equipment.

Stationary Gasoline engine on iron sub-base. Sizes, 2, 3, 4, 6, 8, 12, 16 and 22 H-P. Also furnished on skids as shown below. All stationary engines, like the portables, are completely equipped ready to run, for prices quoted.

Stationary Gasoline engine on heavy wood skids. Sizes, 2, 3, 4, 6, 8, 12, 16 and 22 H-P. This is the regular mounting for prices above quoted. Iron sub-base is small cost extra, shipped only on special order.

BETTER FARMING BETTER FARM HOMES BETTER CITIZENSHIP

THE MISSOURI FARMER

COLUMBIA, MO.

THE HOME OF MISSOURI'S GREAT AGRICULTURAL COLLEGE AND THE MISSOURI EXPERIMENTAL STATION

Plundering the Farmer

Some days ago the Supreme Court of Missouri assessed a fine of $5000 against one of the big Chicago Packing concerns because of its violation of the anti-trust laws of the state in the purchase of cream. Left to its own unlawful methods, it would soon have strangled the life out of every independent creamery in Missouri. The means employed are as old as monopoly itself and consist simply in paying a higher price for cream at competitive points than at non-competitive points—and once the local creamery gives up the fight, the Trust has the farmer completely at its mercy and from that time on can offer what it pleases for his cream products and he is helpless. The Missouri Farmer has watched this case with unusually keen interest because it had a great deal to do with bringing this situation to the attention of the Attorney General. However, the payment of $5000 on the part of this gigantic concern is a mere bagatelle and unless the state exercises a continual surveillance and scourges this law defying corporation from the state at the first sign of a repetition of its old practices, the verdict of the Court will accomplish little permanent good.

Missouri is naturally the greatest Dairy state in the Union and this great industry is just beginning to get a foothold which, if left unhampered, means an increased annual income of many millions to the farmers of this state—but everything depends on throwing off the strangle hold of these sinister influences which care naught for square dealing where the almighty dollar is involved. The day is here when greater farm profits and the maintenance of soil fertility demand that we should turn more and more to live stock—and yet squarely in this path stand the purchasers of live stock products, and unless they are brought within the strict pale of the law from this time forward they threaten to become a mill stone about the neck of American Agriculture.

However, the violation of the law in connection with the purchase of cream products is merely one of the minor crimes of which these concerns are guilty. We are satisfied that during the last few years the same influences have robbed the farmers of Missouri out of many millions of dollars in the purchase of farm produce such as Poultry, Butter and Eggs —and on behalf of the farmers of this state The Missouri Farmer announces that from this time forward these practices must cease if the laws which have been written into our statute books mean anything. If these laws are ineffective, then the sooner we find it out the better.

For years there has been no free and independent competition in the buying of farm produce in Missouri. So powerful and so bold have these concerns grown that the average country merchant stands helpless in their clutches—and as a result, the situation is almost totally in the hands of these cormorants who instruct their agents in practically every hamlet in the state what they shall pay for what the farmer has to sell—and from this mandate, as matters stand today, there is no appeal. When it is considered that the average yearly Poultry products of Missouri alone are valued at $50,000,000, the reader can easily realize what the farmers of this state have at stake in this situation.

In the solution of these outrageous conditions it is not merely necessary to invoke the power of the law but the country merchants of Missouri must join in the fight to the end that they may once more become virile and independent factors in the communities in which they live—for in return for the patronage which he gives him, the farmer has a right to demand of the country merchant that he help to rescue him from a condition of affairs to which he is paying a tribute of millions of dollars annually. We do not as yet know just where the paths in this great fight may lead, but The Missouri Farmer serves notice that from this time on its "hat is in the ring" and that it proposes to find out whether this plundering of the farmers of this state in the sale of country produce is necessarily a "necessary evil."

William Hirth.

Attention! We suggest that all our readers read the opening chapters of the great serial story which begins in this issue.

THE RURAL SCHOOLS

The rural schools of the United States are absolutely no better than they were half a century ago—or a century. In fact, I think they are absolutely poorer; for a century ago the schoolmaster was much more of a figure in the life of the community than he now is. In fact, the country schoolmaster has almost entirely given place to the schoolmistress. The men have more important business than teaching! The irony of this statement, when of all business that of teaching is most important, and when it is good teaching, of all work it is most productive in terms of dollars and cents! Fifty years ago teaching was one of the very few lucrative occupations open to women, while now it stands somewhere near the median line in public appreciation between the confidential secretary or the head of a department in a great store, and the sweat-shop girl and the five dollar a week saleswoman in a long and increasing list of employments. So that fifty years ago the schools received and held for a time the best of the women who were earning their living, while now they must struggle to attract women of only average ability. Methods of teaching may or may not have improved. Systems of education are undoubtedly more efficient in the miseducation to which they are mainly devoted. But when the enormous importance of the teacher's personality is considered, I seriously question whether or not our rural schools are not absolutely poorer than they were fifty or a hundred years ago.

Relatively to the schools with which they must compete, I have no doubt that they are very much poorer. City schools have made much progress. They are housed in beautiful buildings, and they are pleasant places in which to be miseducated. They are clean and healthful. Their teachers are on the whole better prepared for the work they are called upon to do. The very numbers in attendance tend to awaken that school spirit which makes for happiness. They end in the air, as do our rural schools, but there is a concreteness in the form of graduation exercises and diplomas, with colleges hard by, which gives the pupil the impression, fallacious as it may be, that the road leads somewhere. For young people seeking jobs, the city schools have real superiority in addition to their apparent superiority; for the high-school pupil finishes his course in a place in which jobs are to be had, and parents, pupils, and teachers are in touch with those who have jobs to give out. And not all the city schooling is fruitless or valueless. The amount of teaching which prepares the child for actual work in the world is increasing, and vocational education has supplemented manual and domestic training in many towns and cities. All these things considered, the city schools are very much better than they used to be, and therefore vastly superior to the rural schools.

Better Schools Take People From the Farm

And this is an important matter—this relative excellence of city and country schools. For every child feels as soon as he can think the rival demands and claims of city and country on his life. Every parent feels it as soon as his child is born. I do not need to speak now of the ominous figures showing the drift of rural population to the cities and towns. We all know of it. I do not attribute all of this portentous phenomenon to the inferiority of the rural schools; but I do believe that it has to do with more actual removals than any one other cause. People drift to the place where they will on the whole be happiest; and nothing makes the American parent more unhappy than the feeling that he is not giving his children the best possible chance. Thousands and thousands of people in the country are conscious of the fact that they are just making a living. They could make that in the city; and if in making it they could give their children better schooling, why not make the change? The difficulty of giving any answer to this question in favor of life on the farm is just the pennyweight in the balance which turns it in favor of city life—just the additional consideration which is building up a poverty-stricken city proletariat in place of an independent, healthful rural life.

But this is not the real indictment against our system of rural education. The high crimes and misdemeanors of this system lie in the fact that we are not preparing that more than one-third of our people who live on the farms for efficient citizenship. The greatest of all questions is that of national efficiency; and more than a third of that question for us lies in the efficiency of our rural population. In city and country our people are inefficient as compared with what they should be, and what they may be in twenty years; but in these remarks I am dealing with the work for national efficiency which might be done by the rural schools, and which in the main is not done.

Rural Schools Are Not Rural.

Our rural schools are not really rural. They are bad copies of city schools. Moreover, they are not copies of the better city school of today, but of the inferior ones of half a century ago; and therefore, they are bad copies of poor city schools. The city schools are making a bluff at preparing for college millions of young people who will in all probability never see even the high school; but the rural schools are making a bluff at imitating the bluff of the city schools and in doing so are blighting the possibilities in the lives of other millions of boys and girls who will certainly never get within sight of the collegiate heights toward which they are supposedly and theoretically faced.

Our rural teachers are mostly girls from the towns and cities who not only know nothing about rural life, but despise it. They endure it only as a necessary evil while they are seeking husbands or preparing themselves for city teaching or other city employment. They are surrounded by an aura of urban atmosphere. They model the schools as far as possible on urban lines, because those lines are the only ones of which they know anything. Even when teachers are acquainted with rural life and understand it, the very course of study is devised as if with intent to direct the minds and ambitions of the pupils cityward. The text-books are city text-books compiled by city authors, and published by city publishers. The problems in arithmetic relate to city transactions. The very history of the United States ignores the development of the rural life of the nation. The geography books pass over the geography intimately related to the life of the farm, and the world is looked at through city eyes. The language lessons, the physiology exercises, the reading and spelling lessons are all the outgrowth of city minds working very mistakenly for the miseducation of city children; and in this process of mingled wisdom and foolishness, every morsel of application to the real problems of life is lost, and things which are useful to city children become valueless and worse than valueless to the children from the farms.

And yet, about every rural school lies an educational plant which, for purely cultural purposes, the city schools would be willing to pay millions. City educators who see how intimately the processes of nature and the knowledge thereof are connected with the best and most prosperous unfolding of the child's character, are making every possible endeavor to bring to the city school those educational advantages which every rural school possessess, and which ninety-nine out of every hundred rural school refuse to use.

There is more geography in the affairs of any farming district than in our text-books on geography—and it is related to the day's work. There is more physiology and hygiene in the feeding and care and management of livestock and poultry than in the text-books, and it is physiology and hygiene in which all the family, and the family's income, are concerned. There is more good training in language in the recording of the local history and the daily observations of the life of the average rural district, than is to be found in all the language books in all the schools. There is more business arithmetic in the problems of farming than in the manuals which our text-book factories place in our hands. There is more chemistry in farming than in keeping a drug store; more bacteriology than in practicing medicine; more botany than in a high school course; more physics than the average factory laboratory; more mechanics than in any other life except that of the machine-shop employe, and more kinds of mechanics than in his.

Good Schools Are Coming

All over the United States there are springing up rural schools which take farm life as their educational plant and get an education for every child out of that life. Beginning in seed-analysis, seed-testing, milk-testing and the like, they are gradually transforming the old, dead rural school into a new kind of school in which every educational process is related to the life of the community. These schools are becoming the laboratories, the counting rooms, the workshops, the economic, and the social centers of their communities.

In such schools a training is given which is more truly cultural than can possibly be given in city schools. They are workshops in which the youth of the land are dealing with life itself. It is their own life. They see day by day the use and meaning of what they are doing. They will write better than their parents wrote, because they will be trained in writing their own thoughts and not those of others. They will use numbers more correctly, because they will be trained in an arithmetic of their own and their families' livelihood. They will be better farmers than their parents, because they will have spent their childhood years in studying the business of farming. They will be happier than their parents were, because they will know more of the mystery, the grandeur, and the charm of that nature whose processes they are interrogating day by day. They will be better educated than either their parents or their city brethren, because they will have been trained in the habit of thinking in terms of truth. Such will be the results of the universal adoption in our rural schools, not of agricultural education, but of educational agriculture. —Herbert Quick, Editor Farm and Fireside, before the Banker Farmer Conference, July 7, 1915.

If a Giant Cut the Wires

Suppose all telephones were silent, and that for forty-eight hours you could not even call a telephone exchange anywhere in the Bell System to ask what the trouble was!

Imagine the confusion which would prevail—with personal visits and messengers substituted for direct, instant communication; with sidewalks, street cars and elevators jammed; with every old-fashioned means of communication pressed into service and all of them combined unable to carry the load.

The instant contact of merchant with customer, of physician with patient, of friend with friend, would be severed; the business man and the housewife would lose the minutes and hours the telephone saves them. The economic loss would be incalculable.

There would not be time enough to do the things we are accustomed to do, and social as well as business life would be paralyzed.

Such a condition is almost inconceivable. The Bell System has developed telephone service to the highest degree of usefulness and made it so reliable that its availability is never questioned. It has connected cities, towns and the remotest places from coast to coast, and has taught the people the advantages of nation-wide telephone facilities.

Plans are made, buildings built and businesses run with Bell Service taken for granted, and yet we have to imagine what it would mean to be entirely without telephones before the great value of this ever-present service can really be appreciated.

The Silo a Farm Necessity

The best evidence we can offer that the silo is a necessity on every farm where live stock are kept is the results obtained by the farmers who have been using silos. The Missouri Farmer has received hundreds of reports from farmers who have fed silage from one to twenty years and we have not had a single one to condemn the silo. Two or three letters have been received from men who have not used the silo who raised theoretical objections but such evidence has no weight against cold hard facts.

There are so many makes of silos that any farmer should be able to find one to suit his means and tastes. One silo will keep silage about as good as another if it is absolutely air tight. Any one in need of a silo should first write the department of agriculture or the College of Agriculture and get all available bulletins and this may save some costly mistakes, but about the biggest mistake any cattle raiser can make is not to build one of any kind.

The Missouri farmer offers bright country girls a choice between a beautiful Piano or a free round trip Railroad and Pullman ticket to the great Panama Exposition. One of these prizes will be offered in every community in the state. Write us at once if you are interested.

The Missouri Farmer

VOLUME VII AUGUST 1, 1915 NUMBER 15

Bettering the Life of Farm Women

A Plea of a Farm Woman for Better Farm Homes

Have the needs of farm women made progress with that of the men? Have we allowed the betterments of the farm home and the conveniences for the work of the women to fall behind the improvements made about the barn and in the field? In writing to the department of agriculture recently a Missouri woman answered these questions affirmatively. She says: "When we compare our up-to-date cooking range, oil cook stove, and fireless cooker with the open fireplace and cooking utensils that mother used 60 years ago, and the sewing machines, ready-made clothing, and cheap denims, etc., with the old spinning wheels, hand looms, and hand sewing and hand knitting of that day, we must confess that the household affairs have kept pace with the mowing machines, harvesters, threshers, plows, etc., of the farm."

This Missouri woman makes out a pretty strong case in defense of the farm woman's progress and we are inclined to agree with her and accept the truth that farm women are just as progressive as their farmer husbands and that they have just as readily adopted labor-saving conveniences and have been as quick to use factory-made food and clothing when it would lessen their labor as the men have found ways to lighten their work. But while this is true it is evident to every thinking man and woman that if the wife, the mother, is to perform her duty and responsibilities of training the children and directing the home life of the family in the best possible way, it is our duty as men to give for our women the best social and domestic needs within our power.

A Farm Woman's Story

A few days ago the bankers of this country held a great meeting in Chicago and we have reported in The Missouri Farmer a number of addresses of distinguished authorities on agricultural matters laying before the bankers the needs of farmers. At that meeting there was also present by invitation a farm woman who was asked to tell how bankers can help the women of the farm. I am led to believe this subject touched the vital spot. It is going to take money to give us modern homes on the farms and modern conveniences in and around those homes and it is just as important that we get the banker interested in these home needs as it is to have him interested in our operations of feeding mules and hogs and cattle.

This farm woman, Mrs. Nellie Kedzie Jones, who is known to hundreds of Missouri farm women who have heard her talk so earnestly in behalf of her sex, had this to say about the betterment of the life of farm women:

"I live on a farm ten miles from a station, fifteen miles from a meat market, and I know what some of the problems are that face the farm women. I wish you bankers would remember first, last and always, that there should be a partnership of two on every farm to take hold and help. I wish you would remember that when you go to talk to the farmer about supplying him with money to do this, that or the other thing, that you would see to it that the farmer's wife comes in and hears all the talk. She won't come unless you ask her. Her husband, many, many times, will go and talk it over with her afterwards, but he won't think to insist that she come in and hear all the talk. I believe it is in the hands of the banker, the man who is going to help furnish the money, who is going to help improve the farm, to insist that the wife know all the conditions. She has got to sign the mortgage. She is going to do a large part of the work to help pay the interest money. She has got to know what is coming on the farm and what is going off of it, and why shouldn't she know the business end of it? I believe many and many a time things would have gone better on the farm as well as elswhere if the woman had known all the conditions from the beginning. A woman doesn't like to push herself, she doesn't like to say, 'Now, I want to hear that talk.' The farmer, perhaps, doesn't think about it. However, I have known many times when the farmer talked over business matters with his banker, and said: 'I want to think that over for a day or two.' He didn't want to say that he was going home and talk it over with his wife, but that is exactly what he wanted to do. If the banker himself sees to it that the farmer's wife knows all the conditions, I believe things will go better many times.

Field Work Not So Hard As Washtub

"I am not at all sure that these women who work out in the fields have the hardest end of it, by any manner of means. It is a great deal easier to stand on a load of hay and drive horses from one hay cock to the other and then drive that team into the barn than it is to stand over a washboard every day, and when a woman steps out in the open air and helps that kind of work, I am not half so sorry for her as I am when she has to sit up every night to bake her bread because her oven won't work.

"Not very far from the middle of our state there lives a little woman who washes and wrings her clothes by hand, who churns her butter in a little old-fashioned churn, who does all her housework in a hard way, and who all summer long bakes her bread in a little Dutch oven outdoors, because they can't afford a good cook stove. They are trying to build up a farm. She is doing the very best she knows how. She is doing the best she can with the materials at hand, and if she went into the bank, which is nearest to her, and where her husband has borrowed money, and asked the banker to lend her a hundred dollars to buy utensils for her home, I think that banker would fall down dead, he would be so astonished, but he would lend that husband $500, and say nothing about it. It seems to me that the bankers have a great opportunity in just that thing. If a man on the farm borrows $500, why shoulidn't a hundred of it go into utensils for his wife's use?

Wife of the Small Farmer

"Now, I am talking, as you see, for the little farmer, the farmer where the woman in the home has the hardest time. I would like to stand here and talk an hour about the farmer who can afford to put in a thousand dollar equipment, put in a good bathroom, and who on earth needs a good bathroom more than the farmer? I would like to see them put in a good water system which would bring hot and cold water into the house, into the sink. I would like to see them have a sink to begin with. A whole lot of them haven't a sink. I would like to stand here and talk for that, but there is not nearly so much need for that, for there are a great many of you talking for that. There are a great many of you saying, it will only cost a thousand dollars. That will mean only $60 a year interest to put in all these good things. I want you to begin with the little farmer and put into the farm home where the woman has the hardest part of it things that will make her life easier. Now then, they will pay,all these things pay. The woman who has the equipmen to do her work easily and well and do it in a shorter time, will raise more chickens, she will raise more calves, she will be ready with the interest money. Women hate debt. They despise to owe things, and if they can raise chickens and raise calves and have more and more, they will have their ducks and their turkeys and their geese, they are going to have their interest money ready on the date it falls due.

Time That Is Lost

"A great many of our farm women can be helped a little by providing them with incubators and brooders. I know women who spend hours every day chasing that wretched old hen that got out of the coop and dragged her twelve chicks out through the dew. Hours and hours they put in with the hens and turkeys and geese and ducks which would have been better used for their children and home. If the same women had had incubators and brooders so that they could raise their chickens easily and spend a quarter of the time on them that they do tending hens, they would have more time to do these other things. In all these ways the women will come right up with the interest money and just so sure as the man who borrows money is made to give his wife a part of it,—I don't want to say made,—just so sure as it is suggested to him that it will make it easier for his wife, just so sure the women will come forward with the interest money and the banker will profit thereby. There will be less farms taken over because the women will have a better chance to help out with the interest money.

The Children Need Mother's Time

"If a woman can do her work easily —sometimes she is compelled to do it in a hard way, but if she can do her work easily, she is going to use that time to better advantage for her family. How many little people on the farm know their mothers thoroughly and well? How many mothers sit down in the gloaming and rock their babies, on the farm? They have to be out here seeing that the calves are fed, they have to be over here, tending to the chickens, out seeing that the little pigs are taken care of, perhaps out helping stack the last of the hay, and the children having the comfort and the joy and the duty of the farm still miss the mother touch, because the mother works so hard that when it comes night she simply drops down into her bed and sleeps. She hasn't time for her baby.

"When we are trying to help the homes, we must begin on the farms, because so many of the children growing up in the country need it. I believe that the banker who goes out and gets in touch with the farm boy, who knows something of the aspiration of the mother, who perhaps will help that farm boy to go to college, who perhaps will see to it that the farm girl has some chance for education, is the man who is not only spending his money wisely, but is doing a great good for the world.

Give the Daughters a Chance

"All over the land there are farm women whose daughters have no chance. There are farm women on the little farms away up here in Michigan, away up in Wisconsin, on far-off farms of Iowa, those that are far away have got to work under handicaps, and in Missouri, in Illinois and through the Dakotas—these people have no chance, and they are the people whom you bankers can reach because everybody has to have some money some time. When you go out and touch these little farm homes you can touch them with the touch of human sympathy and thought for those girls and boys, so that the mother shall have the chance to do for her children.

I" wish I could put into every man's heart here the picture of the little home, the home where the children must have a chance, and when we remember that out through this great Middle West of ours there are 50,000

farm girls lost every year because they are trying to get out and do something; 50,000 girls who drop out of sight annually might have made splendid strong women in the land, if you and I had been able to do our best for them; when we remember that it means that you and I are going to take hold and do the very best we can to give the farm women a chance to do their work easily and well. When the farm woman has been aroused,the woman who on the little farm is striving to get the mortgage paid off so that she can do a little for her children as they grow up, then that woman is going to go on, and on, in her thoughts, until her children shall make better farmers than their father, better men and women than their fathers and mothers, because they have had a better chance.

"If I have brought to you the picture of the little home, the home where the woman needs help, I have done all that I wanted, and more, perhaps, than I could have expected, but I believe that every one of you men who goes back into his bank, will remember that the woman in the home is the one who perhaps holds the greatest power over the children growing up. We remember sometimes what our fathers have done for us, but every one of us has a tender inner spot in our heart for the place of the mother, and if you and I can help these mothers to live longer and be in their homes better and stronger women, we have done one of the best things in the world. I sometimes say that coffins are the most expensive things for a community in all the world. I hope that the woman who has to do the heavy, hard work on the farm, with few utensils, with little help, will not have to have her hands folded on her dress before her time. I hope she will have a chance to live to see her children grow up and go out into better homes than she had, and as these pioneers go out into the new countries to develop the cut-over lands, to break up the prairie sod, to make for this country of ours more acres on which to grow better crops, there is no crop that ought to be so well nourished and so well cared for, as the crop of young people. You may be proud of your farms, proud of your corn, proud of your cattle, but the importance of boys and girls means most to us all, and the help that we can give to the mother is the help that will make most growth for our boys and girls."

THE CALL OF THE SILO

The silo has been named "The Lighthouse of Prosperity"; practical farmers have said the silo is a better investment than additional acres; it is one of the most important factors in lowering the cost of raising live stock; and it is well known that almost 40% of the corn crop is wasted unless put in the silo. But one of the principal benefits of the silo is that it calls for better methods of farming. It calls upon the farmer to grow more corn on fewer acres and to grow clover, and other legumes.

The farmer is usually induced to buy a silo by reason of a short corn crop. He knows that if he does not sacrifice his live stock he must either buy feed or build a silo. He may put 40 to 50 acres of poor corn in his silo while his neighbor fills his from half the acreage; naturally he becomes interested in producing cheaper silage by raising more tons per acre.

The actual cost of raising an acre of corn varies but little while the yield varies greatly. The Missouri Agricultural College has obtained data from a large number of farmers showing that the average cost of raising an acre of corn is $13.50. This includes man and horse labor, seed, equipment, taxes, interest or rent.

The silo brings home very forcibly the fact that the profit lies in larger yields per acre not in a larger number of acres. The silo naturally calls for a system of live stock farming, and in live stock farming lies our principal hope of building up the land and at the same time making a living from it.

As every feeder knows, best results are obtained by the proper use of both classes of feeds, fat formers and muscle makers. Silage furnishes the cheapest supply of the former and home grown legumes the cheapest supply of the latter. Of course it is necessary to use some concentrated feed, but the amount is greatly reduced by using silage and alfalfa, clover, cowpeas or soy beans.

Legumes enable the farmer to draw upon the inexhaustable supply of nitrogen in the air and obtain free this most expensive element of plant food, and also furnish the cheapest source of the humus that is so badly needed on most of our land.

When the silo has induced the farmer to adopt a system of farming which includes the keeping of live stock to market crops "On the Hoof" and return, as manure, 50 to 70 per cent of the fertility removed by the crops, and the growing of a large acreage of legumes it has performed an important mission.

W. W. Lewelling, Montgomery County.

FERTILIZERS FOR WHEAT ON THE NORTH MISSOURI PRAIRIE

The use of fertilizers on wheat is steadily increasing in North Missouri. The prejudice against them is gradually disappearing. The reasons for this are found mainly in the fact that on the average level prairie or the worn rolling prairie fertilizers pay well, particularly on wheat to be followed with grass. The cause of the prejudice against the use of fertilizers has had some foundation, however, in the fact that farmers depending on fertilizers alone for maintaining soil productivness have finally failed to secure satisfactory returns. The continued use of fertilizers without proper crop ratation, manuring, or the use of green manures for maintaining the supply of organic matter in the soil will finally prove unsatisfactory. Used with proper systems of soil management for maintaining organic matter, however, they not only prove very profitable but continue to give good returns without ill effects.

The results of a number of years of experience with fertilizers, lime, etc., on a series of soil experiment fields in North Missouri have indicated quite definitely the best system of soil management for these soils. These results have been published as Bulletins Nos. 126, 127, and 128 of the Missouri Experiment Station at Columbia. They should be in the hands of all North Missouri farmers who are interested in soil improvement.

Briefly, the recommendations regarding wheat fertilization in this region may be summarized as follows: For the farmer handling the level prairie or the worn areas of the rolling prairie the use of 100 to 200 pounds of steamed bonemeal or 125 to 225 pounds of acid phosphate before wheat will usually bring good net returns. A highly phosphatic mixed fertilizer such as one containing 2 per cent nitrogen, 10 to 12 per cent available phosphoric acid and 2 or 3 per cent potash applied at the same rates as the bonemeal, or the same fertilizer with the nitrogen omitted, will also give good results. The scarcity of potash caused by the war will, however, prevent the profitable use of fertilizers containing over one or two per cent of this element this season.

In general phosphates pay best on wheat on this land and the fertilizer applied should contain a high per cent of rather soluble phosphates. The nitrogen and the potash do not seem to bring such good net returns on this land and they should be in small quantities in the mixture if at all. The more worn the land the more important is the nitrogen and potash in the fertilizer. On the better phases of the prairie phosphates alone, particularly soluble phosphates, will usually prove most remunerative.

M. F. Miller,
Agricultural Experiment Station,
Columbia, Mo.

SOME SUGGESTIONS FOR WHEAT GROWERS

It is surprising how little interest the average man takes in the use of better seed as a means of increasing the yield of wheat. But there is just as great possibilities along this line for improvement of the wheat crop as there is in selecting seed corn, seed potatoes, or any other kind of seed. Hundreds of men go into the field in the fall and carefully select their seed corn ear by ear, then put it away in a safe place and again go over it in the spring discarding all undesirable ears before planting. A dozen ears will plant an acre and hence the job is not a very big one even though a man has a hundred acres to plant.

For the average man it may not be practicable to go into the wheat field and select a head at a time and then cull out the poor grains, although that is not such a big job, at least to get enough of the best heads for seeding an acre or so, but no wheat grower should think of sowing wheat that has not been selected by a good wind mill. It is better to grade the seed by wind than by screen because it has been proved beyond controversy that the heavy, plump grains germinate better, produce stronger plants and consequently larger yields. There is an advantage, however, in the sieve selection. The California station says, "the main influence of large grains selected by simple sieve grading will be in giving the plants a more vigorous start in life, which of itself is of extreme importance. It has been shown that, in general, the more vigorous plants (that is, those having the largest spikelets) contain the larger grains, so that even in selecting the grains by simple sieve separation the bulk of the larger grains would come from the more vigorous plants, and thus there would be, in a measure at least, a selection from vigorous plants."

Another important advantage in using the fanning mill for cleaning the seed wheat is in getting rid of weed seeds, cheat, and other adulterations. Every neighborhood, at least, should have a good seed cleaning mill and on farms where very much small grain is raised it will pay the individual farmer to own one.

At the Kansas station a test was made by separating the grains of wheat in the same heads in two classes—those heavier than the average and those lighter than the average. In every hundred grains of the heavier kernels approximately 99 per cent germinated while in the lighter grains the percentage was about 2 per cent lower. If there was no difference in the vitality of the plants produced from the two classes the difference in germination alone would pay for the cost of running the seed through a good fan-mill.

On account of the good wheat crops for the last two or three years many farmers have fallen into the mistaken practice of following wheat with wheat. This is a bad practice for several reasons but particularly because of the better chance it gives wheat insects to multiply and increase their damage. We know of no better practice than to seed the wheat ground to clover or a mixture of clover and timothy and should the seeding fail to stand the timothy can be resown in the fall with about equal chance of success.

Many farmers made the mistake last year and possibly every year of breaking the ground late, perhaps turning under a heavy crop of weeds and sowing the wheat on the land without thoroughly pulverizing and firming the seed bed. Under such conditions the wheat will freeze out much worse, the plants will make much poorer growth and in at least nine cases out of ten the yield will be much less than on land plowed early and well prepared.

The man who sows only twenty-five acres of wheat—about the average acreage—and who increases the yield five to ten bushels per acre by using these suggestions will have a better profit for the extra labor than for most profit for the extra labor than most

Wheat on the soil experiment field at Hurdland, Missouri. The plot on the left received a complete treatment of fertilizer and lime with special legume crops grown in the rotation. The yield was 21.2 bushels per acre. The untreated plot on the right yielded 13.1 bushels per acre.

Every reader of The Missouri Farmer should not fail to read the opening chapters of "The Plunderer"—the great serial story which begins in this issue of the paper.

RENEWING THE PASTURE

The pasture is the backbone as well as the foundation rock on which our live stock industry is founded. In the early pioneer days the farmer never had to conserve pasture for his horses, sheep and cows. They roamed the forest, hills and valleyes in search of fresh and succulent herbage. When pasture became scarce in our own far west, the stock man moved his herds and flocks from place to place —as did Abraham and Lot of old—in search of new feeding grounds. Grass was abundant then and land was to be had for the taking, but these conditions have gradually changed. Farms took the place of vast forests and wide prairies. The nester with his plow invaded the ranches. Vast pasture lands became corn and wheat fields, gardens and orchards.

As the land increased in value, the pasture fields became smaller and smaller. The best land was put under the plow and the poorer land was given to producing pasture for the live stock. Even today, we, as farmers, have not gotten rid of the idea that our pastures do not need attention and we are slow to act on the idea that a little time and money spent on cleaning up the pasture field, reseeding and feeding the grass will give us good returns. The facts are that good returns may be secured if a little care and attention is given the pasture. On our own farm we make it a point to run the mowing machine over the pasture fields after harvest. The hay mows are swept out at least once a year, the feeding alleys and mangers three or four times a year and the seed and chaff hauled out and scattered over the thin spots in pasture fields. As often as possible a light coating of manure is put on the poorer portions of the fields. We feed the corn fodder and an occasional stack of hay or straw on the parts of the field where the soil is thin or is in need of organic matter. If the sod gets thin it will also pay to sow a mixture of clover, bluegrass and timothy. This may be done by hand and harrowed in or put on with a disk drill. The disk drill is a good tool for doing this work as fertilizer may be put on at the same time.

Many farmers in this country have been using fertilizer on their grass the last few years with good results. Far more has been done along this line in Europe. The Rothamsted Station in England has proven conclusively that available plant food in fertilizer will give good results on grass. It also discovered that a fertilizer high in nitrogen increased the amount and per centage of non-leguminous or the pure grasses while a phosphoric acid and potash mixture increased the percentage and amount of legumes. A number of experiments in various parts of England and Scotland as well as on the Continent gave essentially the same results.

Joe Wing in his book "Meadows and Pastures" says that the pasture fields can be reseeded for an average of about one dollar per acre. The work that we have done on our own farm convinces us that it is profitable to give some care and attention to our pasture fields. While a thorough reseeding and feeding of the pasture with available plant food will undoubtedly cost more than one dollar per acre it will pay to give many of our fields this treatment.

The reseeding had best be done in early spring and acid-phosphate, or a complete fertilizer applied at the rate of 200 to 300 pounds per acre. If we expect to depend much on pastures in the future we must make them produce better than they do at present. It will be necessary to reseed them, cut all weeds and brush, give more attention to the time and method of pasturing them, and apply available plant food through manure and fertilizers.

J. W. Henceroth.

LIME AND INOCULATION

"Say, Mr. Crawford wishes to see you; he is down at the crossing now," was the call that came to me as I was waiting for the electric car to stop one evening.

I started down the track afoot as the roads crossed only a quarter "Yes, I want to see you about my alfalfa, and would like to have you come over and help me out if you can."

So arrangements were made for me to go over the first day that work in the fields was halted. As I swung on the car steps he remarked, "that there might be some other things at his place that I might be interested in."

We had not long to wait until there came another rain that ended field work for a few days, so mounting a horse I started across country to his place. His place is not unlike the surrounding farms to the passing eye —gentle rolling prairie that is typical of northeast Missouri. It showed no signs of special handling. Wheat near the road was no better than some other pieces that I had seen that day.

"Yes, Mr. Crawford is at home, you will find him at the house." I was told by one of the men on the farm.

Dinner was soon over and across the pasture we started to the alfalfa field. There we found 12 acres, that showed signs of hard cropping previously. The soil was of a rather compact nature with fairly good surface drainage and in places the clay that underlies had worn through.

This is the history of that field. Last August it was plowed 12 inches deep with a disk plow, 1100 pounds of ground limestone and 500 pounds of high grade raw bone was applied per acre, and the soil worked down to the fineness of a garden.

Pure culture bacteria obtained from U. S. Department of Agriculture was applied to seed which was sown at the rate of 20 pounds per acre. Care was taken to follow the seeder closely with the harrow, so that this delicate, yet all important bacteria would not be exposed to the rays of the sun long.

The alfalfa was then about knee high (the last of May) of a dark green color except in a few places which was still pale but thick—there was entirely too much of it. It would probably average a plant to every two square inches. There was no possibility of them spreading out and forming a large healthy crown as is essential to alfalfa. Upon careful examination small nodules were found upon the roots showing that inoculation had taken effect.

But the most interesting thing found was when we got the roots washed out thoroughly there would be dense masses of minute roots. Cutting through the center would reveal a small piece of limestone. Surely this must be great alfalfa medicine as those roots had searched for it like cattle for salt.

I am inclined to believe that if Mr. Crawford had applied one or two tons of limestone instead of a half ton that he would have been well repaid for his labor and cost of stone. At the rate of a ton per acre we are only adding one pound to 22 square feet of surface. Surely this can not be too much.

We believe that the best step at present is to cut it with a disk harrow so that it would only tear up about half of the surface, and then crossing it likewise. Thus cutting out about four-fifths of the plants so the remaining ones would have room to develop with vigor.

From the alfalfa we drifted to the cattle barn and silos where he had fed 50 head of cattle the past winter and produced 380 loads of manure which was returned to 60 acres of corn land. His plans are to develop his farm into a beef factory using corn —silage and alfalfa hay for feed.

"But wheat is essential in my scheme of farming," he says. "I must have bedding for my cattle."

Rarely does one hear this reason advanced in Missouri.

From the barns our path lead across a field where corn was growing upon a heavy coat of rye that was turned under for green manure. Mr. Crawford expressed its worth in a very concise form as follows: "I consider its worth three fold: 1st, it is worth all it cost to protect the soil from winter washing; 2nd, it is worth all it cost as a winter pasture crop; 3rd, it is again worth all it cost and more for green manuring."

Isn't such a crop worth considering when it can be produced at the off season of the year? I am sure that when we work out a permanent system of cropping this crop will claim its share of attention with perhaps a little winter vetch mixed with the rye.

Other things were discussed and the day quickly slipped by. Again I was in the saddle headed for home. On the way I passed a place where a gentleman has recently moved from Ohio, near Mr. Joseph E. Wing's home, that great alfalfa enthusiast. He is also attempting to grow alfalfa, but I fear he has not followed Mr. Wing's teaching in regard to lime and inoculation. He had sown in oats with fertilizer a year ago. His alfalfa was from a foot to knee high but very pale except in a few places where the soil was very rich. Whether it is strong enough to survive until it will be able to gather its own inoculation is a question that only time will tell.

Only a few days before I had the privilege of inspecting a field of sweet clover that was sown a year ago. It was not over a foot high, except in some places where there would be a patch two or three feet across that would be of a dark green color; such is the characteristic of this plant as we find it growing wild. Upon examination we found the same old story—no signs of inoculation in the yellow patches. I am convinced that the sooner we learn the importance of inoculation and learn to apply a little lime and phophorus the sooner will legumes grow in that dark green mass, storing additional supply of nitrogen in our soils for future crops, providing a protection against drouths, and last but not least, being a spot on the farm where the owner will point with pride for the large net return it has brought forth.

G. H. Morthland.

Be sure to read "The Plunderer" which begins in this issue. There isn't a dull moment in it from beginning to end. It is wholesome and not overdrawn. It records a struggle in which big and fearless men are contending with each other for mastery.

All out-doors invites your

KODAK

EVERYTHING that you are interested in is worth a picture. On the home place, at your neighbor's, at the picnic, on your fishing or hunting trip—wherever you go there are scenes and incidents that you can preserve for all time with the click of the Kodak shutter.

Ask your dealer or write us for a copy of "THE KODAK ON THE FARM," a beautifully illustrated little book that not only tells about the new things in Kodakery but shows as well, by attractive pictures, the pleasures and the *uses* of a Kodak on the farm. It is free for the asking.

EASTMAN KODAK COMPANY,
454 STATE STREET, ROCHESTER, N. Y.

TRIBUTE TO THE COW

Little do we realize the debt we owe the cow. During the dark ages of savagery and barbarism, we find her early ancestors natives of the wild forests of the old world. As the bright rays of civilization penetrated the darkness of that early period, and man called upon the cow, she came forth from her seclusion to share in the efforts that gave us a greater nation and more enlightened people!

For two thousand years she has shown her allegiance to man, sharing alike in his prosperity and adversity, responding nobly to all that was done for her, until through her development she became an idol of the people of her native country.

In 1493 when Columbus made his second voyage to America, the cow came with him—and from that time to the present day she has been a most potent factor in making this, our own country, the greatest nation, with the highest type of womanhood and manhood history has ever known!

Her sons helped till the soil of our ancestors and slowly moved the products of the farm to market. They went with man into the dense forests of the new world, helped clear them for homes, and made cultivation possible for the coming generation—and when the tide of emigration turned westward, they hauled the belongings of the pioneer across the sun-scorched plains and over the great mountain ranges to new homes beyond.

Truly the cow is man's greatest benefactor. Hail, wind, droughts and floods may come, destroy our crops and banish our hopes, but, from what is left, the cow manufactures into the most nourishing and life sustaining foods—and is she not life itself to the thousands of little ones stranded upon the hollow hearts and barren bosoms of modern motherhood? We love her for her docility, her beauty and her usefulness. Her loyalty has never weakened—and should misfortune overtake us, as we become bowed down with the weight of years, we know that in the cow we have a friend that was never known to falter. She pays the debt. She saves the home. God bless the cow—little do we realize the debt we owe her!—E. G. Bennett, State Dairy Commissioner in the 1915 Missouri Farmers' Year Book.

HOW THE COUNTRY CHURCH CAN HELP AGRICULTURE AND COUNTRY LIFE

The farmer, unless he is a very religious man, thinks the preacher is the laziest, the most thoroughly overfed and underworked brute in the community. I was reared on a farm. I am a graduate of the Michigan Agricultural College. I have taught school in the country. I preach in a rural community. I elect to do so because I think it is the best place on the footstool of God to invest a human life.

The first thing we did was to organize a Rural Life Progress Club No. 1. The purpose was five-fold. All members were to do something every year to improve the fertility of the soil; to improve the buildings upon the farm; to increase the quality of the livestock; to raise the standard of life and living conditions for the family, and to do something together to improve some community condition. One of the officers was a co-operative agent. When they came to that word co-operative agent, they asked: "What do we want with a co-operative agent?" I said, "We will elect him and put the harness on him and if he balks we will turn him out to grass. If we can hitch a load to him and get him to pull it then we will find out what he is there for." The organization has been running about two years. It has provided excellent social advantages, clean, wholesome and satisfying for the rural people. I have often gone down town Saturday night in our little village and counted as high as 120 automobiles. The young people had come to town. They were simply walking up and down the streets, going into billiard halls and places like that. They were getting nothing socially and intellectually.

The Farm Is Worth While

We did not contemplate any such social development as has arisen. We were to hold our meetings every two weeks during winter but no meetings during summer. Those farmers became so interested that they hold a social gathering once every month. I want to tell about the last meeting. Bryan had just resigned. Some of our college students had just returned. The hay had not been put in the barn. A cafeteria lunch was served by the ladies. About 182 people had eaten supper. The students sang college songs. The other younger people were joining in. Outside they were playing, old men, and middle aged men and women. I counted about 56 playing one game. Men were discussing the resignation of Bryan. A little boy stood there with his mouth opened. He is in part a cripple. I said: "Warren, what were you thinking about?" He said: "I was wondering if I could ever do anything that would lead the people to discuss whether I was worth while or not." There out six miles from town men were discussing intelligently the very questions that were being discussed by the most cultured all over this land. I said to the ladies: " It is very generous to serve these people the way you do." Said a lady, who has five children: "We are glad to do it. We feel the farm is worth while and the best place to rear our boys and girls." She has a son who will be a sophomore at the University of Illinois this fall in agriculture. What I am saying is this: That is satisfied people socially.

We had a high school, not accredited. So I began politically in the town to agitate for an accredited high school. Some of those old fellows in the town thought it would increase the taxes. I said: "I will keep my mouth shut. I will pull the strings." By and by we had three directors elected who stood for an accredited high school. We got the school on the list. Now we have one of the best accredited high schools found in a rural section anywhere in the state.

The Young Man Goes to College

The lady that I mentioned had a son attending our high school. He used to talk about school and tell me that he was going to be a farmer. One day he said: "I guess I will go to college." I said: "If you expect to be a farmer, go to the university and take the long course." He went down and took the four-year course, but he didn't conclude to do that until I assigned to him when he was to speak at one of our Rural Life meetings this theme: "The Use and Value of Limestone in Productive Agriculture." He stood up and talked without any notes, and they complimented him. He said to me: "Mr. Diehl, I believe I can talk in public. I am going now to the university and take the training and come back on the farm, and spend my life on the farm." He was at this social gathering. When we started home he said: "The University has made me feel what you tried to make me feel, that a man with some ability and some ambition finds scope for the use of that ambition and that ability on the farm. Now I am confirmed as never before, to come back and live on the farm." Now, there is a tremendous hook right here. It has been a sad thing for our entire civilization that our bright young men and young women have thought the farm the place only for mossbacks and fossils, and they have gone to the city. If we are ever to have a better type of agriculture we must have a better type of farmer. If you ever get a better class of farmers you must get the boys to go to agricultural colleges, and then not drift away to the city, but come back to the farm. They will know the things that ought to be done and be an inspiration and teach other boys who follow in their wake.

No Use for Book Farmer

We have in our county a splendid county adviser. There were people that didn't have any use for the book farmer. "No, sir, I know more about my farm than any county expert. I have worked for thirty-two years." "Well," I said, "you don't. Mr. Eckhardt can tell you more in one minute than you know or have come to know in respect to your farm in thirty-two years." When we got this society organized and Mr. Eckhardt came and told us how to use lime and rock phosphate, and the like, the fellows still said they didn't believe in him, but we got him down to one of our meetings and now there is not a man in that community that does not shout for him and his work.

A few years ago we didn't raise very much alfalfa in our section, and men needed alfalfa to feed their stock. They felt the value of it but a man wouldn't pay $10 or $15 a ton. He couldn't buy a carload. This co-operation agent found men who wanted alfalfa and sent for a carload. They liked that. One man wanted to put a little piece of ground in alfalfa, and Mr. Eckhardt said to use lime. The farmer said: "I can grow it without lime, but I only need five, or six, or ten ton, anyhow. I can't afford to go and buy a carload. They don't handle it here commercially." But men of that type went to the co-operative agent, and said: "We need so many tons." Then he ordered a carload. We have succeeded in getting something like twenty-five or thirty men to apply limestone in preparation for alfalfa who otherwise would not have done it. These men now instead of knocking alfalfa are boosting for it.

Friendly Co-operation

The farmers said that concrete was a good thing to use, but they hadn't any mixer. We have one there now that goes up and down the country and charges $5 a day. The farmers said: "Let us buy a mixer of our own." As a result concrete is being used three times more largely than before. Men come there and say: "Let me buy stock in the Club." We ask them why they want to join. "Oh, I want to get stock in that concrete mixer." Now, then, every time you put the right foundation, a concrete foundation under a building, or build a feeding place for your hogs or your cattle, of concrete, you have done something good for the neighborhood. Do you suppose they would kill that co-operative agent off now? Not a bit of it.

I kind of pity the poor farmer's wife. Frequently the farmer has all the good things, fine machinery and fine horses, and the poor wife gets along with poor conveniences in the house. One lady said: "Mr. Diehl, I want to thank you for starting this organization." I said: "Why?" She said: "I have wanted my pantry fixed up for years, and John wouldn't do it, but when they asked him if he wouldn't entertain the Club he said, "We'll have to fix up the pantry before we can entertain them.' He has gone to work and fixed the pantry from top to bottom." She told me that her work is easier and she enjoys it more. We are trying to make conditions better for the women. That is one thing that is being realized.

We Need Strong Churches

One lady said: "Now, that Methodist preacher is getting all the people down to his church. That will never do. He is proselyting." I heard of that and I said to the president: "You just tell them to keep that organization going for the good of the community. Never mind our people, and never mind me, and I will never come near, but you keep that thing going over there. It is a good thing for the community." He went back and told a great big broad shouldered farmer what the preacher said, and the old farmer said: "We will keep this club going. We will keep the preacher here, but we will take those narrow people and we will twist their necks." That was not a good thing to do. They finally settled down. They have got all those malcontents into the club again and at work. Who was responsible for that malcontent? This was a good work, but some preacher somewhere thought the Methodist preacher was getting too much out of it.

I want to tell you the church is here. The leader of the people is the preacher. The fact of the case is, the finest product in the soil is a human soil, and the church is here to share in its production, and the church will stay. They lament the fact that 1700 churches in the state

that used to be occupied are now empty. Why, it would be a great blessing if 1700 more of them were empty. ,We must build churches so strong that they can pay a salary sufficient to command an able preacher, and then he can make that an intellectul center that will lead people of capacity and power to stay on the farm, and in rural sections, and build the spirit of co-operation. When we have a little preacher struggling over here, and another one over there, one in a little church here, and another one there, they divide the community and instead of building the spirit of co-operation they make it impossible. Eliminate the small struggling churches and consequently the divisions that arise out of little religious differences that don't amount to the snap of the finger, and build strong, clean, social, intellectual and spiritual centers in a church, commanded by an able man who loves the people, who loves the country, and who can talk in terms of agriculture, and isn't ashamed to do so.—Rev. W. W. Diehl, in an address before the American Bankers' Meeting, Chicago.

HOW TO GET RID OF HOG CHOLERA

J. W. Connaway, D. V. S., M. D., Veterinary Department, College of Agriculture and Experiment Station, University of Missouri.

[This article is a continuation of the articles in previous issues and will be continued until the whole subject of hog cholera control is thoroughly discussed. We suggest that every swine raiser who reads The Missouri Farmer should file away all these papers containing this article and they will then have the most valuable treatise on hog cholera that has been published.—Editor]

Simple, practical measures of prevention can be applied that will obviate, to a large extent, the dangers mentioned, if the shipper, railroad man and consignee will co-operate: (1) to prevent the shipment of hogs, for feeding purposes, from infected yards and farms; (2) and see that they are not collected in infected shipping pens; (3) nor shipped in cars that have not been properly disinfected; (4) and not unloaded enroute in infected feeding pens; (5) nor in an infected pen at the terminal station. And all this can be done without much expense. The money saved through the prevention of cholera will meet the expense many times over. The disinfection of a stock-car is not an expensive nor difficult task. Caustic lime (freshly slacked) and Compound Cresol Solution are cheap and efficient disinfectants and are easily applied.

If lime is used it should be sprinkled freely over the floor of the car before the removal of any manure or bedding. Water should then be sprinkled over the lime and litter, and the whole scraped up and removed from the car. This manure and litter should be dumped in some protected place where hogs cannot come in contact with it; and where it can lie a few days to heat, after a further application of lime. After the car has been made tolerably clean with shovel and broom, more lime should be scattered over the floor, and moistened by means of a spray pump or sprinkling can. And the walls of the car should be sprayed or mopped with a hot lime-wash made by adding unslacked lump lime to a bucket or tub of water. A handful of salt dissolved in each bucket of water before adding the quick lime increases the efficiency of the solution. A car thus cleaned and disinfected will carry hogs from one part of the state to another without danger of infecting them with cholera. The car should be properly bedded with clean straw. Ordinarily a bushel to a bushel and a half of quick lime will be sufficient to disinfect a 36 foot stock car with floor space of 300 sq. ft. And the cost of the lime will not exceed 50 or 60 cents. And even if it should require a full barrel, its use would be a wise precaution, as insurance against the loss from cholera of a good part of the shipment; and against spreading the disease to other herds.

If the Cresol Compound (Liquor Cresolis Compositus) (U. S. P. formula) is used it should be diluted with water to make a three or four per cent solution. One gallon of the undiluted solution will make up 33 gallons of a 3 per cent solution; or 25 gallons of a 4 per cent solution. Sprinkle or spray the litter and dung thoroughly with the disinfectant before scraping it up and removing from the car. Then spray and scrub the floor, and wash down the walls of the car with the same solution.

For the disinfection of stock cars used for **interstate shipments** of swine the regulations of the U. S. Bureau of Animal Industry specify the use of "4 ounces of Cresol Compound U. S. P. to each gallon of water." That is a 3 per cent solution. They also advise the addition of 1½ pounds of lime to each gallon of the diluted solution, to show where the solution has been applied. (See Amended order 210, effective Feb. 10, 1915). The Government regulations referred to do not require that the litter and manure shall be disinfected before removal from the car. This may not be so important at the large market centers, and especially where there are "reducing plants" for incinerating the litter and dung, from the cars and stock yards. But at shipping stations in the rural districts ,the litter and manure should always be well mixed with a good disinfectant before removal from the car. Such a precaution will aid in keeping cholera away from the farms in the neighborhood.

As already mentioned, carbolic acid and most of the coal-tar stock dips are less efficient for the purpose of destroying hog cholera infection than the Cresol Compound Solution. The market price of the undiluted liquid is about $1.25 per gallon.

The local stock-yards: It is a matter of much importance in the control and eradication of hog cholera to maintain sanitary shipping yards in the farming districts. And this is not an impossible task, nor expensive, if the work is properly apportioned. An attempt is being made to solve this problem in the counties that have organized anti-hog-cholera clubs. Proper care of the healthy and sick herds on the farms, by methods already recommended, will lessen the opportunities to carry infection to the shipping station. The shipments of sick and dead hogs is illegal, in some states, and should be made so in all states. It would work a great hardship, however, if swine raisers and feeders were not permitted to ship healthy "exposed" hogs that have not developed symptoms of the disease. But such hogs should be hauled to the station in tight-bottom wagon boxes, and should occupy a special pen at the stock yards while awaiting shipment. And a separate chute for loading should be provided. A slight readjustment of existing stock pens can be made at small cost that will meet the requirements. The spraying of hogs with bad smelling chemical disinfectants when these hogs are destined for immediate slaughter is objectionable. It is therefore all the more desirable that exposed hogs, though healthy, should be provided with a separate pen; since the hair, skin, and feet of these hogs may carry infection, from the cholera infected farm, to the local stock yards. It also happens that in separating the apparently healthy hogs from an infected herd, for shipment to market, a few hogs that are not visibly sick may develop symptoms of illness before they are loaded on the car. The excitement and fatigue of the infected animal, caused by the handling and hauling from the farm to the shipping station, often hastens the development of the cholera symptoms, and a hog that was thought to be healthy when it was hauled from the farm, may prove to be affected with cholera. These acute cases of cholera are liable to badly infect the local yards, if the affected hogs have access to the general pens and alleys; while if put in the special pen for "cholera exposed" hogs, the danger of spreading the disease to other farms would be greatly lessened. Farmers from other neighborhoods would not run so great a risk of carrying the cholera infection back to their frams, by contamination of their shoes with mud and dung from cholera infected pens. The cholera virus would be confined to a smaller space, where it could be destroyed at less expense and labor. A cement floor in this pen is desirable, to facilitate the cleaning and disinfection. And it will pay any farming community to put it in. Two or three good sized fat hogs will pay the cost. In fact it will pay any farmers' club, or "anti-hog-cholera club" of 25 or 50 members, who use the same shipping pens, to put concrete floors in all the pens at their own expense, even if the railroads would not bear a portion of the cost. The loss from cholera to individual farmers have in many instances exceeded the cost. And infected shipping yards have often been the source of the trouble.

The railroad industrial agents of a number of roads have shown an active interest in the hog cholera eradication work as outlined herein. And in Knox County, where through the University Agricultural Extension Department,

(Continued on page 9)

Special Avery Tractor Announcement

We announce cash prices for 1916 on Avery Tractors as follows:

3-Plow Tractor $ 760 5-Plow Tractor $1680
4-Plow Tractor 1120 6-Plow Tractor 2145
8-10-Plow Tractor $2475

We also announce two new sizes of Tractors —a 2-Plow Tractor which will sell for not over $550 cash, and a 1-Plow Tractor to sell for $195 cash.

7 Sizes — Fit Any Size Farm

There's a size Avery Tractor for any size farm. 7 *sizes. Fit any size farm.* They are light-weight, durable, simple and powerful. Avery plows are the original "Self-Lift." There are more Avery "Light-Weight" Tractors and "Self-Lift" Plows in successful operation than any other make. Introduced by "Sold-on-Approval" policy. Backed by strong warranties.

Now Is the Time to Start Tractor Farming

Now is the time to sell horses. Don't feed your crops into idle surplus horses through the winter. Now is the time to get a tractor for doing your plowing, discing, harrowing, ensilage cutting, threshing and other work. It will save you expense and hard work and make you more money by raising bigger crops. Call on any Avery agent, branch house, jobber or home office, or write for complete Avery Tractor and Plow Catalog and get ALL the facts about Tractor Farming with an Avery "Light-Weight" Tractor and "Self-Lift" Plow.

Avery Co. 1361 Iowa St. Peoria, Illinois

Thresh With an Avery Separator and Save Your Grain

Avery Grain Threshers are built for use with Avery Tractors in all sizes from 22x36 to 42x70 inch. Equipped with guaranteed non-breakable razor-steel cylinder teeth. Proven by field tests threshing on canvas to be the best grain saving threshers built. Every one is given a running test at the factory before it leaves which insures satisfactory results from the start. Backed by the strongest warranties ever given on a threshing machine. Satisfaction guaranteed.

Avery "Yellow-Fellow Grain-Saver" Separator

We'll Ship You This KRAMER ROTARY HARROW PLOW ATTACHMENT

10 Days FREE Trial NO MONEY DOWN

FREIGHT PAID

HARROW AND PLOW AT THE SAME TIME

Hitch a KRAMER ROTARY HARROW behind your plow for 10 days at our risk and let it harrow each furrow as it is being turned over. We want you to see for yourself how it pulverizes and levels the ground in one operation, preserves the natural moisture in the earth. The discs revolve in dust proof bearings making only ten pounds extra draft per horse by actual test. No exra horses needed. Can be attached to any sulky, gang, or steam plow—right or left hand plows. Adaptable to any soil. Adjustable to any depth. If at the end of ten days you are not fully satisfied, if the Kramer does not do all we claim for it, send it back at our expense.

Send Today for Our Freight Paid Offer!

We want to prove to you on your own farm that the **Kramer Rotary Harrow** is a money saving, money making investment for any farmer. Pays for itself many times over in one season by increased crops and time and labor saved. Write at once for **Free Illustrated Folder** and **LIBERAL FREIGHT PAID 10 DAY FREE TRIAL OFFER.** Our extra low prices will surprise you. SEND TODAY FOR FREE TRIAL.

KRAMER ROTARY HARROW CO., 145 Main Street, MORTON, ILL.

Attend On Credit

Fit yourself for a successful business career. Every branch is thoroughly taught by a faculty of 26 specialists. **Four** big buildings, 1,400 students annually, College Band, Athletic Park.

Pay us when you are employed and if we don't secure you a position, you owe us nothing. It is a liberal offer to earnest young men and women who are anxious to fit themselves for life.

Write for catalog.

CHILLICOTHE BUSINESS COLLEGE

2882 Monroe St., Chillicothe, Mo.

THE MISSOURI FARMER

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

Vol. VII August 1, 1915 No. 15

William Hirth - - - Publisher
Geo. B. Ellis - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year In Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct, always inclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

SEED CORN FOR 1916

It may seem a bit early to be talking about seed corn for 1916 but there is an unusual condition existing throughout the northern part of the Corn Belt which includes some parts of Missouri which calls for a little extra precaution in providing next year's seed. The season has been so cool that corn has not made the usual rapid growth and that will cause the corn to ripen somewhat later than the average. Then there are a great many thousands of acres of second and third plantings of corn that is very late. Now if our season is shortened by an early frost, which is not at all improbable, a lot of people will be hunting seed corn next spring.

Last year the corn matured unusually well and where farmers have a pen of good sound old corn it will be a good idea to select from it a sufficient amount of seed for next spring's planting. Old corn, when kept thoroughly dry, is very satisfactory for seed, and if it is not needed there is not much loss of time anyway. Without good seed there can not be a full crop and this should be the first consideration of every crop planted.

FAIRS ARE EDUCATIONAL

We do not know where a man can go for one day or a week and learn more that will be helpful to him on the farm than to go to a good agricultural and live stock exhibition. Besides a large number of county fairs we will have in Missouri this year three fairs affording the people of every part of the state ample opportunity to see the best that is produced of crops, live stock and machinery.

The first of these fairs to be held will be the Missouri State Fair beginning at Sedalia, September 25 and ending October 2. In the first place every farmer and his family need a little outing every year and there is no better time of year to get it than about that time of year. The visit and interchange of ideas with the farmers of different parts of the state ought to give any one something of great value on new crops, new methods, improved breeds of live stock and the latest patterns of farm and household machinery. Farm machinery has been a wonderful factor in lessening the hard labor of farm life both in the house and in the field and such rapid progress has been made and is being made that it is necessary for a farmer to occasionally visit some place where all the latest and best machines are to be seen together in order that he may know what to buy when he gets ready for something. It just makes a man a little broader and less selfish to see what other people are doing.

After the state fair follows the American Royal at Kansas City, October 5 to 9 and the new St. Louis fair to be held the same week. The American Royal in the past has been equal to the best in America in its exhibit of fine live stock and the people of this state are fortunate to have the opportunity of seeing as good cattle, hogs and sheep and horses as are to found anywhere in the world.

The old St. Louis fair in its former days was one of the great fairs of the country but it was allowed to degenerate into an immoral beer garden and horse race affair and it went down for lack of support of the better class of people. It is announced that the fair is being organized this year on a high moral basis and as the board has selected for its manager Jno. T. Stinson, formerly Secretary of the Missouri State Fair this ought to assure a high class exhibition.

Our readers should make a note of these dates and arrange their farm work so as to attend at least one of these fairs.

THE FARMERS' INSTITUTE

Every community ought to hold at least one meeting a year for the discussion of community problems and there is no better time of year to be thinking about such a meeting than right now. We like the plan of having a club in the school district which holds meetings monthly, or oftener, and in all such districts it is a good idea to hold at least one rousing big meeting a year and get up enough interest to get all the people of the neighborhood out to the meeting—even the skeptics and moss-backs. We think there have been more home and farm improvement clubs organized within the last two years than in any like period in the history of the state and they are doing good. One of the most apparent improvements resulting from these clubs is in the remodeling and refurnishing of the old school houses. Such improvements are followed almost invariably by better schools because when the community is aroused to the point of providing better equipment and buildings there is going to follow a demand for better teachers and better work in the school.

There is plenty of material in any neighborhood in this state to hold a profitable farmers' meeting but occasionally, once a year at least, it is best to call on the state board of agriculture for some outside help. No one can listen attentively to Sam Jordan or Kelly Wright for an hour without having just a little higher opinion of the business of farming than he had before. If it is practical information about some live stock subject you can get the best of a life-time experience from W. D. McKee in a day's time. And in like manner B. P. Smoot will enlighten you on questions of soil fertility and Miss Babb Bell will help the women in a lot of those little perplexing questions about household affairs.

Every live community should hold a farmers' institute this fall and if not already organized for club work that will be a good time to start such an organization.

FALL AND WINTER PASTURES

The first step toward better profits in farming is to reduce the cost of production to the lowest limit. When the cost of production goes up and the price to the consumer is made higher the buyer reduces his purchases and that, of course reaches back to the producer. We know of no other one thing that will reduce the cost of live stock production so much as an increased use of forage crops and this is particularly true of crops that will produce late fall and winter pasturage.

This year there are a great many thousand acres of land that have failed to produce a crop. These acres are now covered with a rank growth of weeds and summer grasses and the turning under of these green crops while they are full of water will cause them to decay quickly and will add a lot of available fertility to the soil. When wheat is one of the crops in the farm rotation this makes a good chance for a wheat crop that is if the weeds are turned under while tender so they will quickly decay. But the point we want to make in this article is that all this land as well as all corn land that is reasonably clean of weeds should be sown in some crop like wheat or rye for fall pasture.

A field of wheat or rye sown the last of August or first of September will in ordinary years give pasturage enough for hogs, calves or other young stock to pay a good profit on the cost of seed and seeding. Then there is another advantage in the saving of the soil from washing during the winter and this is one of our greatest farm wastes. Then in the spring if the crop is not allowed to stand and mature it can be plowed under in time for a corn crop and that again will greatly benefit the soil.

"The Plunderer"

For some time we have contemplated running a good serial story in The Missouri Farmer. The old saying that "all work and no play makes Jack a dull boy" applies to all of us—and while this publication is primarily devoted to the dissemination of sound farming information, yet a little diversion now and then serves to take our minds off the dull grind of things for a few moments and makes us all the keener when we return to the sterner tasks. "The Plunderer" was written by Roy Norton, one of the popular present-day authors, and the book would cost you $1.50 at any news stand in the Country. It has recently been introduced into the moving picture world by David Farnham—an actor who appears only in things of high class and splendid dramatic interest. The story has to do with a western gold mine and from the opening chapter to the end it grips the attention of the reader in an intense and powerful way. While it has its share of the rough and uncouth, in the main its sentiment is splendidly wholesome, and no man, woman, boy or girl can read it without having a greater respect for clean manhood and womanhood when the end has been reached. We are supplying this powerful story at considerable expense and we hope it will be read and enjoyed by all our subscribers. A good way is to let someone read the story aloud to the whole family. In this way old and young will look forth anxiously to each succeeding chapter.

THE MISSOURI FARMER.

FARMERS MUST HELP THEMSELVES

In the last few political campaigns the different parties have done a lot of resoluting against trusts and all combinations in restraint of trade, and we want to ask our readers seriously "What has it all amounted to?" True, various suits have been filed, a few fines have been imposed and so far as we can see things are going along in about the same old way with the "big interests" tightening the rope little by little about the people's throats. We can not hope for much relief until the laws and the courts are backed up by a better public sentiment and a closer co-operation of both producer and consumer. The most infamous of all combinations so far as farmers are concerned is the combination of packers which has absolutely at its mercy the control of the markets for every hoof of cattle, hogs and sheep produced in this country. And not satisfied with the control of the markets for meat animals and the sale of meats they have been reaching out for the last few years to get control of the poultry, egg and butter trade and they now control a very large part of that business.

It was recently announced in the public press that the agents of the U. S. Government had discovered that the oleo manufacturers had defrauded the government out of several millions of dollars of revenue—revenue the law requires to be paid for the manufacture of colored oleomargarine. It is always the little fellow who gets caught, but it is well known to the officers who have charge of the enforcement of our oleo laws that these little fellows are only the tools of the big packers who are back of the oleo business.

These greedy gouhls of society who have piled up their hundreds of millions from illegal profits on the farmers' cattle, hogs and sheep are now using their power which their immense wealth gives them to take more tribute from the farmers' wives of this country by getting control of the trade in butter, eggs and poultry.

There is hardly a shipping station of any consequence in this state, and the same condition exists in other states, but what you will find a cream station controlled by the trust, and an egg and poultry buyer controlled in the same way. The local buyer may be doing business in his own name which as a matter of course they all do, but the price he pays Mr. and Mrs. Farmer is fixed behind the curtain and the dealers dare not deviate one penny from it.

What are we farmers going to do about it? The progress we are making through legislation and the courts is slow, but we should not relax our diligence in that direction. We should keep a closer watch on our public men and not allow them to play both sides of the game, but that is a story too long for this article. One other thing we can do and our strongest weapon if we will use it intelligently is to market our stuff through co-operative societies managed and controlled by the producers and consumers. If the farmers of Minnesota and Wisconsin can build silos, big barns and fine houses out of the profits of co-operative creameries why can not Missouri farmers do the same thing?

What we need to do just now is to get behind the efforts of our state dairy commissioner, E. G. Bennett, in his efforts to organize co-operative creameries all over Missouri. The packers can beat us on any ground if we work single handed, but if we can get the farmers to stand together we can face them with an army 275,000 strong in this state that will drive our enemies to the wall. It is time for farmers to help themselves.

TO GET RID OF HOG CHOLERA

(Continued from page 7)

and the County Farm Bureau of this county, a series of meetings was recently held, and sixteen anti-hog-cholera clubs organized, the Superintendent of traffic of the Santa Fe R. R. issued instructions to the local agents to co-operate with the University and the Farm Bureau, and **to keep on hand a sufficient quantity of quick lime for the purpose of maintaining sanitary stock pens.** The farmers and shippers belonging to the anti-hog-cholera clubs, co-operating with the County Farm Adviser, will attend to the disinfection at sufficiently frequent intervals. In Johnson, Dade, Bates and Cass counties where a large number of farmers have also organized "anti-hog-cholera clubs," the local agents of the railroads have shown a ready willingness to co-operate with the clubs and to do all they can to help keep the local stock yards free from hog cholera infection.

(Continued in the next issue)

BUCKSHOT BY THE PROFESSOR

The "I'll try" of some men means a lot more than the "I will" of others.

What we need is not a "back to the farm" movement but a "stay on the farm" movement.

I guess this grand opera business may be all right but as for me, give me an old-fashioned circus with lots of "ellephunts" and clowns ridin' backards on buckin' mules.

I welcome the advice and help of any business man who sincerely wishes to aid the farmer—but I want to know that he is on the square and that he isn't trying to grind a selfish axe.

Old man Huerta's in jail down in Texas along with a lot of other horse thieves. But then the horse thieves can't help it. The law doesn't allow them to be particular about the kind of company they keep.

I am in favor of being prepared for war but I am not in favor of turning this Country into a military camp—of paying more attention to the science of killing people than we do to the science of farming and commerce.

If the angel Gabriel should go through the pockets of every old geezer who tries to break into heaven wouldn't he find a pile of plugs of "Horse Shoe," "Star," "Granger Twist" and half filled bottles of "Pizen?"

The average Missouri mule who is knock kneed and spavined these times is a mighty lucky dog. It means that he can keep on fighting Missouri flies and eating good old Missouri bluegrass instead of having to help haul connons around over in Europe.

Here's a hint to a lot of you old skin flints: figure out your wife's next birthday or better still, your next wedding anniversary and when it comes, put your arm around her and slip a $20 bill into her hand and tell her to buy anything she would like—and when you see the tears of happiness spring into her eyes you will feel that you never did a better thing with that much money in your life.

Are you bothered with fleas? Well, here's a remedy that's guaranteed to kill them. Catch the flea, double its head under its wing and then wave it around in the air a few times. This will cause the flea to get so dizzy that it will remain perfectly still for a moment or two. Then hit it between the eyes with an axe or a sledge hammre. We have never known this method to fail to kill the flea.

If I owned a lot of good wheat I'd hold it awhile. There is strong evidence that the Allies in Europe are trying to buy wheat through certain prominent American grain manipulators and thus get it at their own figure. I wouldn't think of parting with good wheat at less than one dollar a bushel and the man who holds it a while is certain to get that and more. The war is becoming more bitter every day and I wouldn't be surprised to see wheat go to $1.50 per bushel before the next crop is raised.

Old "Josh" Simpson got into a peck of trouble the other night. He had been talking "fishin'" with the bunch down at the livery stable until almost midnight. He knew the old lady would "raise Cain" when he got home, so he tried to slip in the back way—and not being very steady on his feet and everything being pitch dark, he stumbled headlong over an old bee hive. Well, to say that those bees were "peeved" at being waked up in that rough fashion, at that time of night, is putting it mildly. They just piled onto old "Josh" and what they did to him was a plenty. To make matters worse, the old family dog grabbed him by the leg—and his wife, thinking the chicken thieves had broken loose, frantically called up the night watchman. Everything except the "swellin" has calmed down—but "Josh" has confidentially told his friends that if they should miss a few little innocent looking bees any time during the next month or so, not to be surprised. He says he likes sorghum molasses better than honey anyhow.

THE YOUNG FARMER'S CHANCE FOR SUCCESS

What chance has the young farmer of today who has little inheritance coming to him to ever own a farm?

Are we as a state, as a nation, to grow more and more into landlordism and tenantry or shall we become a people of home owners? These are serious questions, but life is full of serious questions and there are thousands of young farmers in Missouri as well as the surrounding states who are face to face with these hard propositions right now and the future of our country depends more upon how they solve them than it does on the maintenance of a big navy or a standing army to fight our battles against a foreign foe.

We showed in a previous article in The Missouri Farmer that it requires upon present valuations approximately seven thousand five hundred dollars to own and equip an average farm home in Missouri. This sum may look small to the banker or even to the well-to-do farmer who has seen his acres, given him by the Government, grow into a snug little fortune, but to the young man who is working for $20 a month it may look pretty big. We know a great many farm owners of today who were hired men forty years ago and we know some tenants and hired men today who were land owners forty years ago. So let us say to the young man who is now working for wages: "In spite of the higher price of land, the greater cost of equipment and the closer competition for farmers, the man who calls to his aid the better methods and improved machinery of the present day has about as good a chance to win as the young man had of a generation ago. But let no young farmer be deceived by thinking that systems of farming adapted to the virgin soils and easy-going life of a century ago will fit in with our twentieth century problems.

No young man should feel discouraged because he lacks capital. If he has a sound mind in a strong body he has all the equipment that thousands of the most successful farmers of today had to start with in the beginning of their career. All the wealth of the world has been created by labor and the young man who accepts the cold fact that no one is entitled to anything he does not pay for in some kind of service has laid the first stone in the foundation of a promising life.

The man who has capital can utilize it for buying land, and equipment and employing labor and if he has the business capacity he may succeed without doing manual labor himself. But for the fellow who has nothing but his labor to start with it is entirely a different proposition. About the first thing a young farmer should do is to fix his aim in life. In marking out a land it is necessary to set a stake at the other side of the field to keep your eye on and in planning a career on the farm it is essential to map out your course and then make every effort to keep to it.

The trouble with too many farmers as we see it is that they have no definite plan to work by. There is entirely too much haphazard, hit-and-miss work on the farm. The young man can do no better perhaps than to look about among the farmers he knows and study the methods of those who have succeeded and compare them with those who have failed. Take as an example the breeding of live stock. We know a number of men who have made enough to pay for a good farm out of a herd of pure bred hogs or cattle. But they are men who set their stakes ahead and then drove to them.

In orcharding, in dairying, in breeding good cattle, sheep, hogs and horses there are just as good openings today as there has ever been and the young man who will fix his whole thought on any of these lines and call to his aid the farm paper, the experiment station and the experiences of the best farmers will have as good a chance to succeed as his father had before him.

Thirty-Six Highest Awards
To International Harvester Machines

THE International Jury of Awards, at San Francisco Exposition, gave to the International Harvester exhibit thirty-six highest awards covering not only the Champion, Deering, McCormick, Milwaukee, Osborne, and Plano harvesting, haying and corn machines and binder twine, but also the newer lines—the oil engines and tractors, manure spreaders, tillage implements, farm wagons, corn planters, corn cultivators, feed grinders, and seeding machines.

This is a world's record. Never before were so many highest awards given to any one exhibition of farm machines at any World's Fair.

In 1851 the first reaper was exhibited at the World's Fair in London, and there received the Council Medal. Since 1851 it has been the Company's policy to exhibit and demonstrate its machines wherever the opportunity was offered.

Our exhibit at San Francisco in 1915 occupies 26,721 square feet of space, by far the most complete exhibit of its kind ever made. The thirty-six highest awards given to this exhibit constitute a splendid mark of approval for the good judgment of the hundreds of thousands of farmers who believe International Harvester machines to be the best the world affords.

Ranch Manager Wanted

Wanted, a manager for a splendid 800-acre ranch in Monroe County, Mo. Admirably adapted to live stock and crop raising. I want somebody to take charge of same and to a responsible party who can buy half interest in live stock and implements, I will give half the yearly profits. Mrs. Anna Mitchell, Monroe City, Mo.

Interested in a Gasoline Engine?

Those of our readers who are thinking of buying a gasoline engine this fall will do well to drop a line to the Witte Engine Works at Kansas City, Mo., and ask them for complete information on their big line of farm engines. Perhaps there are few farm investments that pay better than a gas engine which saves a lot of hard work every day in the year on every farm where there is water to pump, feed to grind, silos to fill, wood to saw—and a lot of other similar things which require power. The only reason why there are not thousands more gasoline engines in use is because few farmers as yet have been aroused to their labor-saving possibilities. We are standing on the threshold of a greater use of engine and tractor power on the farm than has been dreamed of heretofore and it will be well worth a postal card for any farmer to write to the Witte Engine Co. and get a lot of information which is free for the asking on this subject.

Farm Management

D. H. Doane, University of Missouri

The law of a worthy life is fundamentally the law of strife.—Roosevelt.

Whatever you may be sure of, be sure of this, that you are dreadfully like other people.—James Russell Lowell.

It is not too late to prepare your soil for some fall crops. Rape, rye and turnips can be counted upon. One principle of farm management is "keep busy." Now that the rush is nearing a close, what plans have you for utilizing man and horse labor?

Feeding Lambs

In another month you will begin to think seriously of the approach of your feeding lambs. Doubtless you planted cowpeas or soybeans with the corn and probably these crops have grown quite successfully. My observation this year has shown that the soybeans have done better than the cowpeas. This is probably due to the excessive cool, wet weather that we have had. The past has shown us that cowpeas have made the most successful catch crop in corn but I am ready to be convinced at any time and it begins to appear now that soybeans are going to take the place of the cowpeas, particularly in such portions of the country where the farmers think it necessary to plant their corn before the ground thoroughly dries up.

The satisfactory value of the sheep feeding proposition is found in the rape crop. An early frost is bound to force the marketing before your lambs are fat on the cowpea ground. They can be fed and finished if you have the rape. If you do not, they have to go to market frequently at a loss. Rape, under favorable weather conditions, will still make a fairly good growth if put on a well prepared seed bed as late as the 1st of August. Preferably it should be put in earlier and cultivated. It might be put on wheat or oat stubble. At any rate put it on a good piece of ground and if possible have plenty of it. The seed is cheap and you should have a little spare time to prepare for it now. Of course it is by far the best to have sown the rape early but the late seeding as stated before, under favorable conditions, will still make good.

The prospects are that fed lambs will be higher. In some sections of the country we have a most wonderful growth of catch crops and all of our farm management men know by experience that this is almost sure to mean a good profit. I would urge all intending feeders to get their oats in the bin early and be prepared to receive the sheep whenever the kinds wanted are available.

If we can be of any special assistance, let us hear from you.

Idle Work Stock

The rush of spring is over, corn is laid by, grain is harvested but I dare say that by far the majority of farmers still have enough work stock upon their farms to meet the demands during the rush season. How are you going to handle this really serious problem? Are you going to keep as many horses and mules as you need from now until next spring, equipped to have them on hand at seeding time nearly a year from now? Let me ask you frankly what does it cost you to keep a horse a year? Mr. O. R. Johnson of the farm management department here at the Missouri College of Agriculture, says that the average yearly cost on fourteen farms is $88.38, over 75 per cent of which is a feed cost. Let me urge this one point. Each man sit down and figure **now** how much it will cost him to keep his surplus work stock from now until he will need them again in the spring. After this figure is known, then find out what you could get for this stock and about what it will cost you to replace it in the spring. I believe that many of you will find that the best thing for you to do is to sell some of your surplus work stock. Figure it out and see how much of this year's crops will go to non-productive stock, such as work stock.

Crop Prospects

Some of the best corn and some of the poorest corn can now be seen in most any farm community. Sometimes fields have been entirely abandoned and I have been in some that gave promise to make 100 bushels to the acre. Such sights as these can be seen in an hour or two's drive through most any of our better farming communities. It appears that wheat yields are going to be somewhat disappointing. The loss is becoming so large on account of a large per cent of shriveled grain. This may be due to a great many causes. Fly, rust, and many think that the chief cause is the extreme rains at blooming time. Regardless of just what the cause may be, three to sixteen bushels per acre is the yield that I have been finding in most of the counties. Doubtless we have as good an oat crop as we have had in years. Another point of satisfaction, and this is, particularly gratifying in the light of results of the past three years, is to know that most all of the clover has caught this year. Some of the most beautiful stands that I have ever seen can now be found in oat and wheat stubble. All in all, we have every cause for rejoicing. Of course the loss is very severe in some localities and also on some particular farms but the sum total of our prospects at this date is far better than it has been for the last two years.

Vetch and Rye

I have just returned from Cooper County where I have had an opportunity to view some of the work that Mr. Wilson, our farm adviser, has been carrying on in that county. One thing that is particularly gratifying to him and that appears to have a brighter prospect before it, is a crop practically new to the community, namely, vetch. In some fields there will be three cuttings of this crop this year. The yields have been beyond expectation in practically every instance and in many cases it appears that a fair seed yields is yet to be obtained. If our central and southern Missouri farmers can count upon rye and vetch as certain winter cover crops and have crops for the next year, we have certainly great causes for rejoicing. These crops are particularly effective as cover crops and the combination, vetch and rye, makes a most excellent feed. Vetch is particularly high in protein and its growth, when it does well, is so abundant that yields frequently run over two tons to the acre. Vetch has also done exceedingly well in southeast Missouri in Scott County where Mr. Derr has been working with it. Mr. Cockefair in Greene County has also had excellent results. All in all it appears that this crop holds out no small amount of encouragement at this time.

Some Indirect Results Accomplished By the Farm Adviser

It is impossible to measure in dollars all the accomplishments of the farm advisers. Perhaps the greatest service of all is the indirect service, and this cannot be expressed in dollars or numbers. For example, it is difficult to place a value on the work with the young folks in their tomato, corn ,pig and poultry clubs; the class work in stock and grain judging, and the assistance given in the teaching of agriculture; the holding of "parents' and agricultural days" in the schools, which have tended to bring parents into closer touch with, and stimulate a keener interest in, the work of the school and the teacher. It is impossible to figure the direct returns from the holding of the movable schools of home economics in which many of the women were given their first lessons in the proper care and preparation of food, care of sick, rearing of children and the many suggestions for lightening of household and home duties. No figure will represent the inspiration received, often for the first time, at the more than 1000 meetings held and the 118,000 people reached. These instances and many more that are similar, must find their justification in the minds of the leaders and sponsors for the movement, they do not directly swell bank accounts or increase yield of corn, but they do build for a bigger, broader, and more satisfactory rural Missouri.

It will soon be time to sow wheat again and it is already time the ground was plowed. The experience of the best wheat raisers as well as the experiment stations prove that early plowing and thorough preparation of the seed bed will add from 25 to 50 per cent to the wheat yield.

THE CO-OPERATIVE CREAMERY

The scarcity of home-made butter in the markets is an indication that the people are finding a more desirable way of disposing of this commodity. And we have but to notice the increased number of cream cans handled at railroad stations and the increased number of cream separators in use, to be convinced that selling butter fat is fast becoming more popular than making and selling butter. Whether it is more profitable on an average to make and sell butter, when all the work connected with the making of good butter is considered, is an open question, even under the prevailing system of buying cream. When one sells butter fat they must know that whatever creamery manufactures it into a finished product make a profit, and some wonder how a creamery can afford to pay as much for butter fat as the grocer usually pays for finished butter. In the first place when the creamery buys your cream he pays for butter fat but the creamery's profit is in what is called the over-run or churn gain. That is, from 100 pounds of butter fat the creamery butter-maker usually gets 120 pounds of finished butter. This churn gain consists of moisture, curd, and salt. Oftentime people who have been making and selling their butter complain when selling their butter fat to creameries or cream buying stations, saying they do not get paid for as many pounds of butter fat as they have been getting pounds of butter from the same amount of cream. Where tests show an equal fat content, this, of course, is true, because the cream that is churned shows the churn gain, while that which is sold to the creamery or cream station is tested for the butter fat it contains and paid for on that basis. In many sections of the country where there are communities with sufficient cows farmers and dairymen operate their own creameries. The product of 600 cows will start a creamery on a good footing.

Usually an organization is effected and stock in the creamery is sold to those who furnish the raw material. The money received from the sale of stock goes to build and equip the creamery. Shares of stock usually sell at 50 to 100 dollars, depending on the size of the creamery wanted and the number of available patrons. When the creamery is completed the patrons, who are the owners, are paid or credited with the amount of butter fat in their cream. The butter is made, sent to market and the proceeds are prorated among those furnishing the cream less the expense of operating the creamery. These are co-operative creameries and when true loyalty exists, with good management and sufficient cows, they bring the producer the highest price for his raw material, if he is so situated that he cannot sell whole milk. It enables him to get the churn gain or over-run on the butter fat he sells and he cannot afford to make butter at home if he can patronize a co-operative creamery.

Creamery promoters have been active in Missouri to the detriment of the dairy industry. They usually drop into a place, organize a company, build and equip a creamery, selling it to the company at about double the cost of same, paying little or no attention to whether there are sufficient cows to justify a plant. In many instances creameries so promoted operate a short time and are closed down for want of patronage.

Communities that contemplate establishing a creamery should write the State Dairy Commissioner at Columbia, who will gladly visit such localities and if conditions warrant will assist in the enterprise without any cost. Beware of the creamery promoter.

E. G. Bennett,
State Dairy Commissioner.

BOOSTING FOR THE MISSOURI STATE POULTRY ASSOCIATION

The poultry industry in Missouri is growing faster than any other branch of the farm work at present, for people are beginning to realize that the revenue from poultry and eggs during the two years of dry weather has been a great help in paying the grocery and clothing bills, and in a majority of cases has also helped to increase the bank deposit.

The Missouri State Poultry Association has been able during its 23 years of active life to encourage the raising of better poultry and more of it by its annual State Poultry Show and by its influence in getting state appropriations for the experimental and educational work which is being done by the Missouri State Poultry Experiment Station.

The membership has increased during the past few years from hundreds to thousands and now hovers around the five thousand mark. By a little solicitation on the part of its members the membership can easily be doubled before our next show, which will be held at Joplin, December 7th to 11th.

The annual membership dues are only fifty cents and the year continues from time of payment, in place of having a financial year terminating on any certain date. The life membership fee is $5.

The members receive all of the bulletins issued by the Missouri State Poultry Experiment Station during the life of their membership, without having to write to Mountain Grove for each bulletin when it is ready for distribution. Non-members often miss receiving bulletins of great value through not knowing that such are available, and the information contained in any one of them is worth the price of a year's membership.

The Association also issues a year book containing the name, address and variety of poultry raised by every member, which as an advertising medium is worth several dollars.

By joining the Missouri State Poultry Association, each member helps to boost Missouri poultry interests, and in that way is helping to make conditions better. The increased profits resulting from a better understanding of feeding and housing conditions as explained by the experts at Mountain Grove has been the means of securing more conveniences in the home.

Missouri pure bred poultry is being shipped to all parts of this country and to numerous foreign countries, in competition with the best that is bred any where.

Missouri market poultry and eggs have been improved in quality and price by co-operation of members of this Association and the influence they have exerted in their communities.

If every poultry raiser could be listed among the association members, its influence would be far greater than at present and more good could be accomplished in getting better prices for both pure bred and market poultry, without increasing the cost of production.

The harvest season is a good time to renew membership or to join the association, so that everyone will be enrolled before the opening of the fall show season.

Mr. Fred Crosby, Mountain Grove, Mo., is Secretary- Treasurer, and will give prompt attention to memberships sent to him and to correspondence about any matter of personal interest regarding poultry problems.

Get a friend to join with you and send your application with money to Mr. Crosby today.

Do it now!

Fraternally yours,
(Signed) A. A. Coult,
Pres. Missouri State Poultry Assn.

Sunlight As a Germ Destroyer

Sunlight is nature's great germ destroyer. It is the cheapest disinfectant at man's disposal and should be taken advantage of at every opportunity.

"In the construction of barns or shelters for any kind of animals," says H. Preston Hoskins of the Minnesota College of Agriculture, in Extension Bulletin No. 44, "ample provision should be made for the admission of the maximum amount of sunlight. A southern exposure is desirable; that is, an arrangement by which most of the windows face south. The warmth thus provided in cold weather is desirable and much of the heat of summer can be avoided by the use of curtains or screens.

"Most disease germs are entirely killed by direct sunlight. This has been repeatedly shown by experiments."

The farmer should bear this in mind in building his barn, stable, hog house, or poultry house.

We would like to have the women write us their experiences in the use of labor-saving helps in the home.

MOSQUITO CARRIES MALARIAL FEVER

"In addition to being pests, many insects are carriers of disease," said Doctor M. P. Ravenel, professor of bacteriology and preventive medicine at the University of Missouri.

"Some insects, such as the ordinary house fly, act mechanicallly as filth carriers," continued Doctor Ravenel. "Other insects act like a syringe, mechanically drawing blood from sick persons and injecting it into other persons sick or well. This is also true for animals among which heavy losses are often due to bites of insects. Texas fever, which causes a loss to the farmers of the South and the cattle trade of at least $60,000,000 per year is carried by a tick.

"In man the most important disease conveyed by insects in Missouri is malarial fever. The germ, which belongs to the animal kingdom, is in the blood. The mosquito in biting draws the young parasites into its stomach where they undergo a stage of development which requires about twelve days. During this time they multiply enormously and finally reach the salivary gland of the mosquito. Then the bite injects the germ into the person bitten, and infection takes place.

"The breeding of the mosquito should be prevented. This insect always lays its eggs in stagnant water. These hatch and produce the well-known wigglers. Where the water cannot be drained, the surface of such pools should be covered with crude oil, which fills the breathing apparatus of the larvae and kills it by suffocation.

"In rooms where sick persons are kept all windows should be screened, or mosquito netting placed over the bed of the patient. The mosquito does not naturally harbor the disease, but must get the germs from a sick person.

"Those persons who are obliged to go into mosquito infected districts can protect themselves by the use of oils, such as the oil citronella and oil of penny-royal, which are repulsive to the mosquitos. It is also well to take quinine, if the district is known to be infected with malaria. The average dose should be five grains each day, but a physician should be consulted as to the amount to be taken."

Doctor Ravenel said malaria was very common a few years ago in Southeastern Missouri, but that it had practically disappeared where the lands have been claimed for cultivation.

"It is curious that people will do so much more for commercial purposes than they will for public health," said Doctor Ravenel.

THE WAY AS I HAVE TRAVELED IT

Not long ago a young lady said to me, "O, if I could have a nice house in the country, with running water, a furnace, electric lights, a bathtub and everything nice and convenient, I think I would like to live in the country, but to live as some do I think would not suit me."

That speech called for another, and I made reply that for twenty-one years I lived in a modest little home away out from town, on a farm. There was no running water in the house, and if we concluded we needed a bath we would go to the creek or washtub. We had no furnace, nor electric lights, but a big fireplace, and for many years the light was from the fireplace and the tallow dip, and later from the tallow candle. In addition to all these things, there were the loving, devoted parents and a big bunch of boys and a sister.

Ah, those days, could they only come again! If I could just for one night, if no more, cast aside the years and recall those fond parents and a brother from their eternal sleep, and gather together again the widely-scattered flock, just once more to surround the old fireside, in the modest but most happy home, or just once more in my little chamber have mother come again to see that I was safely tucked away for the night and as she departed to impress one more kiss from her loving lips upon my cheek!

Those were surely happy and carefree years, even though no bathtub, nor furnace, nor running water, nor electric lights helped to make the old home better.

For a few years I drifted then, often making home in some hotel or boarding house, where were sometimes bathtubs, furnaces or other conveniences, but this life in a few years grew so tiresome that I began to long for a home of my own.

I told a friend of mine how I was feeling about getting a home of my own, and she thought it a fine notion and quite the thing to do. So ere long with that same friend, the very best I have, we were located in our new home, a very modest little one with but three rooms, but no bathtub, nor running water, nor furnace, but full of the sunlight of genuine happiness. In due time the children came to add their sweet loving lives to help brighten ours and our happiness was surely complete. That little boy and that little girl were the sweet sunshine of our home for twenty-three short years, and I wish I could tell you how we loved them and could make those who do not know understand.

But now the children are gone and the old ones are alone, and you may not know how lonely we sometimes feel. It is true we live in a pretty good house now, with bath, furnace, running water and all other things modern, but the home is not what it used to be when the children were there.

Were you ever homesick—or lovesick? If not, I do not like you as much as I thought I did. I have had both troubles and the same fine girl has been the cure for both.

When I was traveling and would have to be away for a few weeks at a time I often became genuinely homesick. Now, when persons are homesick or lovesick they always want to write poetry—and some actually try it. You know how that is yourself, or I hope you do.

On an occasion when I was homesick and was to start for home the next day, I was riding that night on the train for the next town. The monotonous rumble of the train made sweet music, for it seemed that the whirling wheels were in a hurry to get me home. In a sort of "daydream" these words, "Just to kiss the sweet lips of my baby," came into my mind and I could not dismiss them.

I arrived at my hotel and retired, but could not sleep. "Just to kiss the sweet lips of my baby" made me see another picture, and I arose and wrote the following lines, which I named "The Homesick Drummer." It may not be worth while, but I shall repeat it to you as it was written.

THE HOMESICK DRUMMER

Like the wings of the wind we are hurried
Through city and hamlet and town;
With our grips and our baggage we hustle,
Meet the world with its smile or its frown.
The thousands we meet are all strangers,
Exacting their toll for each turn,
Till the heart grows weary with longing,
And for home and for loved ones we yearn.

Just to kiss the sweet lips of my baby,
Just to hear her dear prattle once more,
To hear her happy, sweet laughter,
When again I shall open the door.
To find my loved ones at the fireside,
My wife with our babes on her knee;
How sweet to end the long waiting
And watching and yearning for me!

How the heart overflows with its rapture
As loving arms round me entwine!
Our boy, my wife and our baby
Are all in the world that are mine.
You may have your gems of Golconda,
Or around the world you may roam;
You may have your granite-built mansions,
But for me, my loved ones and home.

—Sam Jordan before the Country Life Conference, reported by the State Board of Agriculture.

Softening Hard Water

There are various methods of softening hard water. If the mineral contained is only carbonate of lime, the water may be softened by boiling and letting it stand till the lime settles to the bottom. Boiling has no effect on other minerals usually found in the water and water containing them is said to be permanently hard. Probably the best alkali to use for softening water is washing soda, sodium carbonate, or sal soda, as it is sometimes called. It is best to make a solution of the washing soda by dissolving one pound of it in one quart of boiling water. This may be bottled and kept on hand to use as needed. Allow 2 tablespoons of this solution to every gallon of water to be softened. If lye is used, dissolve ¼ tablespoon in 1 cup of water and use this amount for every gallon of water. Use 1 tablespoon of borax dissolved in 1 cup of water for every gallon of water. A number of washing powders and preparations for softening water are on the market, but they are usually more expensive than the substances already mentioned, and are likely to be so strong as to injure the fibres of the garments washed with them. If washing powders are used they should never be put on the clothes dry or sprinkled carelessly into the tub. Dissolve the powder in a little water before the clothes are put in.—Babb Bell, State Board of Agriculture.

Little Talks to House Keepers

To launder embroidery, make a strong suds of a pure neutral soap and tepid water and wash the articles by rubbing and squeezing them in the hands. If the embroidery is in colors do not rub the soap directly upon it. Rinse quickly in clear tepid water, roll the article in a dry towel, and squeeze until all the water is out, then shake well and roll up in a dry towel until ready for ironing, which should be almost immediately.

One should have the ironing board ready before beginning to wash the article, so as to cause no delay. Make a thick soft pad by folding up an old blanket, and cover it with fine, smooth muslin. With a hot iron rub over this muslin cover until it is so hot that the hand can not be laid upon it; place the article to be ironed upon it, face down, and cover it with a smooth dry cloth; press with a mediumly hot iron until the article is nearly dry, then remove the cloth and the article, and once more iron over the muslin pad until it is very hot, replace the article and press until dry with a medium hot iron. Turn the article over and hold the iron close to the raised parts of the embroidery to dry it out. Keeping the muslin hot on which the embroidery rests brings out the lustre.—Annabell Turner, instructor in home economics, University of Wisconsin Extension Division.

Setting Colors in Cloth

Colors in washable clothing may be set before washing by the use of the following directions: For yellow, tan and brown fabrics, use a cup of vinegar to a pail of water. For blue, lavender and green fabrics, use an ounce of alum to a gallon of water. For blue, red pink and black fabrics, use a cup of salt to a pail of water.—Department of Home Economics, University of Nebraska.

International Harvester Manure Spreaders

"MOST machines handle crops—the manure spreader produces crops." There is a lot of food for thought in that sentence. When you have crops ready, you need machines for the harvesting, but before you can have crops you must have fertile soil. Your yields depend on how well you fertilize the soil.

In the choice of a spreader—your crop producer—you cannot be too careful. Avoid all chance of going wrong by choosing an **International Harvester** spreader—**Low Corn King, Low Cloverleaf,** or **Low 20th Century.**

I H C spreaders are built from careful designs based on rigorous field tests; strength in every part makes them last for years; they can be had with an attachment spreading 8 feet wide or more; they are low for easy loading; narrow for easy handling in yard, stable and field.

If your local dealer can't show you an **I H C** spreader, write us for our booklet "Why You Should Use a Manure Spreader," and when we send it we will tell you where you can see the machine. Don't buy until you have seen an **I H C** spreader.

The Plunderer

By ROY NORTON

Author of "The Garden of Fate"

CHAPTER I

BULLY PRESBY

Plainly the rambling log structure was a road house and the stopping place for a mountain stage. It had the watering trough in front, the bundle of iron pails cluttered around the rusted iron pump, and the trampled muddy hollow created by many tired hoofs striving vigorously to drive away the flies. It was in a tiny flat beside the road, and mountains were everywhere; hard-cut relentless giants, whose stern faces portrayed a perpetual constancy. At the trough two burros, with their packs deftly lashed, thrust soft gray muzzles deep into the water, and held rigid their long gray ears, casting now and then a wise look at the young man in worn mining clothes who stood patiently beside them.

Another man, almost a giant in size, but with a litheness of movement that told of marvelous physical strength, emerged from the door of the road house, and the babel of sound that had been stilled when he entered, but a few minutes before, rose again. He crossed to the well, and smiled from half-humorous eyes at the younger man standing beside the animals, and said: "Bumped into a hornet's nest. Butted into an indignation meetin.' A Blackfoot war powpow when the trader had furnished free booze would have been a peace party put up against it."

The younger man, who had turned to pump more water, following the polite mountain custom of replenishing for what you have used, stopped with a hand on the handle, and looked at him inquiringly.

"It seems it's a bunch of fellers that's been workin' some placer ground off back here somewheres"—and he waved a tanned hand indefinitely in a wide arc—"and some man got the double hitch on 'em with the law, provin' that the ground was his'n, and the sheriff run 'em off! Now they're sore. But it seems they can't help 'emselves, so they're movin' over to some other place across the divide."

"But what has that to do with us!"

"Nothin,' except that it took me five minutes to get the barkeep' to tell me about the road. He says we've come all right this far, and this is the place where we hit the trail over the hills. Says we save a day and a half, with pack burros, by takin' the cut-off. Says it's seven or eight hours good ridin' by the road if we were on horses and in a hurry."

He paused and scanned the hills with an observant eye, while his companion resumed the pumping process. The trough again filled, the latter walked around the pails and joined him.

"Well, where does this trail start in?" he asked.

"He's goin' to show us as soon as he can get a minute's rest from that bunch in there. Said we'd have to be shown. Said unless he could get away long enough we'd have to wait till somebody he named came in, and he'd head us into it."

They led the burros across the road and into the shadow of a cliff where the morning sun, searching and fervid, did not reach, and threw themselves to the ground, resting their backs against the foot wall, and trying patiently to await the appearance of their guides. The steady, hurried clink of glass and bottle on bar, the ribald shouts and threats of the crowd that filled the road house, the occasional burst of a maudlin song, all told the condition of the ejected placer men who had stopped here on their journey.

"I don't know nothin' about the case, of course," drawled the big man lazily, "and it's none of my funeral; but it does seem as if this feller they call 'Bully' is quite some for havin' his own way."

He laughed softly as if remembering scraps of conversation he had segregated from the murmur inside, and rolled his long body over until he rested on his belly with the upper part of his torso raised on his elbows.

"It appears that the courts down at the county seat gave a decision in his favor, and that he lost about as much time gettin' action as a hornet does when he's come to a conclusion. He just shows up with the sheriff, and about twenty deputies, good and true, and says: 'Hike! The courts say it's mine. These is the sheriffs. Off you go, and don't waste no time doin' it, either!' And so they hikes and have got this far, where they lay over for the night to comfort their insides with somethin' that smelled like a cross between nitric acid, a corn farm, and sump water. And it don't seem to cheer 'em up much, either, because their talk's right ugly."

"But I thought you said they were heading for some other ground?"

"So they are, but they're takin' their time on the road. I used to be that way till the day Arizona Bill plugged me because I was slow, all through havin' stopped at a place too long. Then, says I, when I woke up a month later in the Widder Haskins' back room: 'Bill, this comes from corn and rye. Never have nothin' to do with corn juice or anything that comes from a corn field, after this; or some day,when you hand ain't quick enough, and things look kind of hazy, some quarrelsome man's going' to shoot first and you'll cash in.' And from that day to this, when I want to go on a bust, I drink a gallon of soda pop to have a rip-roarin' time."

A man lurched out of the door of the road house as if striving to find clean air, and stood leaning against one of the pole posts supporting a pole porch. Another one joined him, coarsely accusing him of being a "quitter" because he had left his drink on the bar. They were stubbornly passing words when, from down the road, these came the gritting of wheels over the pulverized stone, and the clacking of horses' hoofs, slow moving, as if being rested by a cautious driver along the ascent.

The man by the post suddenly frowned in the direction of the sound, and they whirled back to the open door.

"It's Bully!" he bellowed so loudly that his words were plainly audible to the partners lying in the shadow. "Bully's a-comin' up the road right now! Let's get him!"

There was a wild, bawling chorus of shouts that outdid anything preceding, and the door seemed to vomit men in all stages of intoxication who came heavily out with their boots stamping across the boards of the porch. They cursed, imprecated, shook their fists, and threatened, as they surged into the road and looked down it toward the approaching driver. The men in the shade got quickly to their feet, interested spectators, and the burros awoke from their drowsy somnolence, and turned inquiring, soft eyes on their owners.

Calmly driving up toward the mob in the road came a mountain buckboard drawn by two sweating horses. In the seat was a man who drove as if the reins were completely in control. He appeared to be stockily built, and his shoulders—broad, heavy, and high—had, even in that posture, the unmistakable stamp of one who is accustomed to stooping his way through drifts and tunnels. He wore a black slouch hat, which had been shaped by habitual handling to shade his eyes. His hair was white; his neck short and thick, with a suggestion of bull-like power and force. His face, as he approached to closer range, showed firm and masterful. His nose was dominant—the nose of a conqueror who overrides all obstacles. He came steadily forward, without in the least changing his attitude, or betraying anxiety, or haste. The men in the road waited, squarely across his path, and their hoarse fulminations had died away to a far more terrifying silence; yet he did not seem to heed them as his horses advanced.

"Gad! Doesn't he know who they are?" the bigger man by the rock mumbled to his partner.

"If he doesn't he has a supreme nerve," the younger man replied. "They look to me as if they mean trouble. They're in a pretty nasty temper—what with all the poison they've poured in, and all the injustice they believe they have met. Wonder who's right?"

A shout from the crowd in the roadway interrupted any further speculation. The man who had first appeared on the road-house porch threw up his hand, and roared, "Here he is! We've got him! It's the Bully!"

The shout was taken up by others until a minature forest of raised fists shook themselve threateningly at the man in the buckboard who was now within a few feet of them.

"Get a rope, somebody! Hang him!" yelled an excited voice.

"Yes, that's the goods," screamed another, heard above the turmoil. "Up with the Bully!"

Two men sprang forward, and caught the horses by their bits, and brought them to an excited, nervous stop, and the others began to surround the wagon. The man in the seat made no movement, but sat there with a hard smile on his firm lips. The partners stepped to the top of a convenient rock, where they could overlook the meeting, and watched, perturbed.

"I don't know about this," the elder said doubtfully. "Looks to me like there's too many against one ,and I ain't sure whether he deserves hangin.' What do you think?"

"Let's wait and see. Then, if they get too ugly, we'll give them a talk and try to find out," the younger man answered.

Even as he spoke, a man came runing from the door of the road house with a coil in his hand, and began to assert drunkenly: "Here it is! I've got it! A rope!"

The partners were preparing to jump forward and protest, when a most astonishing change took place. The man in the wagon suddenly stood up, stretched his hand commandingly to the men holding the horses' heads, and ordered: "Let go of my horses there, you drunken idiots! Let go of them, I say, or I'll come down there and make you! Understand?"

The men at the horses' heads wavered under that harsh, firm command, but did not release their hold. Without any further pause, the man jumped from his buckboard squarely into the road, struck the man holding the rope a sweeping side blow that toppled him over like a sprawling dummy, jerked the coil from his hands, and tore toward his horses' heads. As if each feared to bar his advance, the men of the mob made way for him, taken by surprise. He brought the coil of rope with a stinging, whistling impact into the face of the nearest man, who blinded, threw his hands upward across his eyes and reeled back. The man at the other horse's head suddenly turned and dove out of reach, but the whistling coil again fell, lashing him across his head and shoulders.

Without any appearance of haste, and as if scornful of the mob that had so recently been threatening to hang him, the man walked back to his buckboard, climbed in, and stood there on his feet with the reins in one hand, and the rope in the other. "You get away from in front of me there," he said, in his harsh, incisive voice; "I'm tired of child's play. If you don't let me alone, I'll kill a few of you. Now, clear out!"

The men around him were already backing further away, and at this threat they opened the road in such haste that one or two of them nearly ran over others.

"Say," admiringly commented the big observer on the rock, "we'd play hob helpin' him out. He don't need help, that feller don't. If I ever saw a man that could take care of himself——"

"He certainly is the one!" his companion finished the sentence.

"Who does this rope belong to?" demanded the hard-faced victor in the buckboard, looking around him.

No one appeared eager to claim proprietorship. He gave a loud, contemptuous snort, and threw the rope far over toward the road house.

"Keep it!" he called, in his cold, unemotional voice. "Some of you might want to cheat the sheriff by hanging yourselves. After this, any or all of you had better keep away from me. I might lose my temper."

He sat down in the seat with a deliberate effort to show his scorn, picked the reins up more firmly, glanced around at the rear of his buckboard to see that his parcels were safe, ignored the cowed men, and without ever looking at them started his horses forward. As they began a steady trot and passed the partners, he swept over them one keen, searching look, as if wondering whether they had been of the mob, turned back to observe their loaded burros, apparently decided they had taken no part in the affair, and bestowed on them a faint, dry smile as he settled himself into his seat. At the bend of the road he had not deigned another look on the men who had been ravening to lynch him. He drove away as carelessly as if he alone were the only human being within miles, and the partners gave a gasp of enjoyment.

"Good Lord! What a man!" exclaimed the elder, and his companion answered in an equally admiring tone: "Isn't he, though! Just look at these desperadoes, will you!"

With shuffling feet some of them were turning back toward the inviting door in which the bar-tender stood with his dirty apron knotted into a string before him. Some of the more voluble were accusing the others of not having supported them, and loudly expounding the method of attack that would have been successful. The man with red welts across his face was swearing that if he ever got a chance he would "put a rifle ball through Bully." The young man by the rock grinned and said: "That's just about as close as he would ever dare come to that fellow. Shoot him through the back at a half-mile range!"

The bartender suddenly appeared to remember the travelers, and ran across the road.

"I'm sorry, gents," he said, "that I can't do more to show you the way, but you see how it is. Go up there to that big rock that looks like a bear's head, then agle off south-east, and you'll find a trail. When you come to any crossins, don't take 'em, but keep straight on, and bimeby, about tomorrer, if you don't camp too long tonight, you'll see a peak—high it is—with a yellow mark on it, like a cross. Can't miss it. Right under it's the Croix Mine. You leave the trail to cross a draw, look down and there you are. So long!"

He turned and ran back across the road in response to brawling shouts from the men whose thirst seemed to have been renewed by their encounter with the masterful man they called "Bully," and the partners, glad to escape from such a place, headed their animals upward into the hills.

CHAPTER II

THE CROIX D'OR

It was the day after the halt at the road house. Half-obliterated by the debris of snowslide and melting torrent, the trail was hard to follow. In some places the pack burros scrambled for a footing or skated awkwardly with tiny hoofs desperately set to check their descent, to be steadied and encouraged by the booming voice, deep as a bell, of the man nearest them. Sometimes in dangerous spots where shale slides threatened to prove unstable, his lean, grim face and blue-gray eyes appeared apprehensive, and he braced his great shoulders against one of the bulging packs to assist a sweating, straining animal. After one of these perilous tracts he stopped beside the burros, pushed the stained white Stetson to the back of his head, exposing a white forehead which had been protected from the sun, and ran the sleeve of his blue-flannel shirt across his face from brow to chin to wipe away the moisture.

"Hell's got no worse roads than this!" he exclaimed. "Next time anybody talks me into takin' a cut-off over a spring trail to save a day and a half's time, him and me'll have an argument!"

Ahead, and at the moment inspecting a knot in a diamond hitch, the

other man grinned, then straightened up, and, shading his eyes from the sun with his hat, looked off into the distance. He was younger than his partner, whose hair was grizzled to a badger gray, but no less determined and self-reliant in appearance. He did not look his thirty years, while the other man looked more than his forty-eight.

"Well, Bill," he said slowly, "it seems to me if we can get through at all we've saved a day and a half. By the way, come up here."

The grizzled prospector walked up until he stood abreast, and from the little rise stared ahead.

"Isn't that it?" asked the younger man. "Over there—through the gap; just down below that spike with a snow cap." He stretched out a long, muscular arm, and his companion edged up to it and sighted along its length and over the index finger as if it were the barrel of a rifle, and stared, scowling, at the distant maze of mountain and sky that seemed upended from the green of the forests below.

"Say, I believe you're right, Dick!" he exclaimed. "I believe you are. Let's hustle along to the top of this divide, and then we'll know for sure."

They resumed their progress, to halt at the top, where there was abruptly opened below them a far-flung panorama of white and gray and purple, stretched out in prodigality from sky line to sky line.

"Well, there she is, Dick," asserted the elder man. "That yellow, cross-shaped mark up there on the side of the peak. I kept tellin' you to keep patient and we'd get there after a while."

His partner did not reply to the inconsistency of this argument, but stood looking at the landmark as if dreaming of all it represented.

"That is it, undoubtedly," he said, as if to himself. "The Croix d'Or. I suppose that's why the old Frenhcman who located the mine in the first place gave it that name—the Cross of Gold!"

"Humph! It looks to me, from what I've heard of it," growled the older prospector, "that the Double Cross would have been a heap more fittin' name for it. It's busted everybody that ever had it."

The younger man laughed softly and remonstrated: "Now, what's the use in saying that? It wasn't the Croix d'Or that broke my father——"

"But his half in it was all he had left when he died!"

"That is true, and it is true that he sunk more than a hundred thousand in it; but it was the stock-market that got him. Besides, how about Sloan, my father's old-time partner? He's not broke, by a long shot!"

"No," came the grumbling response, "he's not busted, just because he had sense enough to lay his hand down when he'd gone the limit."

"Lay his hand down? Say, Bill, you're a little twisted, aren't you? Better go back over the last month or two and think it over. We, being partners, are working up in the Coeur d'Alenes. Our prospect pinches out. We've got just seven hundred left between us on the day we bring the drills and hammers back, throw them in the corner of the cabin, and say 'We're on a dead one. What next?' Then we get the letter saying that my father, whom I haven't seen in ten years, nor heard much of, owing to certain things, is dead, and that all he left was his half of the Croix d'Or. The letter comes from whom? Sloan! And it says that although he and my father, owing to father's abominable temper, had not been intimate for a year or two, he still respected his memory, and wanted to befriend his son. Didn't he? Then he said that he had enough belief left in the Croix d'Or to back it for a hundred thousand more, if I, being a practical miner, thought well of it. Do you call that laying down a hand? Humph!"

The elder man finished rolling a cigarette, and then looked at him with twinkling, whimsical eyes, as if continuing the argument merely for the sake of debate.

"Well, if he thinks it's such a good thing, why didn't he offer to buy you out? Why didn't they work her sooner? She's been idle, and water-soaked, for three years, ain't she? As sure as your name's Dick Townsend, and mine's Bill Matthews, that old feller back East don't think you're goin' to say it's all right. He knows all about you! He knows you don't stand for no lies or crooked work, and are a fool for principle, like a bee that goes and sticks his stinger into somethin' even though he knows he's goin' to kill himself by doin' it."

"Bosh!"

"And how do you know he ain't figurin' it this way: 'Now I'll send Dick Townsend down there to look at it. He'll say it's no good. Then I'll buy him out and unload this Cross of Gold hole and plant it on some tenderfoot and get mine back!' You cain't make me believe in any of those Wall Street fellers! They all deal from the bottom of the deck and keep shoemaker's wax on their cuff buttons to steal the lone ace!"

As if giving the lie to his growling complaints and pessimism, he laughed with a bellowing cachinnation that prompted the burros, now rested, to look at him with long gray ears thrust forward curiously, and wonder at his noise.

Townsend appeared to comprehend that his partner was but half in earnest, and smiled good-humoredly.

"Well, Bill," he said, "if the mine's not full of water or bad air, so that we can't form any idea at all, we'll not be long in saying what we think of it. We ought to be there in a hour from now. Let's hike."

They began the slow, plodding gait of the packer again, finding it easier now that they were on the crest of a divide where the trail was less obstructed and firmer, and the yellow lines on the peak, their goal, came more plainly into view. The cross resolved itself into a peculiar slide of oxidized earth traversing two gullies, and the arm of the cross no longer appeared true to the perpendicular. The tall tamaracks began to segregate as the travelers dropped to a lower altitude; and pine and fir, fragrant with spring odor, seemed watching them. The trail at last took an abrupt turn away from the cross-marked mountain, and they came to another halt.

"This must be where they told us to turn off through the woods and down the slope, I think," said Townsend. "Doesn't it seem so to you, Bill?"

The old prospector frowned off toward the top of the peak now high above them, and then, with the peculiar far-sightedness of an outdoor man of the West, looked around at the horizon as if calculating the position of the mine.

"Sure," he agreed. "It can't be any use to keep on the trail now. We'd better go to the right. They said we'd come to a little draw, then from the top of a low divide we'd see the mine buildings. Come on, Jack," he ended, addressing the foremost burro, which patiently turned after him as he led the way through the trees.

They came to the draw, which proved shallow, climbed the opposite bank, and gave an exclamation of surprize.

"Holy Moses! They had some buildings and plant there, eh, Dick?"

The other, as if remembering all that was represented in the scene below, did not answer. He was thinking of the days when his father and he had been friendly, and of how that restless, grasping, conquering dreamer had built many hopes, even as he squandered many dollars, on the Croix d'Or. It was to produce millions. It was to be one of the greatest gold mines in the world. All that it required was more development. Now, it was to have a huge mill to handle vast quantities of low-grade ore; then all it needed was cheaper power, so it must have electric equipment. Again the milling results were not good, and what it demanded was the cyanide process.

And so it had been, for years that he could still remember, and always it led his father on and on, deferring or promising hope, to come, at last, to this! A great, idle plant with some of its buildings falling into decay, its roadways obliterated by the brush growth that was creeping back through the clearings as Nature reconquered her own, and its huge waste dumps losing their ugliness under the green moss.

It seemed useless to think of anything more than an occasional pay chute. Yet, as he thought of it, hope revived; for there had been pay chutes of marvelous wealth. Why, men still talked of the Bonanza Chute that yielded eighty thousand dollars in four days' blasting before it worked out! Maybe there were others, but that was what his father and Sloan had always expected, and never found!

His meditations were cut short by a shout from below. A man appeared, small in the distance, on the flat, or "yard" of what seemed to be the blacksmith shop.

"Wonder who that can be?" speculated Bill, drawing his hat rim farther over his eyes.

"I don't know," answered Townsend, puzzled. "I never heard of their having any watchmen here. But we'll soon find out."

They started down the hillside at a faster pace, the tired animals surmising, with their curiously acute instinct, that this must be the end of the journey and hastening to have it over with. As they broke through a screen of brush and came out to the edge of what had been a clearing back of a huge log bunk-house, the man who had shouted came rapidly forward to meet them. There was a certain shiftless, sullen, yet authoritative air about him as he spoke.

"What do you fellers want here?" he asked. "I s'pose you know that no one's allowed on the Cross ground, don't you?"

"We didn't know that," replied Townsend, inclined to be pacific, "but I fancy, we are different from almost any one else that would come. We represent the owners."

"Can't help that," came the blustering answer. "You'll have to hit the trail. I don't take orders from no one but Presby."

A shade of annoyance was depicted on Townsend's face as he continued to ignore the watchman's arrogance, and asked: "And please tell us, who is Presby?"

"Presby? Who's Presby? What are you handin' me? You don't know Presby?"

"I don't, or I shouldn't have asked you," Townsend answered with less patience.

"Say," drawled his companion, with a calm deliberation that would have been dreaded by those who knew him, "does it hurt you much to be civil? You were asked who this man Presby is. Do you get that?"

The watchman glared at him for a moment, but there was something in the cold eyes and firm lines of the prospector's face that caused him to hesitate before venturing any further display of officiousness.

"He's the owner of the Rattler," he answered sullenly, "and I've got orders from him that nobody, not any one, is to step a foot on this ground. If you'd 'a' come by the road, you'd 'a' seen the sign."

The partners looked at each other for an instant, and the younger man, ignoring the elder's apparent wrath, said: 'Well, I suppose the best thing we can do is to leave the burros here and go and see Presby, and get this man of his called off."

"You'll leave no burros here!" asserted the watchman, recovering his combativeness.

"Why, you fool," exploded Mathews, starting toward him with his fists clenched and anger blazing from his eyes at the watchman's obstinate stupidity, "you're talking to one of the owners of this mine! This is Mr. Townsend."

For an instant the man appeared abashed, and then grumbled acridly: "Well, I can't help it. I've got orders and ——"

"Oh, come on, Bill," interrupted the owner, stepping to the nearest burro's head. "We'll go on over to Presby, and get rid of this man of his. It won't hurt the burros to go a little farther."

He turned to the watchman, who was scowling and obdurate.

"Where can Presby and the Rattler be found?" he asked crisply.

"Around the turn down at the mouth of the canon," the watchman mumbled. "It's not more than half or three-quarters of a mile from here, but you'd better go back up the hill."

As if this last suggestion was the breaking straw, the big prospector jumped forward, and caught the man's wrist with dexterous, sinewy fingers. He gave the arm a jerk that almost took the man from his feet. His eyes were hard and sharp now, and his jaw seemed to have shut tightly.

"We'll go back up no hill, you bet on that!" he asserted belligerently. "We go by the road. We're done foolin' with you, my bucko! You go ahead and show the way and be quick about it! If you don't, you'll have trouble with me. Now git!"

He released the wrist with a shove that sent the watchman ten feet away, and cowed him to subjection. He recovered his balance, and hesitated for a minute, muttering something about "being even for that," and then, as the big, infuriated miner took a step toward him, said: "All right! Come on," and started toward a roadway that, half ruined, led off and was lost at a turn. Cursing softly and telling the burros that it was a shame they had to go farther on account of a fool, the prospector followed, and the little procession resumed its straggling march.

They passed the huge bunk-house, a mess-house, an assay office , what seemed to be the superintendent's quarters, and a dozen smaller structures, all of logs, and began an abrupt descent. The top of the canon was so high that they looked down on the roof of the big, silent stamp mill with its quarter of a mile of covered tramway stretching like a huge, weather-beaten snake to the dumps of the grizzly and breakers behind it.

The road was blasted from the side of the canon on which they were, and far below, between them and the hoisting house and the mill, ran a clear little mountain stream, undefiled for years by the silt of industry. The peak of the cross, lifting a needle point high above them, as if keeping watch over the Blue Mountains, the far-distant Idaho hills, the near-by forests of Oregon, and the puny, man-made structures at its feet, appeared to have a lofty disdain of them and the burrowings into its mammoth sides, as if all ravagers were mere parasites, mad to uncover its secrets of gold, and futile, if successful, to wreak the slightest damage on its aged heart.

(Continued in the next issue)

Interested in Tractors?

There can be little question but what the farm tractor will come into a big use on hundreds of farms from this time on. A good tractor which costs no more than five or six good work horses or mules and does the work of that many animals is a mighty good proposition because while horses and mules must be fed every day in the year, all the tractor requires is some gasoline while it is at work—and when it stops working the expense stops with it. It doesn't mind either heat or cold and pays no attention to flies. It plows your soil any depth while the engine power can be utilized in filling the silo, sawing wood, pumping water, fixing roads or hauling heavy cargoes to town.

Elsewhere in this issue will be found the advertisement of the Avery Co. of Peoria, Ill., and we would suggest to all of our readers who are interested to drop a line to this well known concern at once and ask them for complete information. They will send you a lot of literature that will give you some very interesting facts on the use of tractors on the farm—a machine which promises to revolutionize farming methods during the next ten years. When you write be sure to mention The Missouri Farmer.

Do You Drive an Auto?

If you own an automobile you are of course interested in saving every dollar possible on tires and it will pay you to drop a line to the Firestone Tire and Rubber Co. of Akron, Ohio—wohse advertisement appears elsewhere in this issue—and have them send you a lot of information which is free for the asking and which will save you a lot of money in future tire bills. Be sure to mention The Missouri Farmer when you write.

START OUT AT $900 PER YEAR

Parcel Post makes demand greater than ever. 70 per cent insures you employment for life, rapid promotion. We offer other Civil Service Courses. Attend on credit and pay us as government pays you. Four big buildings. College band. Athletic park. Beautiful campus. Railroad fare paid. Write for catalog.

The Missouri Farmer:

Enclosed find check to pay for advertising. Business is rather quiet just now, but The Missouri Farmer has done me more good this season than any other paper. I am with you indefinitely. My Durocs are doing splendid, and lots of summer pigs arriving.

J. E. WELLER.

Linhardt's Good Polands

Elsewhere in this paper will be noticed the new advertisement of H. O. Linhardt, Lohman, Mo., in which Poland China spring boars and gilts are offered for sale.

Here is a herd that readers of this paper should investigate before they make any contemplated purchases this fall, because it is one of the really good herds of central Missouri. Mr. Linhardt began breding big type Poland Chinas a number of years ago, in a rather modest way and gradually built up a herd that is first class in every way.

From the very beginning, extreme care and judgment has been used in selecting the boars and sows intended for service in the herd. Size and bone were kept in mind, but not to the exclusion of other desirable attributes, and no animal found a place in the herd that did not possess that degree of quality demanded by the best buyers.

At the head of the herd stands the two good boars, Governor Hadley 61884, and Giant Mammoth 68395. Governor Hadley was sired by Big Hadley 2nd, by the noted Big Hadley, and has for a dam the good sow, Black Saltana, sired by Big Bill Taft, the boar that did so much toward putting Dr. Gildow & Son's Plainview herd in the front. Giant Mammoth is one of the good young boars owned in this state. He is a boar with plenty of scale and bone, excellent lines and exceptional quality. He was sired by Expansion Chief by Panorama, and is out of Latest Style by Band Master. These two boars are the sires of the hundred or more good spring boars and gilts that are now offered for sale. The writer recently visited this herd and does not hesitate to recommend it to our readers. Prospective buyers will find Mr. Linhardt a very pleasant man to do business with and will find that his prices are extremely reasonable. Everything he offers is sold on a guarantee of satisfaction.

Besides the spring stuff mentioned there are a number of good stretchy, heavy boned, fall boars that are just right for heavy service.

In writing please bear in mind that Mr. Linhardt would appreciate being told where you saw his ad.

Snyder's Red Polls

Our readers are referred to the new advertisement of M. L. Snyder, Polo, Mo., in which a number of strong young Red Poll bulls are offered for sale. This is one of the newer herds owned in this state, but the herd was established in Iowa some sixteen years ago, and was brought to Missouri only about one year ago. The herd was established in 1899 by the purchase of the good cow Riverview Beauty 15748 and the fact that this cow is still in the herd and producing is evidence that she was a remarkably good cow.

The herd has always been handled with the idea of developing the dual purpose qualities of milk and beef. Mr. Snyder has been very careful in selecting his herd bulls and such bulls as Model 2nd 7378, Prince Lee 5788, Bumps 9036 and the noted show bull Logan 13500 by Abbotsford 4721 have played a prominent part in the development of the herd. The writer has visited this herd and has seen the young bulls that are offered for sale, several of which are sired by Logan, and believes that any of our readers who are in the market for Red Polls, will have no difficulty in finding what they want. The prices asked for these young bulls is extremely reasonable and Mr. Snyder would be very glad to have any one interested visit his herd and look over his offering.

Choice Duroc Spring Boars and Gilts

A. White, Jr. Palmyra, Mo., is offering the best lot of Duroc spring boars and gilts he has ever raised. Most of the offering is sired by Mr. White's junior champion boar, Crimson Col. I Am, one of the best bred Duroc boars owned in Missouri, and a boar that is siring the right kind. The dams of the spring stuff represent most of the very choicest Duroc blood lines, and many of them have high records as producers of show ring winners. In addition to the spring lot, Mr. White has a number of fall gilts and mature sows that he has bred for fall farrow that he is pricing worth the money. A number of these sows are bred to Select Col. II, the boar that Mr. White secured at C. C. Boyd's dispersion sale last February. Select Col. II is easily one of the top boars of the breed. He has everything discriminating breeders look for in a high class boar. We feel sure our readers will be pleased with the kind of Durocs Mr. White is producing. Mention this paper when you write.

Oakwood Poland Chinas

H. S. Williamson, Centralia, Mo., one of the pioneer breeders of Missouri, is offering a nice lot of big fall boars and gilts sired by his two well known herd boars, Success and Controller. This stuff has been handled well and at the prices asked are real bargains.

The Oakwood herd is one of the largest in this state and can at all times furnish anything from pigs to bred sows. Every one offered for sale has been given the double treatment and is sold on a guarantee of satisfaction or your money back.

Four Good Angus Bulls

J. M. Jones, Everton, Mo., has four extra good young Angus bulls large enough for service, that he is pricing down the line for a quick sale. Three of these bulls are extra good ones.

Lockridge's Giant Poland Chinas

Will G. Lockridge is offering a highly desirable lot of spring boars and gilts sired by his great young boar, The Giant —in name and in fact one of the largest boars of his age the writer knows of. Mr. Lockridge is to be congratulated upon developing such a boar as he owns in The Giant, and from now on Poland China breeders may expect great things from this herd. Now is the time to secure the blood of The Giant.

In addition to the spring stuff now offered Mr. Lockridge has selected a number of excellent A Wonder fall gilts that he has bred to The Giant for fall litters. These gilts are right in every respect and are the kind that will make the purchaser money. Write Mr. Lockridge for prices.

Chester White Boars and Gilts

For over thirty years H. Rauscher & Son, Kahoka, Mo., have maintained a high class herd of Chester Whites. A statement of this kind should receive more than passing interest from our readers who are planning to buy this fall. In the first place, Messrs. Rauscher's hogs must be the profitable kind, else they would not continue to breed them. In the second place the kind they are producing must meet with the approval of buyers, else old customers would not come back and buy new blood year after year.

The herd was never in better shape than at present and most anything from fall boars and fall gilts bred for September and October farrow, to spring pigs of either sex can be furnished in pairs or more, not related. If in the market for something good at a reasonable price just drop them a card or visit the herd. Mention The Missouri Farmer.

Last Call for Faulkner's Spotted Poland China Sale

Bear in mind that August 11th is the date of H. L. Faulkner's annual Spotted Poland China sale.

Mr. Faulkner is almost too well known to our readers to require any extended notice at our hands, but for the benefit of those who are not familiar with this herd, we will say that Mr. Faulkner is recognized as the pioneer Spotted Poland breeder of this state and that nearly

Choice spring boars and gilts. Fall boars and gilts. All sired by GIANT MAMMOTH, GOVERNOR HADLEY and MAMMOTH WONDER. Satisfaction is guaranteed. Have shipped to 23 states.

H. O. LINHARDT, LOHMAN, MO.

every herd of any importance has more or less of Mr. Faulkner's breeding. The coming sale will afford an excellent opportunity for the purchase of sows bred for fall farrow, spring gilts and boars of serviceable age.

Mr. Faulkner writes that the sale offering is coming along in great shape. The bred sows are showing down heavy and the spring pigs are an exceptionally strong lot. Mr. Faulkner has made a marked success of handling the popular spotted hog. The kind he sells are the kind that make money for him, and are the kind that will make money for the purchaser. The sale will be held in Jamesport, and those who attend are assured of a royal time. Write at once for the catalog and plan to go to this good sale. Mention The Missouri Farmer.

Brockman's Big Durocs

Readers of The Missouri Farmer who are in the market for Durocs with size and quality should write A. C. Brockman, Centralia, Mo., whose advertisement will be found in this paper. Mr. Brockman has an exceptionally good herd and writes that he never had a better lot of spring boars and gilts than his present offering, and that he is in a position to furnish buyers with pairs or more of unrelated stock.

Holstein Bulls

S. W. Cooke & Sons, Maysville, Mo., are offering eight Holstein bull calves that range in age from two to eight months old. These calves are all nicely marked, have plenty of size, and are out of some of the heaviest producing cows in the Cooke herd.

Messrs. Cooke have one of the very high class herds owned in the Middle West and are breeding for high testing, long distance, heavy producers. This herd has been tested for tuberculosis for years, and has never had a reactor. If you want the good kind they have them.

Adenhill Durocs

R. L. Hill, Columbia, Mo., can supply choice Duroc spring boars and gilts at very reasonable prices.

Mr. Hill's herd is one of the best known in Missouri and many of our readers have found it to their interest to purchase breeding stock from the Adenhill herd.

Mr. Hill, who is a graduate of the College of Agriculture, is a thorough and practical hog man. He understands the essentials of the business and puts into practice the most modern methods of breeding and developing. The spring pigs that are now ready to ship are sired by Col. Wonder II, a prize winner himself, and a son of the champion Col. Wonder, and by Crimson Commander, a very promising young boar. Write Mr. Hill for prices.

Duroc Boar and Gilt Bargains

W. H. and Geo. E. Thomson, Columbia, Mo., who advertise Durocs in this paper, would be glad to hear from any of our readers who are in the market for a choice spring boar or gilt. Messrs. Thomson have built up a herd that ranks among the better herds of this state and readers who make selections from this herd may be sure of getting a square deal and good values.

Messrs. Thomson own a half interest in Col. Wonder II, a prize winning son of Col. Wonder, and counted by many to be the best son of this famous sire. The majority of the spring pigs offered are sired by this boar; other litters are by Beauty's Col, I Am Col. Enough, and Col. Wonder. The dams of the offering carry the blood of such noted sires as Col. Gano, Col. Wonder, Crimson Wonder Again, Col. Chief, Beauty's Model Top, and B. & C.'s Col II.

Thus a nice variet yof breeding is offered and young herds consisting of a boar and one or more unrelated gilts can be furnished. Messrs. Thomson have grown these pigs carefully, feding a balanced ration and plenty of good pasture. We urge our readers to write this firm for their prices.

Angus Heifers

J. D. Blackwell, Fayette, Mo., is offering 22 well bred Angus females. They are two-year-old heifers and cows with 10 suckling calves at foot. The prices asked should prove very attractive to any one interested.

Mr. Blackwell is among the oldest breeders of Angus cattle in Missouri and enjoys the confidence of all who know him.

Holsteins for Sale

M. E. Moore & Co., Cameron, Mo., are offering their whole herd or any part of it for sale. This exceptional opportunity is made possible in order to close the partnership now existing between Mrs. M. E. Moore and William Zimmerman.

The Moore herd is the oldest Holstein herd in Missouri, and for years has been bred and developed along conservative yet progressive lines. Overy eighty per cent of the breed has been given A. R. O. records.

Write for prices, mentioning this paper.

Jersey Bargains

J. B. Smith, Platte City, Mo., is advertising a choice lot of young Jersey cows and heifers for sale. Mr. Smith is one of the best known Jersey breders in the West. For years he maintained his herd at Beatrice, Nebraska, and only a little over a year ago was the herd brought to this state.

Mr. Smith believes in breeding for production as well as beauty and the young stock referred to in his advertisement combine these two points to a marked degree. At the head of the herd is, Stockwell's Champion, a grand champion bull and a sire of prize winners.

Readers of this paper will look a long time before they find better values than are offered by Mr. Smith.

V. E. Lawrence still has a number of good strong young Angus bulls for sale. These bulls are well bred, well grown and are old enough for service. Write Mr. Lawrence for prices. Mention this paper.

Porterfield Has Strong Lot of Durocs

J. A. Porterfield, the popular Duroc breeder at Jamesport, Mo., writes that he has the best lot of spring boars and gilts coming on that he has ever raised.

Mr. Porterfield is one of the leading Duroc breeders of the state and many of our readers have attended his annual February sales. At the head of the herd, and the sire of most of the spring stuff, is the great boar, Top Inventor. Top Inventor, it will be recalled, was shown last year at the State Fair, and was conceded to be the largest Duroc boar on the grounds. Assisting this boar, and represented in the spring crop, are the two younger boars, Auctioneer II by Auctioneer, out of the consistent prize winning dam, Miss Dare; and the other a prize winning son of the champion, Beauty's Model Top. This last boar was purchased after he won second place in a class of twenty-six good ones.

Mr. Porterfield will be at the State Fair this fall and extends a cordial invitation to all our readers to visit his pens.

In the meantime Mr. Porterfield would be glad to hear from any of our readers who are planning to buy Durocs this fall. When you write, kindly mention this paper.

Superior Polands

L. L. Freeman, Kearney, Mo., now controls the herd of big type Poland Chinas formerly owned by Freeman & Russ, and will be ready this fall with an exceptionally useful lot of spring boars and gilts that he plans to sell October 15. This herd takes its name from the former herd boar, Big Superior, a boar that was used with notable effect a year or two ago. At present the herd is headed by King Jumbo, by J. B. D., a son of Miller's Jumbo. The dam of King Jumbo was Big Lill, a Long John sow. This young boar is an exceptionally good kind, he has plenty of size and bone, a wide, high arched back, deep, smooth sides, and extra good hams. He has been used extensively the past year and the majority of the spring pigs are by him. Mr. Freeman writes that he never had pigs do better, and predicts that by sale time he will have one of the best lots to be sold this year. Watch this paper for further announcements.

Dickerson Will Sell Spotted Polands October 6

Homer T. Dickerson, Jameson, Mo., will hold his second annual sale of Spotted Poland Chinas Wednesday, October 6.

Mr. Dickerson is one of the younger breeders of this state, but his herd is entitled to be considered among the best. The foundation stock was carefully selected from the most popular spotted blood lines. This sale will be one of the good ones to keep in mind. We will have more to say regarding the sale offering in subsequent issues.

Hall & Rapp, Rocheport, Mo., can supply any of our readers with mighty good values in Poland Chinas—either black or spotted. Get their prices.

STATE FAIR JUDGES

The following judges have been named for this year's Missouri State Fair Live Stock Shows:

Draft and coach horses—J. G. Fuller, Madison, Wis.

Light harness horses—Victor Robison, Harrodsburg, Ky.; Walter Palmer, Ottawa, Ill., and Ben Glenn, Columbia, Mo.

Aberdeen Angus and Galloway cattle—Dr. H. M. Brown, Hillsboro, O.

Dairy cattle—C. T. Graves, Liberty, Mo.

Hampshire and Berkshire hogs—W. E. Spicer, Bushnell, Ill.

Duroc-Jerseys—W. A. Williams, Marlow, Okla.

Duroc-Jersey Futurity—Prof. L. A. Weaver, Columbia, Mo.

Poland Chinas—To be named.

Chester White—J. H. Harvey, Maryville, Mo.

Fine wool sheep—E. B. Wilson, Stanberry, Mo.

Medium wool sheep—Frank Kleinheinz, Madison, Wis.

Poultry—Thomas W. Southard, Kansas City, Mo.

Vermont Guernsey Makes Notable Record

The Guernsey cow, Novice Masher 33365, A. R. 2609, bred and owned by E. R. Andrews of Putney, Vermont, has recently completed a very noteworthy record. As a two and a half year old she was put on test in 1912, and made in the following year 7813.60 pounds of milk and 392.39 pounds of butter fat. She was tested again when she freshened in May, 1914, and during the following year she produced 13,649.00 pounds of milk and 706.97 pounds of butter fat, as a three and a half year old, carrying a calf seven months. Her highest production was made in the month of December when she produced 67.19 pounds butter fat, and her lowest month's production was 54.15 pounds of butter fat, thus showing the persistency with which she completed her record

CHESTER WHITES

RAUSCHER'S CHESTER WHITES!
One of the Oldest Herds in the West
A few choice spring gilts bred for early farrow. Several richly bred big spring boars. A fine lot of fall pigs. Size, quality, and bone. Prices reasonable and every pig guaranteed.
H. Rauscher & Son, Kahoka, Mo.

Maple Grove O. I. C's
Over 100 spring pigs from 2 to 3 months old at the following prices: Choice of litter, $12; litter average, $10; fall gilts, $15. Bred gilts $20 to $25. Bred sows, $30 to $35. Prize winning blood and the most popular strains. Each individual guaranteed to give satisfaction.
F. J. GREINER, BILLINGS, MO.

100 Prize-Winning O.I.C's
Our herd is headed by grand champion and champion boars of 1914 shows. Sows of equal merit. All backed by long line of prize winners. Early pigs, singles, pairs or more not akin, at rock bottom prices. We can please you. Write or come.
S. D. & B. H. FROST,
Box H Kingston, Mo.

JERSEY CATTLE

JERSEY CATTLE
Bulls ready for service. They are sired by the Owls Champion 85990. His grand dam on dam's side, Rubano's Fancy, has a record of 21 lb. 10 oz. in 7 days. We have these young bulls for sale at a price that ought to move them. Also a few heifers.
Wm. H. Bruns & Son, Concordia, Mo.

Jersey Cows
I want to sell 20 head of registered cows and heifers that are either fresh or soon will be. Also four young bulls.
J. B. SMITH Platte City, Mo.

HOLSTEIN CATTLE

IN MISSOURI
Eight bulls, 2 to 8 months, $100 to $175 each. Always have a few good cows and bred heifers for sale. Nothing but registered Holsteins.
S. W. COOKE & SON, MAYSVILLE, MO

HOLSTEINS
Young bulls and heifers from A. R. O. cows. Sired by Sir Korndyke Imperial 53683. Eighty per cent of herd have A. R. O. records. Inspection invited.
M. E. Moore & Co., Cameron, Mo.

ANGUS CATTLE

Choice Aberdeen-Angus
Established 30 years. 100 head in herd. We are offering good useful Bulls, and Heifers of excellent individual merit and breeding. Prices reasonable. Our customers make them popular.
D. L. Sutherland & Sons Windsor, Mo

Aberdeen-Angus
I am offering a number of young bulls, cows and heifers—good individuals and well bred. Also some extra good Poland China Hogs at moderate prices.
J. D. Blackwell Fayette, Mo.

ANGUS CATTLE
HERD FOUNDED 1904
Seven early calves—3 BULLS and 4 HEIFERS, sired by Dean's Eric 139686. Every one the right kind, and priced to sell.
V. E. LAWRENCE, SALISBURY, MO.

Angus Bargains
Registered bulls and heifers. The market topping kind. Leading families represented. Priced worth the money and satisfaction guaranteed.
Also Poland China hogs.
J. M. JONES, R. F. D. 3, EVERTON, MO.

OTHER BREEDS

Shorthorn Bulls and Heifers
PEABODY FARM now offers 12 choice young bulls and 20 heifers. Good individuals; reds and roans. Priced to sell. Also 20 open BERKSHIRE gilts. Get our prices.
June K. King & Son Marshall, Mo.

GALLOWAY CATTLE
Young stock for sale at all times. Herd established 25 years.
J. & W. R. CLELLAND,
New Hampton, Mo.

RED POLLED CATTLE
HERD ESTABLISHED 16 YEARS
Young stock for sale at all times. Young bulls for sale sired by Logan 13500. The duel purpose kind.
A. P. Snyder - Polo, Mo.

Dooley's Spotted Polands
Big bone, spotted pigs now ready to ship —$25 single pig, $45 pair, $65 trio. Pairs and trios no relation. Also registry furnished. Send check with first letter.
EDGAR DOOLEY, ETTERVILLE, MO.

A Beautiful Piano FREE

A splendid opportunity for some bright Farmer Girl in every community in Missouri to earn a handsome piano entirely through her own efforts during the next three months!

WHERE is there a normal minded girl—whether she lives in town or on the farm—who would not like to own a beautiful Piano? In these days, the ability to play upon this great instrument is a part of the average girl's education. Not only is it a beautiful ornament which graces the modern farm home—not only is it a source of great pride and pleasure to the entire family—but in the after years the social status of every young woman is more or less affected by her ability to perform, in a modest degree at least, upon this greatest and sweetest of all musical instruments. With a piano comes grace, refinement and culture—those finer sensibilities—that "polish," which means so much to every bright young woman in the after years—which make her more interesting to herself and more charming to her friends and loved ones.

Realizing that there are many bright farmer girls in whose homes THE MISSOURI FARMER is a visitor whose parents are unable to buy them a Piano at this time, we have concluded to offer the splendid instrument illustrated in the accompanying picture to **one** young lady **in every community** in the state—and when you learn the conditions under which this Piano will be awarded you will be surprised to find that it is **within easy reach** of every bright girl who will do a little real hustling to the end that every good farmer in her neighborhood becomes a reader of THE MISSOURI FARMER.

We do not ask you to engage in any "contest". We will simply award the Piano for a certain number of subscriptions and that is all there is to it—and the **first** girl who writes us from any postoffice in the state—if her letter reads as if she really **means business**—will get the **first** chance in that particular territory and no other girl will be permitted to compete with her. Should you finally fail to get the full number of subscriptions necessary to entitle you to the Piano, you will nevertheless receive a substantial commission on every subscription you send in, either new or old—**so in any case your efforts will not have been wasted!** There is, however, no reason why any bright girl who is willing to go into the fight with determination shouldn't **win** this beautiful prize—and in the meantime, when you help extend the influence of a clean and up-to-date farm paper like THE MISSOURI FARMER you will be doing fine missionary work for better farming methods.

Don't confuse the Piano we are offering with the many cheap, second rate instruments on the market. THE MISSOURI FARMER has a good name to sustain and however anxious we are for new subscriptions we couldn't afford to offer any prize which wouldn't be a credit to us in the future. This Piano is supplied to us by the John N. Taylor Music House—the most responsible concern of the kind in central Missouri and one which maintains a number of big branch houses in this section of the state. This Piano sells regularly for $350 and the personal guarantee of Mr. Taylor as well as our own goes with every instrument. It is a Piano of the purest tone and quality and embraces the highest workmanship throughout and can be had in a mahogany or any other popular finish desired. **It is a Piano of which you will be proud for many years to come and when you learn how easily you can win it you will be surprised. But there is no time to lose. If you want to get the FIRST CHANCE in your neighborhood you should write us TODAY! Tell us how old you are, whether your parents have given their consent to your making the fight and how far you live from your nearest postoffice!**

Free Trip to Panama Exposition

How would you like to earn a **free** round trip Railroad and Pullman car ticket to the great Panama Exposition? How would you like to travel across the Western prairies, through the snow capped peaks of the Rocky Mountains into the "Wonderland" of California in a "special" Pullman car filled with other young women like yourself? Wouldn't it be bushels of fun—**a trip to be remembered and treasured as long as you live?**

To those who would prefer this great trip to a Piano we offer this splendid opportunity—and again you will be surprised how easy the conditions are. So far as the Exposition itself is concerned, space forbids any attempt to describe it in this advertisement. A good sized book could be written about it, for upon all hands it is admitted to be the greatest and most beautiful exposition ever held anywhere. Neither have we the space to describe this wonderful trip across the Western plains and through the canons and towering crags of the Rockies into Sunny California—a trip where romance and rugged beauty abound upon every hand—a trip which reveals the true majesty of our wonderful Country and which should inspire every normal man and woman in the land. Already it is apparent that the attendance at this great Exposition will eclipse all similar celebrations which have gone before it. In short, judging from the thousands of inquiries which are pouring into the passenger offices of the different western railroads it looks as though mighty near "everybody and his aunt" are going to "hit the trail" for the Golden Gate this fall. We have some beautiful literature which tells you in detail all about the great Exposition and this wonderful trip through the "Empire of the Mighty West" which we shall be glad to send you upon request. If you want to win this great free trip, the sooner you roll up your sleeves and get into the fight the better. If we can make a lot of fine country girls happy and at the same time extend the influence of the paper we feel we are doing a commendable work—so you had better have us reserve your territory for you **today!**

The Circus

As I sit at my desk the strident notes of a steam calliope come flooding in through the open window. The circus has come to town and as I listen to the harsh voice of the "steam pianner" I forget the present and in reverie I am once more a boy back on the farm up in Audrain county and once again I experience those thrills and joys of childhood which are wholly without alloy and which see no threatening cloud upon the horizon of the future. Heroes and statesmen may come and go but in those happy days way back yonder twenty-five and thirty years ago, the magic of old "Pete" Barnum's name meant more to the average country boy than all the pomp and glory that ever attended the greatest conqueror the World has ever known.

For many long, yet happy days I looked forward to the coming of the Circus and as I followed the seemingly endless corn rows and looked off into the shimmering waves of dancing heat I pictured to my mind over and over again the joys that would be mine when the "great day" finally arrived—and once more I live it all over again. Once more I tumble out of bed long before sun up to feed and curry the horses and do the chores in order that we may all get an early start—for one fine thing about a circus is that the "whole family" gets a chance to go; once more I stuff a goodly quantity of hay and a generous feed of oats into the back end of the old wagon-box and put the quilts on the old board seats upon which we "kids" are to sit while Father and Mother and the Baby ride on the spring seat up in front —and when the hurried breakfast is over and the lunch basket has been crammed full of fried chicken, light bread thickly buttered, apple pie and a lot of other stuff good to eat, we are off for the 15-mile drive just as the roosters start their usual morning serenade and the sun—God's immutable and unending smile—begins to peep from behind the crimson horizon in the East.

Once arrived at the county seat and the horses hitched to the back end of the wagon in some sequestered spot, we kids, cautioned to hold onto each others hands, took our places at some point of vantage along the street to await the coming of the parade—and after so long a time the shriek of the steam calliope told us that the great caravan had finally started on its march of triumph. I guess maybe when old Von Hindenburg and Joffre and French and the Russian Grand Duke "come marching home again" they'll scatter flowers in their paths but as for me, in those glorious days of my boyhood I would rather have been the man who proudly and serenely rode at the head of that procession of Elephants, Clowns, Camels, Tigers and Lions than to have had the combined glory and plaudits of all the gladiators and plumed knights in Christendom!

Once more I hear the weird oriental music rendered by the group of "genuine A-rabs." Once more I see the fantastic clown riding backwards on his bucking mule, throwing kisses at shy country maidens. Once more I see the lady with the big, sinuous snake coiled about her and the lion tamer sitting in solitary grandeur amid his servile companions of the jungle. Once more I stare in open-mouthed admiration at the pretty show ladies glistening as if bedecked with a million diamonds and hear the man with the fog-horn voice dwell upon the splendors of the show. Again I see the big, fine prancing horses and once more I am brought back to Earth by my Mother's anxious query about "Sister"—Sister, whose very existence I had forgotten in my excitement of watching the passing panorama.

Years have passed since then and they have had their mixture of lights and shadows. I have sat in great National political conventions and witnessed the man of the hour sway the assembled thousands as the storm sways the sea. So, too, I have seen a great audience of fashionably dressed men and bejeweled women go into raptures over the performance of the haughty stars of grand opera—but all these things are stupid and commonplace compared to the joys of a country boy when the Circus comes to town.

HIS HAT IN THE RING

I notice in your August 1st issue you have "thrown your hat in the ring" and are in the fight against large corporations controlling the products of agriculture. In my humble way I will certainly be with you in this fight, and if it should occur that at any future time there should be any assistance, be it great or small, that it is possible for me to render in this cause I shall certainly take great pleasure in doing so.

The farmer stands in a unique position. No other man on earth occupies a position in reference to marketing his products and buying his raw material and other necessities as does the farmer. No other man is so truly the producer for all mankind. No other man works as hard, lives as frugally, or gives so much of his time, substance and very life itself as the farmer. Talk about the brave boys that take up arms in defense of their country! Are they brave! Do they deserve praise or credit? Yes, they do. But how about the brave farmer who does more for the benefit and welfare of the world every year during all the years of peace than can possibly the soldier in any year during the few years of war? The farmer feeds the world. The soldier at best destroys a little. But you say, the farmer is working for himself; he makes money out of his work; he gets well paid for feeding the world. In the first place I can assure you that the average farmer does not "lay by" more in a year, above his living and necessary expenses, than would the soldier if he would save all he could (as the farmer does) out of his wages. And how about the vast hordes of people the farmer feeds? If many a farmer spent as much money in one year as does many a city man in one month he would be bankrupt before Christmas. The majority of the people whom the farmer works so hard to feed spend more money on high living, personal and selfish pleasures, dress and luxuries in 30 days than does the farmer (who produces their very living) in one year.

How the Farmer Makes His Money

It is true that many farmers have become quite well-to-do, but this has often been due to advanced valuation of his land holdings rather than to the sale of his products. It is, however, also true that some farmers have become independent from the sale of their products, but the most of these, I think you will find, have been breeders of pure bred stock of exceptional merit, and good business men, and have made their wealth by selling better breeding stock to the general farmers and not by selling their products to consumers. On the other hand, it is also true that some farmers have made money in feeding cattle and hogs, some in grain farming and selling on the market, but this has generally been due to favorable locations and unusual ability.

Every man ought to have coming to him enough money, after making proper, earnest, conscientious effort and with hard work, to keep him in his old age where hard work or want should not have to stare him in the face. Most every man has this much come to him except the farmer—the hardest working and most deserving of all. But, you say there is more poverty in the cities than in the country. That is due to the waste, extravagance and high living in the city. As before said, if the farmer lived the same way he would go broke before the next Christmas.

Now, why is this? The farmer is a manufacturer. He takes his raw material, his seed, his soil, his plows and cultivators, his horses, and he goes to work at daylight and works to a wee bit after dark. He works under greater disadvantages than does his brother, city manufacturer, for the latter has his plant covered from the elements, and is dependent only on his labor and the labor of his employes who are under his direction, but the farmer is not only dependent upon his hard efforts and those of his "hired men" but his plant is and has to be right out in the open, where not enough rain is destructive; too much is destructive, one wind destroys a month's work; a hail at the right time destroys half the season's products, and so it goes. The farmer is a manufacturer, turning his raw material into a product with which to feed the whole world, and doing so under the hardest conditions and with the hardest work. Surely this entitles him, in every just sense of the word, to get fair and honest compensation for his product after he has successfully manufactured it.

The city manufacturer and his employes work from seven or eight o'clock until five or six. They work up their raw material, working easy hours, and then they have it ready to offer to the trade. We will suppose this is a manufacturer of plain common clothing, which is probably next to food as a human necessity.

Now, what happens when these products are put onto the market. The city clothing manufacturer figures up his cost of production to a half penny, and he figures a reasonable profit in addition. Then he fixes his price and sends forth his salesmen to get the business. If they can't get the price or sell the goods he sends out another man who can. Of course he has to meet reasonable competition but that is all and he ought to be as able to do that as the other men, else he is not the right man for his line of work. If he makes better clothes he gets more money for them—anyhow, he figures his profits and sets his price.

Who Fixes the Price?

The farmer has his finished products ready to offer to the waiting millions of hungry mouths and what does he do. He does not figure the cost of production. No, it would be no use. He does not say, my price on this is so much. No, it would be of no use. He does not send out salesmen to sell his goods. No, it would be no use. He humbly goes to his nearby town and asks the dealer, who is probably an agent of a big corporation, "Well, what will you pay me for my wheat today?" The agent looks up the city paper and says, "Wheat was down 1½ cents today, been too wet down in Taney county for three days now (no wheat from Taney county but that don't matter—it was wet down there) and so the farmer takes what he is offered or if he is game enough to gamble a little himself he holds his wheat and comes back to the same man later, doesn't set the price but takes then what the man will give or holds it longer to again let the same men set the price for him. But, I presume if the price of his products are set by somebody else he then will have a right to set the price for what he buys, but he dosen't. If he goes to buy anything he must pay the other man's price, and when he sells he must accept the other man's price. If the farmer isn't between the "devil and the deep blue sea" who is?

As I said before clothing is probably the next necessity to food or we will say wheat and corn. I can pick up my paper and find out just what wheat is worth, because I can see just what the gamblers were paying for it the day before, but I can't see what they were paying for overalls or blue shirts. Why? Why do we not grade overalls and shirts the same as wheat is graded; have us a clothing exchange; go there every morning and set the price for shirts for the day and swear, go mad, act crazy, pull out our hair and some of us go out and shoot ourselves because shirts went down so much we could not cover our margins. Or, if we don't want to make such public fools of ourselves, let us quietly go about our work like somebody, some big body, who is today buying cream and produce, and let us buy up the shirts or the material from which they are made and if we get big enough we can control the price. People don't do that. Why?

If large corporations and stock exchanges did not today control the markets of all farm products and some man should come along and suggest such a thing in the columns of The Missouri Farmer every reader would think him crazy and think the editor in the same box for printing such stuff. It would not seem possible. We would say that there are too many farmers—too great difference in the quality of the product, etc. We could find a thousand reasons why it would be impossible for any man or any set of men, no matter how many, to control such a thing as the price on staple farm products in such a magnificent big country as that in which we live. But we have grown up with this condition existing all about us! We have grown up with this yoke on our necks and we wouldn't know how to act without it, and we wouldn't know how to make our own prices on our products.

We are not called upon to give a thousand reasons why it would be impossible for men to control prices of farm products because we all know they already control them, but how about being called upon to give a few ways to overthrow the great octopus? Can we do that? Many have been suggested that sounded good, but none have so far worked. The time comes in the life of a farm crop sometimes when to tear out its enemies means to destroy the crop itself, and if the present condition is allowed by the American people, the American farmers, to continue the time will come when to destroy it will mean the destruction of agriculture; that is to say, the destruction of the condition will be the destruction of your business and mine. Of course, agriculture will always exist, but one generation will have to suffer greater than from war if the conditions we are now facing are not halted in the work they are undertaking and making such magnificent headway so far.

Albert S. Ennis.

International Harvester Manure Spreaders

"MOST machines handle crops—the manure spreader produces crops." There is a lot of food for thought in that sentence. When you have crops ready, you need machines for the harvesting, but before you can have crops you must have fertile soil. Your yields depend on how well you fertilize the soil.

In the choice of a spreader—your crop producer—you cannot be too careful. Avoid all chance of going wrong by choosing an **International Harvester** spreader—**Low Corn King, Low Cloverleaf,** or **Low 20th Century.**

I H C spreaders are built from careful designs based on rigorous field tests; strength in every part makes them last for years; they can be had with an attachment spreading 8 feet wide or more; they are low for easy loading; narrow for easy handling in yard, stable and field.

If your local dealer can't show you an **I H C** spreader, write us for our booklet "Why You Should Use a Manure Spreader," and when we send it we will tell you where you can see the machine. Don't buy until you have seen an **I H C** spreader.

TWO BAD WEEDS

A reader from Macon County, C. F. Depew, sends us two troublesome weeds and wants to know what they are and how to get rid of them. The first is the Bracted Plantain, a weed quite common in uncultivated fields, more particularly where the land is dry and rather poor. On land that can be cultivated the remedy is clean cultivation and manure. By making the land fertile the grasses and clovers will smoother it out or keep it in check at least. On rough land that is kept in permanent pasture it is a difficult problem. But we think by scattering manure over the pastures to induce a more thrifty growth of the grasses will keep it in check.

The other weed is sheep-sorrel (acetocella) a weed closely allied to sour dock. Like all other weeds this is best controlled by a rotation of crops, clean cultivation and enriching the land. Where the land shows acidity under the test liming would be helpful. For information about liming soils turn back to your files of The Missouri Farmer and read Professor Miller's articles on the use of lime.

In this suggestion let us say to our correspondent and to thousands of others situated similarly that about the best plan to rid the farm of weeds is to keep a flock of sheep. By close grazing until the blooming season of any particular weed is past most weeds can be killed out in a very few years. We know of no other way to fight weeds so successfully and at the same time to get a profit out of the work than to stock the pastures with sheep. In a certain wheat section of western Indiana back forty years ago it was quite common for wheat farmers to borrow a large flock of sheep to turn on the stubble fields after the grain was stacked. The sheep would soon clean the field of ragweed and summer grasses and leave the land in good shape for plowing. Plowing under weeds before the seed will grow is a better practice on cultivated land but on pastures nothing will beat a flock of sheep for killing out weeds.

YELLOW TREFOIL CLOVER

Our subscriber, Mr. J. H. Lipscomb, of Kansas City, sends us for identification a sample of yellow clover found growing in a lawn in the city. This is Yellow Trefoil, a small creeping clover that is sometimes mixed with alfalfa or other clovers and grasses. This clover may be known by its yellow blossom and its creeping habit of growth. We would not advise any one to sow it because our standard varieties are so much more profitable. The seed of Yellow Trefoil is used as an adulterant of alfalfa seed and the inexperienced can not detect the difference and hence in buying seeds it is a good plan to get a sample first and send to the seed testing laboratory at Columbia.

There are a number of splendid characters in "The Plunderer" which began in Aug. 1 issue—but by far the most interesting ones are "Bully" Presby and "Bill" Mathews. They are both giants and neither one knows such a thing as fear. In days gone by the mining camps of the West knew hundreds of such men and we feel sure you will follow them through this splendid story with the keenest interest.

The Missouri Farmer

VOLUME VII AUGUST 15, 1915 NUMBER 16

How to Make the Most of the Corn Crop

Geo. B. Ellis, Managing Editor

The farmers of Missouri have spent a lot of labor and other expenses in producing a corn crop this summer, and it is now about time to figure what they are going to get out of it. The corn crop represents more than one-half the value of all crops grown in Missouri and approximately one-sixth of the whole area of the state, including both improved and unimproved land, is annually cultivated in corn. There are a few farmers in the state who do not grow corn according to the United States Census, but these must be only the truck farmers near cities. Something like 241,192 farms report that corn is grown and the total acreage raised from year to year is from 7,000,000 to 7,500,000 acres. The man who grows thirty acres of corn yearly is therefore about an average corn grower.

Cost of Growing an Acre

Representatives of the Missouri Agricultural College have made investigations among farmers and they find that it costs under present conditions $13.52 to grow an acre of corn. This cost is divided as follows:

Man labor	$3.074
Horse labor	3.596
Seed	.275
Equipment	1.021
Use of land	5.164
Manure	.392
Total	$13.522

The above cost was obtained as the average from 357 acres and we think approximates very closely the cost of growing corn in any section of the state. One item, that for manure which represents the average for that expense on these farms, is entirely too low for the man who figures his cost on the basis of maintaining the fertility of his land for it will take very much more than 39 cents to replace the plant food removed from an acre by even a small crop of corn.

The department of agriculture in the August crop report estimates the corn crop of Missouri for this year at 184,000,000 bushels. Figured then upon this basis at the cost of $13.52 an acre the corn will cost the farmer when put into his crib December 1 about 55 cents a bushel. If we should allow the corn grower a reasonable profit, such a profit as any ordinary business man would expect, and then allow him pay for delivering the corn to the railroad station and the actual cost of replacing the fertility removed from the land it would take a price of at least 80 cents a bushel to make the farmer whole.

With these facts before us how are corn growers to get a profit? When manufacturers meet up with this kind of a situation they must either find a way to reduce the cost of production, to stop the leaks or wastage, or raise the selling price. Raising the selling price is out of the question for the farmer because under our present system he has little to say about what price he gets. The cost of production of corn so far as use of land, expense of labor, etc., is concerned will increase rather than decrease so it leaves only an increased yield or saving the waste open to us to remedy matters and it occurs to the writer that so far as this crop is concerned "saving the waste" should claim our attention at once.

The Great Waste We Must Save

The great waste in the corn crop is in the failure to utilize the forage to the best advantage. It has been determined by accurate experimentation that from 35 to 40 per cent of the feeding value of the whole corn crop is in the stalks, blades and husks. Thousands of farmers who have been saving the corn forage by putting it into the silo substantiate this statement and many of them are more liberal and say that they get double the value from the corn crop when they put it into the silo. Under certain conditions, I think the crop put into the silo may be worth double what the grain alone is worth and even more than double in drouth years when the relative amount of grain is light.

If these are facts then why is it that so many farmres will go along in the same old way and let 35 or 40 per cent of the feeding value of their corn crop go to waste when it could be saved by building a silo?

Several thousand silos have been built in Missouri within the last three years, a few have been in use for ten, fifteen and twenty years and so far as we know every silo properly built and filled has given satisfaction. About the only opposition we know of to the silo comes from men who have never used one or occasionally from a man who has made mistakes in building. No accurate census has ever been taken of the number of silos in this state but from estimates based on reliable data there are probably between eight thousand and ten thousand silos now in use. For every farm with a silo then there are twenty-seven or more without one.

Silage Is Canned Corn

Fifty years ago the housewives of this country knew little about the process of canning fruit and vegetables and the bill of fare was consequently limited to a very plain diet during the winter months. Today there would be thousands of people in the cities facing starvation were it not for the stock of canned meats, fruits, vegetables and milk found available in the stores. The process of siloing crops is the same in principle as the canning of fruit, and in a few years it will be as hard to find a live stock farm without its silo as it is now to find a pantry or a grocery store without its supply of canned food.

Largely because of the use of the silo the state of Wisconsin has become the leading dairy state of the Union in spite of the superior advantages of climate, variety of crops and pastures that we possess here in Missouri. More than fifty thousand silos are in use on the farms of Wisconsin, and as a result their annual commercial dairy product is four or five times what we produce. These are facts which speak more forcibly than any words of mine. The dairy department of the University of Wisconsin gives the following reasons why farmers should build silos and build them now to save the present corn crop:

The silo promises a safe place to store corn that is overtaken by frost when in the milk stage. The crop will then make a fairly good quality of silage if it is cut into the silo at once.

The silo furnishes succulent, palatable feed of uniform quality, that is always near at hand.

The silo preserves the corn crop with the minimum amount of loss, as the entire plant is made fit for food.

The silo doubles the number of dairy or beef animals that can be kept on a farm.

The silo economizes space, time, and building costs in providing storage room for the crop.

The silo equalizes the supply of feed, by carrying a surplus over, in good condition, from one year to another.

The silo can be used for ensiling clover or alfalfa during a spell of wet weather, when it would be impossible to cure it for hay.

The silo furnishes the most economical, convenient feed for supplementing short pastures during a period of drouth.

One of the great losses Missouri farmers have sustained during the last few years has been the sacrifice of live stock on account of the failure of pastures. This accounts largely for the extremely high price of calves and feeding cattle. We are informed buyers are offering in some counties from $30 to $40 a head for weaning calves but what does this matter to the thousands of farmers who sold their cows because of our recent drouth years and now have no calves for sale? The wisest thing a man can do who is raising cattle either for dairy or for beef to protect himself against short pastures and a forced sacrifice of his cattle is to build not one silo but to build two, one for winter and a smaller one for summer. If the pasturage is good and the silage is not needed at once it may be kept over for another year like canned fruit in the pantry.

J. Kelley Wright, who has traveled through every county in Missouri and gathered first hand information from farmers gives some substantial reasons for having a silo:

"When an effort is made to feed some leguminous hay along with silage it may at first seem a little expensive. This in itself will, in all probability, suggest to us that we might just as well grow our own legume hay. Not all can grow alfalfa, but most of us can grow clover. If we can not get clover to grow well, then we will try cowpeas or soy beans. And when we have begun to grow such crops as these in a good rotation on the farm their value will be seen not only in the ration but in the good they do the soil.

Silage Makes More Feed and More Manure

"Again, silage and some legume hay, when fed together with corn, makes much better quality of manure than that coming from corn, corn fodder and timothy hay. Of course, any kind of manure is better than none at all, but since none of us have enough manure to cover every field, it behooves us to improve the quality, especially if it can be done by a better and more efficient and more profitable system of feeding. Then, too, we have more manure. Silage feeders find that since they save practicaly all of the corn plant when it is made into silage they have a greater abundance of feed. The silage is palatable and animals really eat more than they do when silage does not form a part of the ration. Of course, this means more manure. Another item to be considered in connection with the quality of manure is that of concentrated feedstuffs, rich in protein. Such feeds as cottonseed meal, linseed-oil meal, bran, shorts, etc., are often spoken of as concentrates. Nearly every man who feeds silage feeds, in addition to a legume hay, some one of the feeds just mentioned. This improves the ration very greatly, and increases the value of the manure.

"Missouri farmers are rapidly meeting conditions confronting them. It is not hard for a farmer to see that when he has on his farm twice as much manure as he used to have, and that of a better quality, he needs a manure spreader. The judicious use of a manure spreader never was a detriment to any farm. Seventy-five per cent of 300 Missouri silo owners use manure spreaders, returning to the soil at least a part of what it produced.

A Protection Against Drouth

"Again, during seasons like those of 1901, 1911, and 1913, silage is indeed timely and valuable. Dry weather always cuts the grass short. Such a condition becomes serious in years like the ones mentioned. Following years like these there is always a period in the spring of the next year (it happens nearly every spring) when feed is scarce and high priced. The

man who has plenty of good silage does not worry about prices or scarcity of feed. It has happened more than once that a man, a general farmer, has fed $150 or $200 worth of silage and a little grain, bringing his stock through the winter in good shape, while his neighbor fed 25 or 30 tons of clover hay instead, worth from $16 to $18 a ton, and some grain besides to accomplish the same results."

What Kind of Silo to Build

There are several types of silos in use and all of them giving satisfaction when properly built. The kind of silo any particular farmer should build will depend largely on two things: Local conditions as to materials and the farmers finances. In localities where good sand and gravel are to be had for the hauling the concrete silo may be built about as cheap as any other form, and then it has the advantage of being permanent. In other localities where sand and gravel must be shipped in and then perhaps hauled six or eight miles from the railroad the concrete silo is an expensive structure. The hollow tile silo is also a very permanent structure but is high priced when compared with a wood or wood and plaster silo. It is not within the scope of this article to discuss the different types of silos but any farmer who is thinking of building a silo should at once write the U. S. Department of Agriculture, Washington, D. C., the College of Agriculture, Columbia, Mo., and the State Board of Agriculture also at Columbia, and request them to send their literature on silo building and on feeding silage and from the information given in these bulletins a decision as to kind of a silo to build can be intelligently made.

Do Not Build Too Large

An important matter is not to build the silo too large for the amount of stock kept. It is better to build two small silos on the average farm than to build one large one, for in this way any silage not fed out in winter can be utilized without waste the next summer. For mature cattle to be fed a liberal ration of silage supplemented with other feed, a safe allowance will be three tons for the six months winter season. This is an allowance of about 30 pounds daily for each individual. The approximate capacity of a round silo well filled with good corn is as follows:

Diameter	Height	Tons Silage
12 feet	24 feet	49
12 feet	28 feet	61
12 feet	30 feet	68
14 feet	28 feet	83
14 feet	30 feet	93
14 feet	36 feet	130
16 feet	32 feet	131
16 feet	36 feet	155

Most any field crop grown in Missouri can be made into silage but the most dependable crop of all perhaps is corn. The better the corn, that is the more grain it has, the better will the silage be that is made from it. The best time to cut corn for the silo is when it is fully mature, about the time it is ready to put into the shock. in normal seasons this will be when the grain is well dented and the shuck dry with the leaves and stalk yet green. For sorghum it has been found that the seeds should be fully ripe and hard before it goes into the silo. If cut greener than this the sorghum made silage will get too sour and lose much of its feeding value. Some farmers who have learned the value of silage and the convenience of feeding it fill the same silo two or three times. It is filled in the fall and the rest of the corn put into the shock and after the silage is fed out it is filled again from the shock corn. The only precaution necessary is to wet the dry cut fodder thoroughly when filling. The advantage gained in this is that it saves going to the field every day to haul shock corn, makes the feeding much easier and then it saves the fodder from deterioration from late winter and spring rains and in addition the silage made from the fodder is more palatable and is eaten with less waste. It is no longer a question whether a farmer can afford a silo but the question is how can he get along without it and compete with farmers who have one?

HOW TO GET RID OF HOG CHOLERA

J. W. Connaway, D. V. S., M. D., Veterinary Department, College of Agriculture and Experiment Station, University of Missouri.

[This article is a continuation of the articles in previous issues and will be continued until the whole subject of hog cholera control is thoroughly discussed. We suggest that every swine raiser who reads The Missouri Farmer should file away all these papers containing this article and they will then have the most valuable treatise on hog cholera that has been published.—Editor]

Parasites of Swine

It is a matter of common observation that herds of hogs that are badly infested with worms and lice are less resistant to cholera than herds that are kept free from such parasites. The percentage of loss from cholera is greater in wormy herds, and the serum treatment is less effective. And when such herds are vaccinated by the serum-virus method, a larger per cent of the animals contract cholera in a fatal form, than in herds that are practically free from worms.

Worms when present in considerable numbers, in the stomach, intestines or lungs produce an irritation of the mucous membranes which frequently results in local congestions or inflammations that are favorable to the passage of the hog cholera germs into the blood.

There are a dozen different kinds of worms that infest hogs. But the ones most often found, and that cause irritation and inflammatory conditions that increase the susceptibility of hogs to cholera are the following: (1) Common round worm (Ascaris suis); (2) Thorn-headed worm (Schinorhynchus gigas); (3) Lung worm (strongylus paradoxus); (4) Kidney worm (Stephanurus dentatus).

The first named worm, the common round worm, when full grown, is from 6 to 7 inches long and about 3-16 of an inch thick. But smaller specimens, of different sizes, are often found in large numbers in the same hogs. These worms are most frequently found in the small intestines, but occasionally a few crawl into the stomach, and even into the oesophagus and out of the mouth, causing violent coughing from tickling the throat. A few of these worms when quite small may also pass from the small intestine up the gall-duct and into the liver. They sometimes completely obstruct the gall-duct and prevent the bile from passing out into the small intestine, thus producing a very yellow or jaundiced condition of the skin and fat of the affected hog. This yellowness of the skin is so noticeable in white skinned hogs, that the presence of these worms in the gall-duct and liver can often be predicted before cutting into the carcass. These worms are sometimes so numerous in pigs as to cause severe digestive troubles, and even obstruction of the bowels. I recall finding over fifty worms in a 25-pound pig; and a mass of worms had obstructed the bowel at one point.

The **thorn-headed worm,** about the same size as the common round worm, also infests the small intestine; but it fastens itself to the wall of the gut, where it remains until fully matured. The head of this worm is provided with barbs or hooks pointed backward, so that when the head is thrust into the wall of the gut, the worm cannot be detached without considerable force. The irritation caused by the rough barbed head of this worm produces a small fibrous tumor, which is quite noticeable on the outer surface of the small intestine, as a white, raised lump, from a fourth to a half inch in diameter. The head of the worm is imbedded in these tumors. Sometimes a dozen of these worms will be found attached to the wall of the small intestine. Hogs thus infested are less resistant to cholera, because of the irritated bowels. When cholera atacks hogs with worm-infested bowels the signs of the disease are often found in this location, in the form of hemmorhages or an acute inflammation of the mucous membrane —or in the chronic form of ulcerations. It is therefore a wise precaution to prevent hogs from becoming infested with intestinal parasites.

The next worm mentioned is the **lung worm** (Strongylus paradoxus). This is a small thread-like worm an inch to an inch and a half in length. And is usually found in clumps of a half dozen or more in the smaller bronchial tubes, in portions of the lungs that show evidences of inflammation. On cutting through the inflamed or solid portion of lung so as to cut across the small air tubes, masses of the worms are sometimes exposed, protruding from the small bronchi. A better way is to cut along the trachea by means of a hevy pair of scissors, and follow the air tubes down into the inflamedarea. Masses of mucous and worms will be easily found, if a serious infestation exists. This lung infestation is sometimes found in apparently healthy hogs that are butchered; the animal having shown no loss of appetite nor evidences of illness, except possibly an occasional slight cough. Yet when the animal is slaughtered the lungs may show small areas of solidification as large as a hen's egg or larger. And the worms mentioned may be found in these small localized areas of bronchopneumonia. Should herds thus infested with lung-worms be exposed to cholera, or be vaccinated by the serum-virus method for protection against cholera, the already irritated lung would supply a favorable condition for the development of acute cholera with serious pneumonic complications. Hence the importance of keeping the hogs free from these lung parasites.

The **kidney worm** (Stephanurus dentatus) has never been accused of carrying cholera; but when we consider that this is a worm that bores through the tissues of the hog, and finds its way to various parts of the body, the kidney fat and sometimes into the kidney and liver, producing abscesses in these organs, it is not at all improbable that in the migrating stage of this parasitic worm it produces minute lacerations and inflammations in the intestinal walls, which are favorable to the passage of hog cholera germs into the blood. At any rate the presence of these parasites in the tissues of the hog cannot help but lower the vitality of the animal; and every precaution should be taken to prevent the pigs from becoming infested with these worms.

There are other worm that infest hogs, that are not regarded as dangerous to the health of the animal, unless present in excessive numbers. There are four and possibly five kinds of small parasitic worms that infest the stomach. Some of these lie free on the mucous surface; and probably subsist on the food contents without irritating the walls of the stomach. One, however, form small cysts in the walls of the stomach; and another is a blood sucker (Strongylus rubidus) which causes severe inflammation of the stomach walls. Fortunately this latter parasite is rare in America, and on that account has but little significance for us so far as cholera is concerned.

There are also three or four small parasitic worms that infest the intestines, but which do not appear to cause any serious irritation of the intestinal walls. Of these, I will mention the whip worm (Trichocophalus crematus) found in the large intestine and caecum. This worm is from 1½ to 1¾ inches long. But the greater part of its body is so slender that the worm is easily overlooked, when the mucous surface is examined. The head portion resembles the lash of a whip, while the posterior portion, short and thick (containing the ova) represents the handle of the whip. The head of these worms is embedded in the mucous coat of the caecum or large intestine. And the possibility exists that they may, if present in large numbers, cause sufficient irritation to produce favorable points of entry for the hog cholera infection into the blood. It is in this region that hemorrhages and chronic ulcerations often occur in cholera.

Somtimes pin worms (small white worms ½ inch long) occur in considerable numbers in the large intestine.

Trichina and tape worm cysts are so rare that their possible relation to hog cholera, as contributory causes, scarcely needs mention.

Prevention: No one believes that any lot of the worm parasites mentioned are in any way beneficial to the hogs. And their destruction is to be desired. This can be accomplished easiest by good sanitary farm management. It is better to keep the worms out of the hogs than to try to kill and expel the worm, after the hogs are badly infested. The latter task is sometimes a difficult one. Nearly all these parasites pass a part of their existence outside of the animal body, in the barn-yard manure and litter. And if these barn yards are given proper attention most of the worms and their eggs can be destroyed, so that the pigs will not become badly infested. The same disinfection that was recommended to destroy the germs of hog cholera, on the hog lots, will also destroy the worms, eggs and embryos of all these parasitic worms, when they have escaped from the body of the hog. The free use of fresh lime on the hog yards is the best worm medicine known, the hog does not have to take the dose; the worms and the eggs and embryos get it instead. The water supply should also be protected to prevent hog dung, worms, and worm eggs from washing into the ponds.

Worm remedies: Prevention of worm infestation is more desirable than treatment; and the measures recommended for hog lot sanitation will be a great aid. But occasionally internal medication will be necessary. The following remedies and measures are recommended:

(1) A mixture of equal parts of salt, sulphur or hyposulphite of soda, Glaubers' salts and copperas (iron sulphate) and a double portion of wood

charcoal is a good laxative tonic, which also has vermicidal properties. It is helpful in destroying the eggs and embryo worms in the stomach and intestines in the early stages of infestation. The mixture is relished by hogs, and it can be kept in a trough under shelter where the hogs can partake of it at will. The ingredients should be thoroughly pulverized and well mixed.

Experiments made at this Experiment Station showed that "blue stone" (copper sulphate) was more efficacious in destroying the thorn-headed worms than other drugs that were used. It can be substituted for the "copperas" in the above mixture, using half the quantity.

(2) **Turpentine** is useful as a vermicide. It can be given in tablespoonful doses to a hundred pound shoat. It should be fed in greasy slop or milk.

Turpentine is absorbed to some extent, and eliminated in part through the lungs, as well as the kidneys. It stimulates the mucous secretion of the bronchial tubes, and aids in the expulsion of the "lung worms."

(3) **Santonin** is one of the most efficient worm remedies; but is somewhat expensive. It can be given to hogs in doses of four to six grains, to the 100 pounds of live weight. It is usually combined with calomel and bicarbonate of soda; santonin 6 grains, calomel 4 grains, bicarbonate of soda, 1 drachm. By adding powdered areca nut, in 1 drachm doses, the quantity of santonin and calomel can be reduced a half.

When giving this combination the pigs should not have access to the first mixture containing salt; since calomel and salt may combine and form corrosive sublimate, which is very irritant and liable to salivate the pigs, and ulcerate their bowels.

Before giving the worm medicine, the pigs should be grouped into bunches of ten to a dozen, according to size, so that the smaller pigs will not be robbed by the larger ones of their proper portion of the medicated food. The pigs should have no food, except water, for twelve to eighteen hours, so as to empty the bowels.

The quantity of the medicine necessary for each lot of ten or twelve pigs can be calculated with sufficient accuracy, from a rough estimate of their combined weight. The medicine should be stirred into a thick slop made of shorts and water. In order to ensure its more even distribution through the slop the dry powders should first be thoroughly mixed with a handful or two of dry meal, and this can be sprinkled into the slop while it is being stirred. After feeding the slop, keep the pigs in the quarantine pen for twelve hours, or longer, so that the expelled worms will not be scattered over the hog lots. Some of the expelled worms will not be killed and may contain numerous fertile eggs. Scatter air-slacked lime over the floor of the quarantine pen to destroy the expelled worms and their eggs.

It is a good practice where coal is burned, to keep in the corner of the hog lots a pile of coal cinders. The bits of unburned coal, and the iron and other salts contained in the ashes, are better worm remedies than many of the "hog powders" which the farmers pay out money for. If a half bushel or more of crushed lime rock is added occasionally to the cinder pile, it will be helpful in strengthening the bone of the pigs and brood sows that eat of it. No coaxing is required to get the hogs to attack the cinder pile. But a little salt and shelled corn thrown upon it makes it more attractive.

Lice and Hog Cholera

In combating hog cholera, the herd that is kept free from lice, is less liable to contract the disease than a herd that is badly infested with these irritant blood suckers. The resistance of lousy pigs is greatly weakened; and the losses from cholera in such herds is usually quite heavy. The following measures of prevention and treatment are recommended:

Kerosene Emulsion is very effective in destroying lice. It is made as follows: Dissolve a half pound of hard soap in a gallon of hot water. The soap is dissolved more quickly by cutting it into thin slices. When the soap is completely dissolved, add two gallons of kerosene. The kerosene is added little by little and the mixture is stirred vigorously until a permanent creamy emulsion is formed. The mixing is made easier by churning up the fluid, by means of a hand spray pump. The emulsion thus made can be kept for a considerable time by pouring it into jugs and corking tightly. For use in killing lice on hogs this emulsion is diluted with 15 to 20 volumes of water. It is stirred or churned into the water so as to make a uniform mixture. The diluted emulsion is applied to the hogs by means of a sprinkling can, or a spray pump. The hogs that are to be treated should be put in a pen that is small enough to crowd them well together; so that the rubbing of the aniamls against one another will ensure a thorough smearing of the emulsion into the hair of every hog. The bedding places should be thoroughly sprinkled or sprayed, with the emulsion. It is a good practice to clean out and burn the hog bedding frequently.

Crude petroleum oils: The lighter oils are now finding favor with many swine breeders and feeders. It is a cheap and effective means of destroying lice. And can be applied in the same manner as the Kerosene Emulsion. The heavier oils are objectionable because they "gum up" the hair. When sprinkled over the hog beds, the crude oil not only kills the lice, but it keeps down the dust and prevents bronchial irritation, and the resulting coughs, and makes the hogs less liable to contract cholera.

Dipping tanks may also be utilized by filling them to a proper depth with water, and adding a layer of oil 3 or 4 inches deep. Where concrete hog wallows are in use, it is advisable to pour in a little oil occasionally.

The grade of oil recommended will cost from $3.50 to $4 for a 50-gallon barrel, and probably less when several barrels are purchased by farmres' clubs.

(Continued in the next issue)

TO CHECK THE HESSIAN FLY

It is not necessary to call the attention of wheat raisers to the great loss caused by Hessian flies this year for the threshing machines are telling that fact much more forcibly than anything The Missouri Farmer could say. But unless we try to get rid of the pest it may do as much or more damage to our next year's crop than it did to this one. Paul V. Maris, the county agent of Saline County, is sending out some good suggestions to the farmers of that county. He says:

1. Most important of all, plow under all wheat stubble good and deep, except that in which there is a good stand of clover. There is too much green vegetaation to permit burning. It is easier to trap the flaxseed than the living fly.

2. Follow the plow with the harrow. This will close up the open spaces from which the fly might escape and will, also cause the wheat in the ground to germinate and grow at once.

3. Remember that with these precautions some flies will escape, both from clover stubble and from fields where there is an effort made to cover them up. Therefore, keep down all volunteer wheat by frequent discing or harrowing and thus destroy the seeding place of the fly. If the volunteer wheat gets ahead of the disc, rebreak the ground by shallow plowing just ahead of wheat seeding. Above all, have the fields clean from growing wheat when seeding starts.

4. Avoid putting in wheat after wheat as far as possible.

5. Observe the fly-free date. That date is October 10 (for Saline county). There may be eggs deposited after that date, but freezing will likely destroy most of them before they become brown, winter resistant flaxseeds.

6. Urge your neighbor to observe these rules also, for without co-operation, we fail; with co-operation, fly loss can be quite largely eliminated.

WINTER DAIRYING

In many sections most of the cows freshen in the spring. The more observing and careful dairymen, however, having found that winter dairying has many advantages, are breeding their cows to drop the calves in the fall. The following are some of the advantages of winter dairying:

First, higher prices are obtained for milk and cream. As the usual season for cows to freshen is the spring, milk has always been plentiful during the early summer and scarce and higher during the winter.

Second, milk and cream can be handled in cold weather with less danger of souring, so there is little loss on account of milk returned from the creamery.

Third, the amount of labor on the farm is better distributed throughout the year. If the cows freshen in the spring, they are in full flow of milk and need the best care when work in the fields is more pressing. On the other hand, if the cows calve in the fall and are milked during the winter, the farmer can give them close attention, has more time to study the problem of feeding, and can give his men employment all the year and in that way get better help.

Fourth, the lactation period is lengthened and the amount of milk given during the year increased. Cows that freshen in the spring milk heavily while grass is good, but as the pastures dry up the flow of milk falls off and with the approach of winter the cows are nearly dry. If they freshen in the fall, they should at once be started on a good winter ration, and when they have been milked six months it is time to turn them to pasture and for a time the flow of milk will be nearly as great as that from fresh cows. Recent investigations by experiment stations verify this observation.

Fifth, fall calves can be raised better than those born in the spring. Young calves should be fed on milk for several months, after which they must be weaned and fed on solid food. If they are born in the spring, they will be tormented by flies all summer, they may be neglected because of the farm work, and when it is time to wean them they must be put on a dry winter ration. Fall calves come at a time when the dairyman can give them the closest attention, and when weaned they can be put on grass at an age when an easily digested and nutritious food is most needed.

As more milk can be produced, higher prices obtained, the labor more evenly distributed throughout the year, and better calves raised, winter dairying offers the best returns to producers.—Weekly News-Letter.

Worth Investigating

Elsewhere you will find the advertisement of the Kramer Rotary Harrow manufactured at Morton, Ill., and we suggest that every farmer who reads this drop a postal card to the company and ask for their descriptive literature. This is a new idea in seed bed preparation. It helps to prevent the escape of soil moisture and does away with clods. It is worth a postal card to investigate. When you write mention The Missouri Farmer.

Which is the Best Silo?

Mr. Harry Pugh, manager of the Beatrice Creamery Company, Topeka, Kansas, took a silo "census" of his state. In an article in the "Farmers' Mail and Breeze" of March 14, 1914, he said of it:

"I have taken considerable trouble to find out the actual number of silos in Kansas. After making all the inquiries through reliable sources that it was possible to make, I found that the following figures are fairly accurate:

"4,700 wood stave silos; 400 wood 2x4, known as Common Sense; 50 built of floorings; 5 Buff Jersey type; 160 monolithic concrete; 125 metal lath; 100 cement-stave; 20 hollow tile; 100 galvanized iron; 40 pit, or hole-in-the ground, and 15 brick."

Of a total of 5,715 silos in the State of Kansas, 5,155 were wood!

Kansas has given all types of silos a thorough try-out, and has determined which is best. Kansas farmers are prosperous, and can afford to buy the best.

Of every ten silos Kansas farmers have bought, NINE ARE WOOD!

And it's the same way with a granary.

Everybody knows grain keeps best in a wood container. You can build a Southern Yellow Pine storage bin or granary for 4 cents a bushel capacity. In these days of soaring wheat prices, how long will you have to hold your grain to make a profit on the building investment?

Investigate! Fill out the attached coupon and mail—our publications are FREE. We have nothing to sell to you.

"JUST A LETTER"

A fellow ought never to get it into his little head that he is the only guy really worth while, and that where he lives is the only place that is really fit to live. This country is so tremendously big, and I can say from what little I have seen of it, that there really are a big lot of fine folks in it and a lot of good places to live.

As I am writing this, August 2, 1915, I am in the fine cool writing room at the Claypool Hotel in Indianapolis, Ind. It was pretty hot out on the street "rubbering" the passers by, so I bought me a tablet to write upon and am busy, maybe doing no more good than looking at the pretty girls "as they pass by" and that perhaps does no good any way for "None of the girls loves a fat man." So what's the use?

I left Sedalia on the 26th for Charleston, Ill. Filled date on the 27th and took night train for Cincinnati where I arrived on time. At 1:40 p. m. took interurban for Georgetown, O., to visit my old time friend, C. D. Lyon. Spent two days with him and how we did jabber and eat. I have always had a "weakness" for good country cured ham, and C. D. knew it, and ham found its way to the table for most every meal.

I found him feeling fine and saw good crops on most every spot on his farm. It was interesting to know that while his farm has been in cultivation for over one hundred years, there is no "worn out land" on it. Yet the hills are so steep that I would not know how to go about it to farm them. That part of the county "sure stands on edge." His system has and is producing gratifying results. I was sorry I did not have my camera to take some pictures of the tobacco covered hills. His home is in view of the "blue hills of Kentucky."

After this most enjoyable visit I went back to Cincinnati, where I remained till the next morning when I headed for Wilmington, Ohio, to fill a date on the 31st. Found a great audience at that place, but when I had talked 45 minutes a storm came up that made more noise and bluster than I could make. So for 20 minutes we let the storm occupy the entire "platform." When it was done I resumed my speech and then the "question box" took considerable time. Found a dandy good bunch at Wilmington. Met a former acquaintance there that I got well acquainted with at the National Corn Show at Omaha.

"I START YOU AT $900.00 PER YEAR (Uncle Sam)

That is what the U. S. Government pays its Railway Mail Clerks at the start while promotion is rapid. You have pleasant work and a position for life.

ATTEND ON CREDIT

We pay railroad fare and allow you to pay us our tuition as the government pays you.

No high school work necessary, just an ordinary education together with the special training that we give you.

Write for free catalog.

CHILLICOTHE SCHOOL OF CIVIL SERVICE

63 McNally St., Chillicothe, Mo.

I took auto from W. at 5 p. m. for Xenia, about 10 or 12 miles away, and the price was 25 cents. How could it be done? Rock roads of course. Left Xenia about 6 p. m for Dayton on interurban. Stayed the night in Dayton and at 9 a. m. took interurban to Richmond, Ind. Left that town at 3:40 for Indianapolis where I arrived at 6 p. m. Sunday I will go to Shelbyville, Ill., for my next date and will take interurban out of here and go on that as far as Paris, Ill.

I have not seen much but rock roads for wagons and autos. Electric lines everywhere, on which the people can "come and go" most any old time.

Do you think you live in the only place worth while even though that place is Missouri? Good as it is, it would be a lot better if we had more rock roads and more electric lines, especially, reaching into those thousands of places that have no facilities for marketing what they might grow.

Crops most all along are good, and when one sees all I have seen in Ohio and Indiana it makes me think that these two states are just as good as can be found.

Just awhile ago I was on the street killing time and concluded to hunt up the secretary of the state bankers association. I remembered that his name is Smith but could not recall "which Smith." So I stepped into the Indiana National Bank and passed along a row of bank officials or clerks till I came to the last one. I stepped up to him and asked the name of the secretary of the state bankers association. He put out his hand and said "His name is Andrew J. Smith, Mr. Jordan, how are you?"

You see I attended their state association meeting two years ago and he remembered me.

I had a fine little visit until some persons came to him to attend to some business matters, when I took my leave, and came back to the hotel to drop these lines to The Missouri Farmer folks to whom I hope I can write more often than I have been able to do in the past three years.

S. M. Jordan.

CORN IS KING

Corn is King of all the crops. Over 20% of all the improved farm land in the United States is annually devoted to the growing of corn. In 1914, 105,000,000 acres were planted to corn in this country, producing 2,700,000,000 bushels which brought the growers $1,900,000,000. For nearly 50 years the land planted to corn has been equal if not greater than the acreage of all other cereal crops combined.

Corn is the universal crop. In 1914 the world's crop amounted to more than 3½ billion bushels, grown on 170 million acres of land. United States produced two-thirds of this tremendous crop. In 1868, 49 years ago, corn brought the American farmers $411,000,000, and for 49 years since, corn has steadily increased in acreage and value, never once falling below this figure.

The annual corn crop exceeds cotton by nearly a billion dollars. In 1913 the cotton crop brought $800,000,000; hay $797,000,000; wheat $610,000,000; oats $440,000,000.

Wherever corn is grown there you find rich prosperous communities. Corn is grown in every section of the United States. It was but a few years ago that we thought Northern Iowa was too far north to produce profitable crops of corn, but South Dakota is now numbered among the corn growing states with an annual yield of 75 million bushels. In 1913, Canada produced 17 million bushels.

Notwithstanding the immense amount of corn produced in this country, we imported in 1913, 5 million bushels from Argentina, South America.

In Argentina corn culture has in recent years made great strides. From 3 million acres in 1900, the planting has been rapidly extended and a recent estimate made by the Argentine Department of Agriculture puts the land seeded for the crop maturing in the spring of 1914 at 10,250,000 acres.

Corn culture in Europe is largely centralized in a group of countries comprising Austria, Hungary, Roumania, Servia, Bulgaria, and in the southern governments of Russia. In this territory upwards of 20,000,000 acres are planted annually and the normal yield is approximately 500 million bushels. Over a million acres are devoted to growing this crop in the Philippines and upwards of 130,000 acres in Japan. We begin to realize what a great crop is corn when we learn that in 1914 the corn crop in the United States would build seven Panama Canals. The Panama Canal cost approximately $300,000,000 and is the greatest engineering feat of the age. The attention of the world has been attracted by its greatness, yet every year the farmers are growing 1¾ billion dollar crop and we hardly give it a second thought.

The feeding of the corn crop is another important matter. There are about 100,000,000 people and over 200,000,000 farm animals in the United States, including cattle, horses, mules, sheep and swine that eat corn in some form every day in the year. Corn furnishes a great variety of feed and food for man and animal. Take away wheat, barley, rice, and oats, and corn will completely substitute them all, supplying our needs with meal, hominy, syrup, starch, corn sugar, oil, alcohol and 150 other preparations.

For centuries our domestic plants have been bred for certain purposes and as a consequence certain parts of the plant are abnormally developed. The selection, in the case of corn, has been to secure more grain, not a greater per cent of stalk. The result is that an ear of corn weighs as much as the stalk under ordinary conditions. When a highly bred plant is subjected to unfavorable or even to normal conditions, the first thing to suffer is that quality which has been most abnormally developed. In the case of corn, if the care is poor we may obtain two-thirds of a crop of stalks, but less than one-half—possibly but one-third of a crop of grain.

Corn requires much greater care to prevent deterioration than most other crops since it is a comparatively new crop, as we know it today, and it's characteristics have not been so thoroughly fixed through centuries of breeding, as have those of many grains, but for the same reason it is also much more susceptible to improvement by proper treatment.

By intelligent selection and breeding, corn has been improved in the past few years far beyond our greatest expectations. Corn is yet in the plastic stage of its development and for that reason, it adapts itself readily to new conditions, responds quickly to good treatment and gives better returns for the efforts put into it than any other crop that grows.

Upon the great fundamental law that "Like produces like," rests all human progress. That "poor seed" means a "poor crop" no one will question, but it is not so fully recognized that unless great pains be taken to plant only the best seed, the crop will gradually deteriorate, or "run out," as we often say.

Corn has been taught, talked, preached, printed, painted, demonstrated and advertised in every agricultural country of the world. Thousands are teaching it today. Hundreds of corn demonstration trains have penetrated every section of the country in the past 15 years. There are corn demonstration farms everywhere. Thousands of corn clubs have been organized, and are now at work. There are corn shows, corn picnics, corn growing contests, and corn schools but still with all of the work done by our educational institutions, bankers, manufacturers and farmers for the improvement of corn, the average per acre yield in the United States is less than 26 bushels—not half a crop.

Poor seed is the greatest cause of the poor yield of corn. Just one small 8 oz. ear of corn added to each hill will raise the average in the United States to 52 bushels per acre, double the yield and value of the crop and add about $1,700,000,000 to its total value.

To summarize:

1st. Corn from a standpoint of acreage yield and value exceeds every other crop.

2nd. Wherever corn is grown, there you find high priced land and prosperous people.

3rd. No other crop can replace corn, but corn can readily take the place of any other grain crop.

4th. Corn is put to a greater number of uses than any other crop that grows.

5th. There are greater possibilities for improvement, yield and quality of corn than any other crop.

The most important needs for a greater yield and better quality of corn are:

1st. Better care and testing of the seed.

2nd. Campaigns of education for home consumption of home grown corn. Better methods of cultivation. Organization of Boy's Corn Clubs, etc.

[Extract from address to be delivered at the Universal Corn Convention and Exposition under the auspices of the Top Notch Farmer's Club, Panama Exposition, by Professor P. G. Holden, of the International Harvester Company.]

PRACTICAL FARM PAPERS

My only excuse for my long absence from your columns is the statement that I have had too much work on the farm to permit much writing.

Sam Jordan was with us three days last week, and to say that we enjoyed every minute of the time is to put it mildly.

Sam compliments our farming by saying that it surprises him to find lands which are rolling and some pretty steep, producing first class crops, after having been cultivated over 100 years. He says that our crops are as good as he has seen anywhere, and as free of weeds, but owing to the very wet July, we have more weeds than usual. It has been one eternal fight with weeds since June 15, and while they have not greatly damaged crops, they have lessened yields in some places.

June 2 I planted five rows, each 65 feet long, to the new crop Sudan grass, and today, August 6, Professor Hugh B. Gordon, of the Texas Agricultural College, photographed the plat, which averages nearly eight feet high, with some plants measuring over nine feet. The five rows are 26 inches apart and

the seeds were drilled about ten to the foot, but the plants stooled out until the plat is nearly solid. I am inclined to think that this grass will be grown in place of millet and the sorghums to a great extent, as it may be cut for hay fifty days after seeding, making a second crop in forty days. A small plat sown broadcast, late in June, will be cut next week, it now being four feet high.

Wheat was the poorest crop in years owing to the dry April and May, followed by wet, but some damage was done by Hessian fly. When Geo. B. Ellis had me as his hired hand at institute work, I tried to impress the fact upon Missouri farmers that they were sowing their wheat too early, and that some time the fly would damage them severely, and Mr. Jordan tells me that they had the damage this year. We cannot safely sow wheat until October 1, and I think the same date is right for Missouri. Of course the extreme northern part of the state will allow earlier seeding, and the southern part later seeding, but for the central section October 1 is about right.

The mail informs us that Doctor D. F. Luckey will spend a night with us next week, when he speaks on tuberculosis at our Chautauqua. Jordan's visit was between two Chautauqua dates, so our plain old farm home is honored by reason of the meetings near us.

There is a boom in Grange work here and the deputy phones me that we will re-establish a Grange a mile and a half from my home. I have been a member since 1874, but have not been at a meeting in six years.

We have the most wonderful garden and truck patch in years, everything more aboundant than in years and our corn and tobacco promises an enormous yield. I never saw as large a crop of early potatoes, and only once before do I remember of having sweet potatoes, Jersey yellow, large enough to use the first week in August.

Georgetown, O. C. D. Lyon.

OLEO INVESTIGATION

Twenty-seven million dollars in stamp and special taxes is the grand total which has just been discovered by the commissioner of internal revenue to be due the government. When in 1902 the law putting a tax of 10c on each pound of colored margarine was passed, the oleo manufacturers and oleo dealers raised a big cry about being forced out of business. That this has not been the case is proven by the finding of the department of internal revenues which has just submitted its report to Secretary of Treasury McAdoo. A good part of 200,000,000 pounds of oleomargarine was sold to dealers as uncolored oleo and colored by them and sold to the consumers as butter. The usual method employed in evading the stamp tax is to buy some six or eight tubs of oleo, paying the tax of $10 per 100 pounds, but taking great care not to let the tubs become emptied, as under the law the stamps on these butter tubs are not to be cancelled until the vats are emptied completely. The dealers have made it a practice to allow their tubs to become empty within only a pound or two, at which time they would refill their vats with oleo colored with vegetable oil in a back room of their establishment. Thus they sold the untaxed product for the same price as either the taxed or more often real butter. Where the government was to have received 10c per pound, it only received ¼c, and thus in the 13 years of this law lost according to the report the immense total of $27,000,000. In many cases the manufacturers themselves would color the margarine with palm oil, and by various routes ship it from the factory, running the gauntlet of United States revenue inspectors. How they could do this successfully for so many years is a matter of opinion, but it is certain that they have been closely watched during the last two years by Commissioner Osborne.

During 1914 and 1915 the total revenues amounted to $3,041,000, while in the 11 years before they amounted to only $9,628,665. This shows that more than 24 per cent of the total collection of oleomargarine taxes from 1902 to 1915 was received during the last few years. Of the $27,000,000 due the government, only $4,650,000 was within the assessable period of two years fixed by the statutes, the remaining taxes all unassessable and recoverable only by suit. All the stamp taxes during these two years have been assessed and since last June a total of $751,000 has been collected. Besides these recoveries numerous violations of oleomargarine and butter laws involving special and stamp taxes were discovered and collections amounting to $100,000 have been made on these. This brings the total of collections, thus far made, up to $851,000. The recoveries represent the results of seizures of plants, assessments of evaded taxes and negotiations between the commissioner and the defendants to settle their civil liability.

Of the more flagrant violations are the following: One manufacturer was assessed $32,000 special and stamp taxes on account of the manufacture and sale of oleomargarine colored with tumeric which has already been paid. In this case the manufacturer seemed ignorant of the fact that the oils used contained tumric and was excused from the criminal proceedings. One company, whose president, treasurer and secretary are under indictment on charges of oleomargarine fraud and whose plant was seized, has been assessed $916,523 for evaded taxes. Another concern, whose president, secretary and treasurer likewise had been indicted and whose plant was seized, has been assessed $193,413. In St. Louis 34 persons were convicted, 27 being given prison terms ranging from one month to three years and find a total of $138,000. Another company, whose president and treasurer pleaded guilty and were sentenced to one year and one day in the penitentiary and to pay a fine of $1,000 each, and whose plant was seized, has been assessed $612,391. It is believed that from one manufacturer the total collection will ultimately reach $1,500,000.

Many creamerymen share the belief of the government that this investigation has checked the extensive fraudulent practices, and it is the determination of the treasury officials to bring every law breaker to justice. The law was made to protect the public, the farmer, and the honest oleomargarine manufacturer, and the department will do its utmost in carrying out the intentions of the authors. It has always been the belief of creamerymen that corrupt practices were being followed by many of the margarine manufacturers, but this investigation has proven a surprise because of the comprehensive and far-reaching results which have been obtained. It simply goes to prove that any law can be enforced when the officials are so minded.

STRAW AND MANURE

We are just beginning to realize the value of stable manure. While the market gardener has for years depended upon it for success, the general farmer is just beginning to see its value, and to give it a place in his farming scheme. With its more general use is also coming more care in saving it, without a loss of the ingredients.

The liquid portion of manure constitutes an important part of it. It may be of interest to note that over half the nitrogen and nearly half of the potash produced by horses is in the liquid excrement. Over half the nitrogen from cows is found in the liquid while there is five times as much potash in the liquid as in the solid excrement. Liquid manure from the pig contains one-fifth of the nitrogen and one-third of the potash. Sheep liquid manure contains one-half the nitrogent and two-thirds of the potash. In general it may be said that the liquid manure is as valuable as the solids when we think of the total plant food, but when we consider the availability, we find that that found in the liquid is immediately available, while that in the solid becomes so only slowly. While the nutrients in the liquid are easily available they are very easily lost, and that is one of the big problems we run against in conserving the manure while it is accumulating.

How can we best save it? The first thing to do is to see that the floor of the stable is water tight. Quit using dirt floors. Then catch the liquid. This can be best done by use of an absorbent. Fortunately we have at hand a cheap and an efficient absorbent. We want to keep the animals clean and this absorbent is ideal for that purpose also. I refer, of course, to straw. Straw will absorb several times its own weight. In addition to this, it contains valuable fertilizing elements in itself. It contains one-third of the nitrogen, one-fourth of the phosphorus, and three-fourth of the potassium of the wheat crop. With the combination, then, we are returning a considerable amount of fertility to the soil. Certainly there is no profit in burning our straw stacks. That is a practice of fifty years ago, and has no place on the modern farm. It is worth figuring pretty closely whether it is even wise to bale and sell the straw, or sell it to a more progressive neighbor to use as fertilizer on the farm across the road.

Geo. W. Graves,
Idaho Experiment Station.

If the wheat ground is not already in shape it should be put in condition at once. It is a fact know to our best wheat raisers that land plowed in July or first half of August and thoroughly worked down will produce more wheat than land plowed later.

THE MISSOURI FARMER

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct, always inclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

SAVING LABOR

Cutting expenses is one way of increasing profits that should not be overlooked in these days of high priced land and big wages. One way to cut expenses with a part of the corn crop is to let the hogs do the harvesting. Hogging down corn is a practice that is on the increase but is not yet used as generally as its advantages warrant. The Iowa station has found by a number of trials that as good results are produced by hogging down corn as can be obtained by gathering the crop and feeding it out and in addition to the equally good results there are several decided advatages. In the first place the labor of gathering the corn, putting it in the crib and then feeding it out of the crib is all saved by letting the hogs gather the corn and feed themselves. The next important gain is in the distribution of the manure which is evenly spread over the land when the corn is fed off in this way but which is usually allowed to waste where the hogs are fed in a dry lot. On many farms where the manure from the horse barns and cattle sheds is saved with some care, the manure from the hog lots is allowed to go to waste without any effort to save it and if this loss could be saved it would add several million dollars to the income of our farms every year.

The Iowa station finds that the corn is harvested without waste, even more closely than the average husker will gather it. The hogs help to clean up the land of bad weeds and grasses by eating some of them and destroying others. The hogs are healthier feeding in the clean fields than when confined to lots infested with all kinds of swine parasites and the exercise they get in gathering their own corn develops good frames which can be finished off with a few weeks feeding in a close pen.

Instead of feeding costly supplements for corn as we must do when the hogs are in a dry lot we can utilize green crops such as rye, rape, soybeans, etc., planted right with the corn or in nearby fields. Where the field is cleared up early enough it can be fall-plowed and the green stalks when turned under will rot quickly and the land will be in the very finest condition for a crop the next spring. We believe if hog and corn raisers will try this method on a part of the corn crop they will find it a good practice.

THE CROP OUTLOOK

While there has been heavy loss in many places from excessive rains this season and upon individual farmers here and there this loss will be heavy if we take the corn situation as a whole the prospect is better than an average. With reasonably good prices prevailing the farmers will be in a better position to take up needed improvements of the farm than they have been for several years.

The August report of the U. S. Department of Agriculture shows that the average condition of all crops for this year is nearly four per cent better than the average condition for the last ten years. Of the leading crops the report gives corn a condition of nine per cent above the average, wheat eight and a half better, oats nearly twenty-three better and hay six and a half per cent above the average. The only crop of importance showing a production under the ten-year average is cotton, which is put down at seventy-three and eight-tenths of an average crop. Iowa and Missouri are among the few states showing a condition under the average but the loss in Missouri is only about two per cent and when we take into consideration that forage crops and pasturage are so abundant this year that grain feeding can be reduced to a minimum it will place the farmers of this state in a much better position than they have been for several years.

We have been asked for an opinion as to whether farmers should sow a large wheat acreage this fall but that is a matter affected by other things than the amount of this year's crop. While the crop is large this year—the largest we have ever produced in this country—a considerable amount of wheat has been damaged from wet weather and every bushel of wheat not fit to mill can be taken off the total and figured as so much feed. If the European war continues many months their armies must be fed, and it is safe to assume that at least a reasonable demand will be made for all our merchantable wheat. If the war should end soon there is no question but what the demand would be lessened considerably but in that event we do not think wheat would be so low as to be unprofitable where good yields are obtained.

It seems to us that the safe plan for Missouri farmers to follow is to plan to sow about the usual acreage but we do not think it advisable to try to sow the full acreage unless the land can be put in good shape for sowing. With the rank growth of weeds on the stubble fields it will not be safe to try wheat on late plowed fields. Where vegetation can be plowed under by the middle of August it will have ample time to decay by the time wheat should be sown but if plowing is delayed until after September 1 it will be very hard to get a good seed bed. Another matter to consider is that wheat insects have been numerous and the best way to check them is to sow less wheat, so we think it the safest plan to cut down the wheat acreage this year to just what can be put into first-class condition for sowing.

WHEN DOCTOR'S DISAGREE?

The series of articles we are running on "How to Get Rid of Hog Cholera" ought to be carefully read by every swine raiser of Missouri and after reading the papers should be filed away for future reference and use. There is a great deal of discussion on this subject coming from the various experiment stations, the U. S. Department of Agriculture, veterinarians and farmers and there is considerable difference of opinion about the best methods to pursue to get rid of cholera, but we do not hesitate to recommend the plan adopted by Dr. Connaway of the Missouri Experiment Station. This plan for getting rid of hog cholera is along the same line as the plan pursued by the Government officials in stamping out the dreaded foot and mouth disease. It is practically the same plan that is followed by various boards of health in getting rid of contagious diseases among people.

This plan should appeal to farmers because it can be carried out by them at a minimum expense and without danger to neighboring farms. No doubt the reason that this simple method of the use of serum with sanitation has been so bitterly assailed by so many is because there is little chance for some one to work the farmers for a big "rake off" in this plan. On the other hand those who depend on the serum and virus method must keep up the expense indefinitely and as few men know how to use the virus safely it calls for extra verterinary fees which take off a considerable part of the profit in hog feeding.

The most unfortunate thing about this controversy as to the two methods of hog cholera control is that so many farmers, veterinarians and experiment station men have placed themselves in a position where it is impossible for them to render an unprejudiced opinion. Recently we read an article printed in one of the leading live stock papers of the country and written by a professor of Animal Husbandry in one of the leading agricultural colleges and the whole weight of the article was to prove that the serum virus method of hog cholera control was a safe method for breeders to use. But to arrive at this conclusion the writer omitted results of investigation that did not support what he wanted to prove with the excuse that this data was not satisfactory. Why did this professor do that? We have it from unquestioned authority that this professor owns stock in a serum company and as a matter of course is profiting by the largest possible sale of serum. A great many farmers have taken stock in serum plants, a perfectly legitimate investment we admit but a man who has this pecuniary interest in the use and sale of serum is not in a position to give unprejudiced advice about matters that will reduce his own profit. And so it is with a great many practicing veterinarians, the serum companies give them a rebate or commission on all the serum they use and it is to their immediate advantage to use all of it they can get the farmers to pay for. Furthermore, you will find many farm and live stock papers biased in their opinions due to advertisements they carry. Some of the largest serum companies refuse absolutely to use the columns of papers for their advertising whose editors advocate the serum-sanitation methods of hog cholera control. Veterinarians who hold stock in serum companies write articles which go out with their official endorsement but the public is in ignorance of their true motive. In differences of this kind it is well for farmers to study the questions from the point of motive and self-interest as well as from the point of effect and that may help them to arrive at a correct conclusion. The Missouri Farmer is trying to give farmers the best and safest methods to save their hogs.

CHANCE FOR FARMER BOYS

The Missouri Farmer wants to get in touch with an ambitious farmer boy in every community in Missouri. We have a plan by which we will pay your board and all other expenses during the "Farmers' Short Course" at Missouri's great Agricultural College. The first course begins in November and will last for seven weeks. The second course begins in January and also lasts for seven weeks—and you can attend either course you prefer. It will be easy for you to comply with our terms by giving us the use of your spare time during the next 60 days and if you make good it means that we will pay for your board and lodging and the text books you will need during your seven weeks' stay in Columbia.

Surely this is a proposal which will interest every ambitious farmer boy in the state. This is an age when young men must know things before they can expect to do things—and, especially is this true of the farmer who is today the most important citizen in the land. The Country is overcrowded with lawyers, doctors and engineers—but never have the myriad farms of the Nation appealed so strongly to the young farmer who truly understands the great fundamentals of modern Agriculture. To this end, every bright young farmer boy should grasp this opportunity to spend seven weeks at Missouri's famous Agricultural College where he will be taught to analyze soils, crop rotations, the breeding and feeding of live stock and a score of other things which will be of inestimable value to him in the future and which he can put into practice with great profit the moment he returns home. **Every father who has a bright son should urge him to take advantage of this splendid offer because his son will return home with a lot of information which the average farmer who has not received a technical training does not possess!**

How many farmers are there who understand how to analyze their soil? How many understand the rotating of crops which will not only bring forth more profitable yields but improve the land? How many understand the value of balanced rations in feeding live stock? These and other important farm problems will be explained by the greatest soil, crop and live stock experts in the state to the boys who take the "Farmers' Short Course." Again, it will do any boy incalculable good to spend seven weeks in a beautiful and clean community like Columbia where he has a chance to mix and mingle with the 3000 other bright Missouri boys and girls who attend Missouri's great University—and our plan is easy for any boy who is really anxious to make something of himself. If our readers know of some farmer boy to whom this offer would appeal we will thank them to bring this matter to his attention. We would like to pay the board and expenses of 500 farmer boys through the two short courses this winter and those who are interested should get in touch with us at once.

THE MISSOURI FARMER, Columbia, Mo.

BUCKSHOT BY THE PROFESSOR

It's hard to write this kind of stuff and wrestle with a sprained back at the same time.

If we are really so wild to get into the war game, there's a mighty tempting situation beyond the Rio Grande.

The United States is getting four times as much money out of its new crop of guns and cartridges as it is out of its splendid new crop of wheat. Such is life in this glorious twentieth century.

"Teddy" and "William J." haven't had anything to say for two whole weeks. They must be suffering from an attack of hay fever. Well, anyway, it's an "ill wind that blows no good"—and at that I like both of them.

Are you and your children real friends? Do they come to you with their secrets and plans? If you would have them listen to you in the after years now is the time to entwine their heart strings arounds yours. Once they are grown it is forever too late.

I have often wondered why so many farmers would rather see a plug horse race than to look at fine hogs and cattle. Some of these days we will see a county fair that possesses some real value from an Agricultural standpoint—as well as mere, worthless entertainment.

Some day before long the floods and drouths and the mad war will end—and in the serene sunshine of the tomorrow which is to come we will once more be wholesomely busy and quietly happy—for surely these extremes of the elements and this world-wide human madness cannot go on forever.

I used to think Chautauquas were splendid institutions—and they were before they degenerated into a rendezvous for broken down bandits, political freaks and other wrecks, jugglers and sleight of hand performers. Maybe some day it will once more be possible to hear a really fine collection of thinkers on these occasions.

If you didn't read the first chapters of "The Plunderer" in our last issue, do so now—and then read the continuing chapters in this number. It's a powerful,fascinating story which would cost you $1.50 at any news stand in the Country. During the next two or three months it will afford you hours of pleasing diversion and relaxation.

As I have said before, I am entirely willing that the United States should prepare itself for defnese in the future but I am not agreeable to the idea that we should convert the Republic into a permanent war camp. Off here to ourselves, we have no quarrels with the great world powers which will come out of the present conflict so exhausted in men and money that they will not be in position to fight again for years to come. The battles we Americans need to fight are upon our farms, in our factories and in the school room. Here lies the true path of our future destiny.

While here and there the excessive rains have done much damage, yet everything considered the farmers of Missouri are in much better condition than they were during 1913 and 1914. After all, we have raised a good average wheat crop and a splendid oat crop. Hay and grass have not been as good in many years and this means an abundance of feed for live stock—while a corn crop which will crowd 200,000,000 million bushels mighty close in on the way. So, altogether, money matters with the average farmer should be fairly easy this fall—and when we think of the peace which obtains in our blessed land as against the red strife which prevails in Europe we should be profoundly thankful.

I wonder how many of you farmers who have been reading this paper for the last year or two really appreciate it and realize what it is striving to do for you? For years Missouri has been without a great farm paper of its own and you farmers have been depending on publications owned and edited in other states which often advocate ideas not suited to Missouri conditions. Two years ago when the Single Tax threatened the farmers of this state it was The Missouri Farmer that first sounded the alarm and most of the literature which exposed that vicious propaganda was written in The Missouri Farmer office. Since then it has plead early and late for an Agricultural Credit System and it did more to pave the way for the Land Bank Bill in the last Legislature than all other publications in the state combined—a measure which, if enacted into law, will give the farmers of this state money at less than 5% interest with 25 years time in which to repay loans. Isn't this kind of service and loyalty entitled to your good will and support? Wouldn't it be doing the "square thing" to send the editor a dollar and ask him to mark you up for three years? Isn't such a paper worthy of your help to the extent of 33⅓ cents per year for three years? It is fighting your battles not only by trying to give you the best information on all kinds of farm problems, but it is trying to help you get a "square deal" in those economic matters upon which the welfare of you and your children depends in the years to come. So why not send in a dollar for which you will get value received ten times over and do your share in building up a great Missouri farm paper which will be a really powerful help to you in the future and a pride to the state?

MADE GOOD ON $20 A MONTH

Many a young man has left the farm because $20 a month looked too small to him to ever get a start. But after a few months in the city on a wage of $60 or $80 a month he finds he has less money at the end of the year than the farm hand has saved. Here is a story from the Dallas News that teaches a moral every young man in the country should not forget:

"Several years ago I read in a Clarksville paper a story concerning two young men of the same age and equal ability who started out from the same neighborhood to make their way in life. Jim sought the country, hired himself to a farmer at $20 a month and at the end of the year he took an inventory of his effects, to-wit: One large floppy straw hat, two suits of overalls, a rugged constitution and $200 in cash. Bob, the other youth, went to a small city and connected with a job paying $65 a month, and at the year's end he also took an inventory, finding these accumulations, to-wit: One suit of ice cream clothes, one imitation Panama hat, four pairs of near silk socks, an appetite for beer and $90 in unpaid bills.

"Have you," asks the Paris reader, "any later information concerning these young men?" To which inquiry State Press begs to say that he has kept in close touch with each of them and today he will make an exhibit of their present standing. Jim duplicated the second year the first year's performance, coming out with $200 cash, making a total of $400. He bought a pair of feminine plow horses, a second-hand wagon, a cultivator and a weeding hoe for half his capital, rented forty acres of land, raised 600 bushels of corn, nine bales of cotton, a mustache and a mule colt. Next year he did about as well and at the end of four years he found himself possessed of $800 in real money, three milch cows, two mule colts, a sow with seven pigs, a set of chin whiskers and 500 bushels of corn.

Feeling plenty able to support a family in comfort he got married, bought thirty acres of land for $1,500, paying $500 cash. He had a couple of light crops and a set of twins during the next two years and had to hustle to pay interest and extra expenses. But he was no quitter; he knew he was on the right track; he raised plenty of good foodstuffs for his home consumption and bought no feed for his live stock. Seven more years have passed and at this writing Jim has three children, one wife, ten head of valuable work animals, a small herd of good cows, a dozen fat shoats, a barn full of corn and hay, 150 acres of land, a white farmhouse with vines growing over the porch, a motor car, a phonograph, $400 in bank and a gorgeous, sunburned complexion. Jim, in short, is rich and happy and a conscious success.

Bob, who chose the town for his operations, also makes an interesting showing at this date. Bob has a wife and a 12-year-old son, the latter being a swell guy who knows the records of all the pugilists and billiard experts and is so smart he calls country folks "rubes." He lives with his parents in a hot little "apartment" close to the business center, thus saving carfare at the expense of eating dust. His father, Bob, is also a wonderfully bright man, who works when he can get a job. He mostly earns about $80 a month, keeps the icebox at home full of beer, when he has the price, and hates his landlord. He is now 35 years old, owes all he can, is a conscious failure and envious of all those who have acquired competencies by saving their wages and not trying to deadbeat their way through the world. This, reader, is how Jim and Bob stand today.

TO FEED SPRING LAMBS

I have 100 acres of good stubble pasture, and I wish to try about 300 head of spring lambs on this for about 4 weeks, and then let them run on 20 acres of peas, for 2 weeks more, and then ship them to the market. Do you think it would pay me to buy the lambs and is there very much risk in western lambs. I have the pasture. Any information you can give me will be appreciated. Yours very truly,

A. J. Martin, M. D.,
Mississippi County.

I am in doubt as to whether it would pay you to buy lambs to run on stubble pasture. The plans that we have been following have always included some crop with a relatively high feeding value such as cowpeas, soybeans and rape. I know that your twenty acres of peas would furnish good pasture. Of course it would not fatten three hundred head of lambs but you should be able to fatten a deck, about one hundred and twenty-five Western lambs, on it if there is a good growth. You do not say whether the peas are in the corn or not. If they are by themselves the waste in pasturing is much greater than where the peas are in the corn and the lambs graze them out of the corn.

There is relatively little risk in feeding Western lambs when you have the proper kind and amount of feed. A trouble called big-head has some times attacked the sheep and has proven quite disastrous, but it is not a common trouble at all.

D. H. Doane,
State Leader County Agent Work,
U. S. Department of Agriculture.

Miss Elsa Gurthet of Pattonsburg, Mo.

Miss Gurthet is another young lady who has recently won our free round trip Railroad and Pullman ticket to the great Panama Exposition. In telling about it in a recent letter she said: "Surely the young women in the thousands of farm homes in which The Missouri Farmer is a visitor don't know about this fine offer of yours or it seems to me you would be having to hire special trains to accommodate them. I didn't find it difficult at all to get the necessary subscriptions for the paper because wherever The Missouri Farmer is known it is liked better than any other farm paper. It is clean and reliable and it is our **home** paper—and any bright girl who is willing to do a little hustling can easily win this great free trip. I am anxious to leave with the first bunch of girls that are ready to go and I am expecting to have a great time seeing the West and the wonderful Exposition."

Beware of Patent Cholera Remedies.

"Hog owners should be very careful about investing in any of the so-called hog cholera cures and preventives, especially the ones that are peddled around in communities where cholera is prevalent," says H. P. Hoskins, Assistant Veterinarian, University Farm, St. Paul. "The very fact that the men who sell these remedies go from farm to farm, on some of which cholera may exist, should be sufficient warning to the farmer who wishes to keep his herd from becoming infected. Quite a number of these remedies have been examined or tested by the Experiment Station in this and other states, and practically all have been found to be of little value in either preventing or curing hog cholera.

Try This Kramer Rotary Harrow 10 Days At Our Risk

LIGHT DRAFT — NO MONEY DOWN — FREIGHT PAID

Harrow and plow at the same time. The Kramer Rotary Harrow can be attached to any sulky gang or steam plow. Pulverizes and levels the ground in one operation. Preserves the moisture in the earth. Produces better crops. Adaptable to any soil. Adjustable to any depth. No extra horses needed.

LIGHT DRAFT

Saves Time—Saves Money

Pays for itself in increased crops and labor and horses saved. Write at once for our Free Illustrated Folder and liberal Freight Paid 10 Day Free Trial Offer. You take no risk. Satisfaction guaranteed. Don't delay. Write today for Free Trial.

EAST ST. LOUIS WALNUT CO.

Dept. 12, East St. Louis, Ill.

Butler Metal GRAIN BIN

CORRUGATED RAT-PROOF FIRE-PROOF

Safe, profitable place to store grain until favorable time to sell. Keeps grain perfectly. Large door, removable shoveling board, 2-foot sliding door for easy scooping. Ask for booklet showing letters from satisfied users.

BUTLER MANUFACTURING CO.
7316 Grand Ave., Kansas City, Mo.

Boston Garter Velvet Grip FOR MEN

GEORGE FROST CO. BOSTON, U.S.A.

Sample Pair Silk 50¢ Lisle 25¢

SEPARATORS, ENGINES, SPREADERS

200,000 customers testify that my designers and factories build quality into them. Built for long, hard, continuous users' satisfaction. HIGHEST QUALITY—LOWEST PRICES. About 1-3 to 1-2 less than you usually pay. Don't buy till you get my catalog of these and other farm and household goods free. A postal gets it. Low freight rates.

D-20 WM GALLOWAY CO., BOX A WATERLOO, IA.

ALFALFA SEED

Choice recleaned alfalfa seed of my own raising, grown without irrigation, $9 per bushel F. O. B. Piedmont. S. E. Morey, Piedmont, Okla.

FREE LAND—Another distribution of choice land, part of Demonstration Plantation, the SHOW plantation of the South, FREE to people having it improved within five years. Need never live on the land. Address Commissioner H. L. Holmes, Block 189, Calvert, Alabama, for particulars.

FARM FOR SALE—500 acres, 200 acres rich bottom land in cultivation, 300 acres grazing land, one mile from county seat. Good churches and good school. One of the best stock farms in Missouri. Address P. O. Box 274, Jackson, Mo.

FOR SALE—S. C. White Leghorn Cockerels, Yesterlaid strain; also others; April hatches; choice lot; prices on application. Mrs. Ray Streeter, Sturgeon, Mo. Rfd. 3.

The Plunderer

By ROY NORTON

Author of "The Garden of Fate"

CHAPTER III

AN UGLY WATCHMAN

By easy stages indicating competent engineering and a lavish expenditure of money, the road led them downward to a barricade of logs, in an opening of which swung a gate barely wide enough to pass the tired burros and their packs.

"You'll find Presby over there," said their unwilling guide, pointing at a group of red-painted mining structures nestled in a flat lap in the ragged mountains.

They surmised that this must be the Rattler camp, and inspected its display of tall smokestacks, high hoists, skeleton tramways, and bleak dumps. Before they could make any reply, the gate behind them slammed shut with a vicious bang that attracted their attention. They turned to see the watchman hurrying back up the road. Fixed to the barricade was a sign, crudely lettered, but insistently distinct:

No one allowed on these premises, by order of the owners. For any business to be transacted with the Croix d'Or, apply to Thomas W. Presby.

"Curt enough, at least, isn't he?" commented Townsend, half-smiling.

"Curt!" growled his companion, frowning, with his recent anger but half-dissipated. "Curt as a bulldog takin' a bite out of your leg. Don't waste no time at all on words. Just says: "It's you I'm lookin' after.' Where do you reckon we'll find this here Thomas Presby person?"

"I suppose he must have an office up there somewhere," answered Townsend, waving his arm in the direction of the scattered buildings spread in that profligacy of space which comes where space is free.

"These mules is tired. It's a shame we couldn't have left them up there," Matthews answered, looking at them and fondling the ears of the nearest one. "You go on up and get an order letting us into your mine, and I'll wait here. No use in makin' these poor devils do any more'n they have to."

Townsend assented, and followed a path which zigzagged around bowlders and stumps up to the red cluster on the hillside above him. He was impatient and annoyed at the useless delays imposed upon them in their new venture, and wondered why his father's partner had not informed him of the fact that he would find the mine guarded by the owner of the adjoining property.

A camp "washwoman," with clothespins in her mouth, and a soggy gray shirt in her hands, paused to stare at him from beneath a row of other gray and blue shirts and coarse underwear, dripping from the lines above her head.

Two little boys, fantastically garbed in faded blue denim which had evidently been refashioned from cast-off wearing apparel of their sires, followed after him, hat in hand, as if the advent of a stranger on the Rattler grounds was an event of interest, and he found himself facing a squat, red white-bordered, one-storied building, over whose door a white-and-black sign told the stranger, or applicant for work, that he was at the "office."

A man came to a window in a picketed wicket as he entered, and said briskly: "Well?"

"I want to see Mr. Presby," Dick answered, wasting no more words than had the other.

"Oh, well, if nobody else will do, go in through that door."

Before he had finished his speech, the bookkeeper had turned again toward the ledger spread out on an unpainted, standing desk against the wall behind his palings, and Dick walked to the only door in sight. He opened it, and stepped inside. A white-headed, scowling man, clean shaven, and with close-shut, thin, hard lips, looked up over a pile of letters and accounts laid before him on a cheap, flat-topped desk.

Dick's eyes opened a trifle wider. He was looking at the man who had defied the mob at the road house ,and at this close range studied his appearance more keenly.

There was hard, insolent mastery in his every line. His face had the sternness of granite. His hands, poised when interrupted in their task, were firm and wrinkled as if by years of reaching, and his heavy body, short neck, and muscle-bent shoulders, all suggested the man who had relentlessly fought his way to whatever position of dominancy he might then occupy. He wore the same faded black hat planted squarely on his head, and was in his shirt-sleeves. The only sign of self-indulgence betrayed in him or his surroundings was an old crucible, serving as an ash tray, which was half-filled with cigar stumps, and Dick observed, in that instant's swift appraisement, that even these were chewed as if between the teeth of a mentally restless man.

"You want to see me?" the man questioned, and then, as if the thin partition had not muffled the words of the outer office, went on: "You asked for Presby. I'm Presby. What do you want?"

For an instant, self-reliant and cool as he was, Dick was confused by the directness of his greeting.

"I should like to have you tell that watchman over at the Croix d'Or that we are to be admitted there," he replied, forgetting that he had not introduced himself.

"You should, eh? And who are you, may I ask?" came the dry, satirical response.

Dick flushed a trifle, feeling that he had begun lamely in this reception and request.

"I am Richard Townsend," he answered, recovering himself. "A son of Charles Townsend, and a half-owner in the property. I've come to look the Croix d'Or over."

He was not conscious of it then, but remembered afterward, that Presby was momentarily startled by the announcement. The man's eyes seemed intent on penetrating and appraising him, as he stood there without a seat having been proffered, or any courtesy shown. Then, as if thinking, Presby stared at the inkwell before him, and frowned.

"How am I to know that?" he asked. "The Cross has had enough men wanting to look it over to make an army. Maybe you're one of them. Got any letters telling me that I'm to turn it over to you?

For an instant Dick was staggered by this obstacle.

"No," he said reluctantly, "I have not; that is, nothing directed to you. I did not know that you were in charge of the property."

He was surprised to notice that Presby's heavy brows adjusted themselves to a scowl. He wondered why the mine owner should be antagonistic to him, when there was nothing at stake.

"Well, I am," asserted Presby. "I hired the watchman up there ,and I see to it that all the stuff lying around loose isn't stolen."

"On whose authority, may I ask?" questioned Dick, without thought of giving offense, but rather as a means of explaining his position.

"Sloan's. Why, you don't think I'm watching it because I want it, do you, young man? The old watchman threw up his job. I had Sloan's address, and wrote him about it. Sloan wrote and asked me to get a man to look after it, and I did. Now, you show me that you've got a right to go on the grounds of the Cross Mine, and I'll give an order to the watchman."

There was absolute antagonism in his tone, although not in his words. Dick thought of nothing at the moment but that he had one sole proof of his ownership, the letter from Sloan himself. He unbuttoned the flap of his shirt pocket, and, taking out a bundle of letters, selected the one bearing on the situation.

"That should be sufficient," he said, throwing it, opened, before Presby.

The latter, without moving his solid body in the least, and as if his arms and hands were entirely independent of it, stolidly picked up the letter and read it. Dick could infer nothing of its reception. He could not tell whether Presby was inclined to accept it as sufficient authority, or to question it. Outside were the sounds of the Rattler's activity and production, the heavy, thunderous roar of the stamp mill, the clash of cars of ore dumped into the maws of the grizzly to be hammered into smaller fragments in their journey to the crusher, and thence downward to end their journeys over the thumping stamps, and out, disintegrated, across the wet and shaking tables.

It seemed, as he stood waiting, that the dust of the pulverized mountain had settled over everything in the office save the granite-like figure that sat at the desk, rereading the letter which had changed all his life. For the first time he thought that perhaps he should not have so easily displayed that link with his past. It seemed a useless sacrilege. If the mine-owner was not reading the letter, he was pondering, unmoved, over a course of action, and took his time.

Dick thought bitterly, in a flash, of all that it represented. The quarrel with his father on that day he had returned from Columbia University with a mining course proudly finished, when each, stubborn by nature, had insisted that his plan was the better; of his rebellious refusal to enter the brokerage office in Wall Street, and declaration that he intended to go into the far West and follow his profession, and of the stern old man's dismissal when he asserted, with heat:

"You've always taken the road you wanted to go since your mother died. I objected to your taking up mining engineering, but you went ahead in spite of me. I tried to get you to take an interest in the business that has been my life work, but you scorned it. You wouldn't be a broker, or a banker. You had to be a mining engineer! All right, you've had your way, so far. Now, you can keep on in the way you have selected. I'll give you five thousand dollars, but you'll never get another cent from me until you've learned what a fool you're making of yourself, and return to do what I want you to do. It won't be long! There's a vast difference between dawdling around a university learning something that is going to be useless while your father pays the bills, and turning that foolish education into dollars to stave off an empty belly. You can go now."

In those days the house of Phillip Townsend had been a great name in New York. Now this was all that was left of it. Dissolution, death, and dust, and a half-interest in an abandoned mine! The harsh voice of Bully Presby aroused him from his thoughts.

"All right," he said. "This seems sufficient, but if you've got the sense and judgment Sloan seems to think you have, you'll come to the conclusion that there's not much use in wasting any of his good, hard dollars on the Croix d'Or. It never has paid. It never will pay. I offered to buy it once, but I wouldn't give a dollar for it now, beyond what the timber above ground is worth. It owns a full section of timberland, and that's about all."

He reached for a pen and wrote a note to the watchman, telling him that the bearer, Richard Townsend, had come to look over the property and that his orders must be accepted, and signed it with his hard-driven scrawl. He handed it up to Dick without rising from his seat, and said: "That'll fix you up, I think."

As if by an afterthought, he asked: "Have you any idea of the condition of the mine?"

"No," Dick answered, as he folded the letter and put it into his pocket, together with the one from his late father's partner.

"Well, then, I can tell you, it's bad," said Presby, fixing him with his cool, hard stare. "The Cross is spotted. Once in a while they had pay chutes. They never had a true ledge. There isn't one there, as far as anybody that ever worked it knows. They wasted five hundred thousand dollars trying to find it, and drove ten thousand feet of drifts and tunnels. They went down more than six hundred feet. She's under water, no one knows how deep. It might take twenty thousand to unwater the sinking shaft again, and at the bottom you'd find nothing. Take my advice. et it alone. Good-day."

Dick walked out, scarcely knowing whether to feel grateful for the churlish advice or to resume his wonted attitude of self-reliance and hold himself unprejudiced by Presby's condemnation of the Croix d'Or. He wondered if Bully Presby suspected him of having been friendly with the mob of drunken ruffians at the road house, but he had been given no chance to explain.

At the bottom of the gulch he found Bill sprawled at length on his elbows almost under the forefeet of one of the burros which was nosing him over in a friendly caress. He called out as he appproached, and the big prospector sat up, deftly snapped the cigarette he had been smoking into the creek with his thumb and forefinger, and got to his feet.

"Do we get permission to go on the claim?" he grinned, as Townsend reached him.

"Yes, I've got an order to the watchman. The old man doesn't seem to think much of it. Says it's spotted. Had rich pay chutes, but they pinched. No regular formation. Always been a loser. Thinks we'd be foolish to do anything with it."

"Good of him, wasn't it?"

Dick looked quickly at the hard, lined face of his companion.

"That's the first thing I've heard that made me feel better," declared the prospector, as he swung one of the burro's heads back into the trail and hit the beast a friendly slap on the haunches to start it forward. "Whenever a man, like this old feller seems to be, gives me that kind of advice, I sit up and take notice."

"Why—why, what do you know about him?" Dick asked, falling into the trail behind the pack animals, which had started forward with their slow jog trot, and ears swaying backward and forward as they went.

"While you was gone," Matthews answered, "I had a long talk with a boy that came along and got friendly. You can believe boys, most of 'em. They know a heap more than men. They think out things that men don't. Kids are always friends with me; you know that. I reckon, from what I gathered, that this Presby man is about as hard and grasping an old cuss as ever worked the last ounce of gold out of a waste dump. He makes the men save the fags of the candles and the drips, so's he can melt 'em over again. He runs a company store, and if they don't buy boots and grub from him, they have to tear out mighty quick. He fired a fireman because the safety-valve in the boiler-house let go one day twenty minutes before the noon shift went back to work. "If he says, 'Let the Cross alone,' I think it's because he wants it."

"You couldn't guess who he is," Dick said, preparing to move.

"Why? Do I know him?"

"In a way. He's the man we saw the mob tackle, back there at the road house."

Bill gave a long whistle.

"So that's the chap, eh? Bully Presby! Well, if we ever run foul of him, we've got our work cut out for us. Things are beginnin' to get interestin'. 'I like the place,' as Daniel said when he went to sleep in the lion's den."

They opened the gate through the barricade without any formality, and were well started up the inclined road of the Croix d'Or before they encountered the watchman who had given them so much trouble. As he came toward them, frowning, they observed that he had buckled a pistol round him as if to resist any intrusion in case it should be attempted without instructions. Dick handed him Presby's order, and the man read it through in surly silence; then his entire attitude underwent a swift change. He became almost obsequiously respectful.

"I'll have to go down and have a talk with Mr. Presby," he said, and would have ventured a further remark, but was cut short by the mine-owner.

"Yes, you'd better go and see him," Dick said concisely. "And when you go, take all of your dunnage you can carry, then come back and get the

rest. I shall not want you on the claim an hour longer than necessary for you to get your stuff away. You're too good a man to have around here."

The fellow gave a shrug of his shoulders, an evil grin, and turned back up the road to vanish in what had evidently been the superintendent's cabin, and noisily began to whistle as he gathered his stuff together. The partners halted before the door, and Dick looked inside.

"I suppose you have the keys for everything, haven't you?" he called.

The man impudently tossed a bundle at him without a word. Apparently his belongings were but few, which led the newcomers to believe that he had taken his meals at the Rattler, and perhaps slept there on many nights. They watched him as he rolled his blankets, and prepared to start down the trail.

"The rest of that plunder in there, the pots and the lamp, belong to the mine," he said. And then, without other words, turned away.

"That may be the last of him, and maybe it won't!" growled Bill, as he began throwing the hitches off the tired burros that stood panting outside the door. "Anyway, it's the fag end of him tonight."

They were amazed at the lavish expenditure of money that had been made in the superintendent's quarters. There were a porcelain bath tub brought up into the heart of the wilderness, a mahogany desk whose edges had been burned by careless smokers, and a safe whose door swung open, exposing a litter of papers, mine drawings, and plans. The four rooms evidently included office and living quarters, and they betokened a reckless financial outlay for the purpose.

"Poor Dad!" said Dick, looking around him. "No wonder the Cross lost money if this is a sample of the way the management spent it."

He stepped outside to where the canon was beginning to sink into the dusk. The early moon, still behind the silhouette of the eastern fringe of peaks and forests, lighted up the yellow cross mark high above, and for some reason, in the stillness of the evening, he accepted it as a sign of promise.

CHAPTER IV

THE BLACK DEATH

It took seven days of exploration to reveal the condition of the Cross of Gold, and each night the task appeared more hopeless. The steel pipe line, leading down for three miles of sinuous, black length, from a reservoir high up in the hills, had been broken here and there maliciously by some one who had traversed its length and with a heavy pick driven holes into it that inflicted thousands of dollars of expense.

The Pelton wheels in the power house, neglected, were rusted in their bearings, and without them and the pipe line there could be no electric power on which the mill depended. The mill had been stripped of all smaller stuff, and its dynamos had been chipped with an ax until the copper windings showed frayed and useless. The shoes of the huge stamps were worn down to a thin, uneven rim, battering on broken surfaces. The Venners rattled on their foundations, and the plates had been scarred as if by a chisel in the hands of a maniac.

The blacksmith's tunnel—the tunnel leading off from the level—was blocked by fallen timbers where a belt of lime formation cut across; and fragments of wood, splintered into tooth-pick size, had been thrown out when the mountain settled to its place. But a short distance from the main shaft, which was a double compartment, carrying two cages up and down, in every level the air was foul down to the five-hundred foot level and below that the mine was filled with water.

Patiently Dick and the veteran explored these windings as fast as they might until the sputtering of their candles warned them that the air was loaded with poison, and often they retreated none too soon to scale the slippery, yielding rungs of the ladder with dizzy heads. Expert and experienced, they were puzzled by what was disclosed. Either the mine had yielded exceedingly rich streaks and had been, in mining parlance, "gophered," or else the management had been as foolish as ever handled a property.

In the assay-house, where the furnaces were dust-covered, the scale case black with grime, and the floor littered with refuse crucibles, cupels, mufflers, and worn buckboards, they discovered a bundle of old tablets. Almost invariably these showed that the assays had been made from samples that would have paid to work, but this alone gave them no hope.

But this was not all. A mysterious enmity seemed to pursue all their efforts. Yet its displays were unaccountable for by natural causes. On their arrival at the mine they found water, fresh and clear, piped into every cabin, the mess-house, and the superintendent's quarters. They traced it back and discovered a small lake formed and fed by a large spring on what was evidently land of the mine. It suddenly failed them, and proved unwholesome. An investigation of the tiny reservoir disclosed masses of poisonous weeds in the water. They decided that they must have been blown there after their arrival, cleared the supply and yet, but two days later, when there had been no wind of more than noticeable violence, the weeds were there again. They abandoned their water supply for the time being and resorted to the stream at the bottom of the canon.

A day later one of their burros died mysteriously, and Bill, puzzled, said he believed that it had lost its sense of smell and eaten something poisonous. On the day following the other died, apparently from the same complaint. The veteran miner grieved over them as for friends.

"I've been acquainted with a good many of 'em," he said, sorrowfully, "but I never knew two that had finer characters than these two did. They were regular burros! No cheaters—just the square, open and above-board kind, that never kicked without layin' back their ears to give you warnin' and never laid down on the trail unless they wanted to rest. The meanest thing a burro or a man can do is to die voluntarily when you're depending' on him, or when he owes you work or money. So it does seem as if I must have been mistaken in these two, after all, because we may need 'em."

Dick did not smile at his homily, for he caught the significance of it, that the Croix d'Or would have to make a better showing than they had so far discovered to warrant them in opening it. They had come almost to the end of the investigations possible. They scanned plans and scales in the office to familiarize themselves with the property, and there was but one portion of it they had not visited. That was a shaft which had been the "discovery hole," where the first find of ore had been made. And it was this they entered on the day when Fate seemed most particularly unkind. Yet even Fate appeared to relent, in the end, through one of those trifling afterthoughts which lead men to do the insignificant act. They had prepared everything for the venture. They had an extra supply of candles, chalk for making a course mark, sample bags for such pieces of ore as might interest them, and the prospector's picks and hammers when they started out. They were a hundred yards from the office when the younger man hesitated, stopped and turned back.

"I've an idea we might need those old maps," he said. "We haven't gone over them very much and they might come in handy."

Bill protested, but despite this Dick went back to the quarters and got them. They were crude, apparently, compared with the later work when competent engineers had opened the mine in earnest; but doubtless had served their purpose. The men came to the mouth of the old shaft which had been loosely covered over with poles, and around which a thicket of wild blackberry bushes had sprung up in stunted growth. An hour's work disclosed the black opening and a ladder in a fair state of preservation. They lowered a candle into the depths and saw that it burned undimmed, indicating that the air was pure, and then descended cautiously, testing each rung as they went. The shaft was not more than fifty feet deep, and they found themselves standing on the bottom and peering off into a drift which had been crudely timbered and had fallen in here and there as the unworked ground had settled.

"There doesn't seem to be much of anything here except some starved quartz," Bill said, staring at the wall after they had gone in some thirty or forty feet, and they had come to a place where the lagging had dropped away. He caught another piece of the half-rotted timbering and jerked it loose for a better inspection. It gave with a dull crack, then, immediately after, and seeming almost an echo, there was a terrific rumble, and a report like the explosion of a huge gun back in the direction of the shaft. Their candles flickered in the air impact, and for an instant they feared that the roof was coming down on them to crush them out of all resemblance to human beings.

They turned and ran toward the shaft. A few loose pebbles and pieces of rock were dripping from above like a shower of porphyry. For an instant they dared not step out, but stood inside the drift, waiting for what might happen and staring at each other with set faces exposed in the still flicekring light. They had said nothing up to this time, being under too great stress to offer other than sharp exclamations.

"Sounds like that shaft had given way!" the veteran exclaimed. "If it has——"

He leaned forward and looked into Dick's face.

"If it has," the latter took up, "we are in a bad predicament."

They stood tensed and anxious until the pebbles stopped falling and a silence like that of a tomb, so profound as to seem thick and dense, invaded the hollows; then Dick started out into the shaft. He felt a restraining hand on his arm.

"Wait a minute, boy," the elder man said. "You're the owner here. It's dangerous. I ought to be the one to go first and find out what's happened. You wait inside the drift."

But Dick shook his hand off and stepped out to look upward. A dense blackness filled what should have been a space of light. This he had partially expected from the fact that when they came out toward the shaft there had been no sign of day; but he had not anticipated such a complete closing of the opening.

"Lord! We're buried in!" came an exclamation from behind him, and he felt a sudden sinking of the heart.

"I'll go easily till I came to it," he said, his voice sounding strained and loud although he had spoken scarcely above a whisper. "You stand clear so that if anything gives, Bill, you won't be caught."

The elder miner would have protested, but already he was slowly and cautionsly climbing the ladder. Step by step he ascended, holding the light above his head to discover the place where the shaft had given way, and then Bill, standing anxiously below, heard a harsh shout.

"I think the ladder will bear your weight as well as mine. Come up here."

The big man climbed steadily upward until he stood directly beneath the younger man's feet. He ventured an exclamation that was almost an oath.

"Not the shaft at all," he said, an instant later. "It's just a bowlder so big that it has filled the whole opening. We're plugged and penned in here like rats in a trap!"

Dick took his little prospecting hammer and tapped the bowlder, at first gently ,then with firmer strokes, and looked down at his partner with a distressed face.

"Hear that?" he exclaimed, rather than questioned. "It's a big one, and solid. It sounds bad to me."

For a minute they waved their candles round the edge, inspecting the resting place of the rock that had imprisoned them. Everywhere it was set firmly. A fitted door could have been no more secure. They consulted, and at last Bill descended and stepped back into the entrance to the drift to avoid falling stone, while the younger man attacked the edge beneath the bowlder, inch by inch, trying to find some place where he could pick through to daylight. At last, his arm wearied and the point of his prospecting hammer dulled, he rested.

"Come down, Dick, and I'll take a spell," Bill called up from below, and he obeyed.

The big miner, without comment, climbed up, and again the vault-like space was filled with the persistent picking of steel on stone. For a half-hour it continued, and then, slowly, Bill descended. He sat down at the foot of the shaft, wiped the sweat from his face, thrust his candle-stick in a crevice and rolled a cigarette before he said anything, and then only as Dick started to the foot of the ladder.

"It's no use," he said. "We're holed up all right. I picked clear around the lower edge and there isn't a place where she isn't resting on solid rock. Nothing but dynamite could ever move that stone. Unless we can find some other way out we're——"

He paused and Dick added the finishing word, "Gone!"

"Exactly! No one knows we're here. No one comes to the mine. We're in the old works which I don't suppose a man has been inside of in five or ten years, and the map shows that it doesn't connect with the other ones. Answer—the finish!"

Dick pulled the worn and badly drawn plans from his pocket and then lighted his own candle, indulging in the extravagance of two that he might study the faint and smudged penciled lines.

"Here, Bill," he said, pointing at the drawing. "These two side drifts each end in what are now sump holes. We've got to watch out for them. That makes it safe for us to take the main drift and see where it leads. The two end drifts evidently ran but a few feet and were then abandoned. So, if these plans are any good, they, too, are safe, if we can get into them."

The elder miner peered at the plans and studied them. He stood up and blew out his candle. He thrust his hands into his pockets.

"I've got three candles left," he said, "and I can't just exactly say why I put that many in unless the Lord gave me a hunch we'd need 'em. How many you got!"

"One in my pocket, and this."

"Then we'd better move fast, eh?"

Mrs. J. E. Roberts, Maysville.

THE FARM HOME BEAUTIFUL

Mrs. Belle Van Dorn Harbert, President of the International Congress of Farm Women, Manzanola, Colorado.

[Mrs. Harbert has had all the experiences of a farm woman on a far Western home and in her travels abroad she spent many weeks among the humble Belgians, staying in their thrifty homes and studying their daily lives as compared with the life of the average farm woman in America; these same homes have been made desolate by the fearful ravages of war.—A. K.]

Go where you may and you will find a large percentage of the farm mothers and daughters dissatisfied—not because they are overworked or mistreated—but just simply because they are lonesome, and their souls hunger for more beautiful surroundings, and for love and companionship, for the happiness that comes from fellowship, for recognition in society and for more modern conveniences in the farm home.

Supply these and all is changed, their shoulders straighten, their eyes brighten, and the corners of their mouths turn up, mother's step becomes more elastic, she sings the songs of yesterday, and her work is glorified before her eyes. The daughters, too, instead of planning a life behind some counter in the city, or at the typewriter, sees the happiness in the open fields and the pure free air of the country.

These things do not depend upon wealth as counted in dollars and cents, for wealth does not consist of the things which we possess, but the things which we enjoy. The poorest home in the world is one with money and nothing else.

Is it not time then, that we "Consider the lilies of the field?" and think of what God has done to make the earth man's dwelling place and how the little things in nature have been worked out with such infinite pains? How each little flower, like each little thought, invariably produces its own kind and how discontent and dissatisfaction are born and nurtured around the unkempt and inconvenient dwelling place?

We have spent too much thought in making a living and too little on living. I know the cornfield has a substantial look because its products pay for the farm but the flower garden has a refining look that makes the farm worth paying for.

There is a Divine relationship between humanity and beauty that cannot be explained until we know why the rose is sweet and the dewdrop pure or the prismic colors of the rainbow pleasing to our senses. We can not tell why we go into ecstasy over the color of a Colorado sunset or the majesty of the mountain peak but we do know that they who miss the joy and exultation over the manifest beauty of nature are poor indeed. Behold the beauty of the landscape, every part of which is necessary to effect a perfect whole; the white clouds floating in the clear blue sky, the haze, the mist, the black and threatening clouds that furnish a magnificent background for the rainbow—all are phenomena of beauty necessary to develop the highest type of animate life which is man. If we do not take them into account and profit by their lessons we miss the refinement and the perfect development they bring, and the process of evolution and unfoldment stops so far as we are concerned until we do catch their meaning and make it a part of our ideal selves.

If we surround ourselves and our families with beauty, pure and unadulterated, if we learn to love it, live it, then our brains by some secret process which man has not yet discovered, links our material bodies to the beautiful and it manifests itself in the very warp and woof of our animate existence. If God has taken such infinite pains to beautify by His handiwork, is it not worth while for us to consider its worth and to cultivate it in our personality, in our surroundings, in our very souls?

Will we let the gilded saloons, the beautiful parks, the gay ballrooms of the city rob us of our boys and girls because they are starved for companionship and love and beauty and modern surroundings in the farm home? No, a thousand times no!

We can make our homes so beautiful, and our surroundings so pleasant and agreeable, and farm life so attractive and restful that we will have the world at our gates begging entrance, because of the peace, contentment, refinement, culture and hospitality of the rural homes.

The reason the call to the farm has not been answered and the march from the farm to the city is increasing to an alarming extent is because the world reads the value we put upon our farm homes by the beauty, comfort and convenience with which we surround them. The forlorn picture of the old farmer and his poor hard-working wife has become fixed upon the minds of the people and will not be changed until we have posed for a new picture and sent in the proof.

NOTES ON CANNING

(Continued from previous issues)

Wind Fall Apples.—By canning the wind fall apples an enormous waste may be eliminated. When they are canned they may be used for salads, dumplings and various other dishes giving the same results as the fresh fruits. To can whole, remove blemishes, cut out core; place in cheese cloth sack and dip in boiling water 5 minutes. Plunge in cold water. Pack in sterile jar and cover with a thin syrup. Place lids on loosely and sterilize in boiler for 45 minutes or until apple appears tender. Apples may be pealed, cored and sliced and canned in the same manner as when canned whole.

Pears.—Pears should be well ripened before they are preserved. Those not ripened may be kept for several weeks if wrapped in tissue paper and stored in a cool dry place; this makes it possible to extend the time of canning and spread the work over a longer time. Pears are one of the standard everywhere, and because of their high food value and other qualities, should appeal to the housewife. The small sugar pears are best for preserves and Bartlett pears for canning.

Wash thoroughly, peel and halve them, remove the cores and drop fruit at once into cold water to prevent discoloration. When the peeling is finished, pack the halves as closely as possible into the jar. Place lid on loosely and place in boiler and steam until tender, which is usually about an hour, with solid fruit. Remove jar, place on sterile rubber, fill to overflowing with boiling syrup and seal.

Note—The syrup may be added before the fruit is steamed.

Quinces.—Quinces may be canned in the same way as pears but the time of cooking in jar must be lengthened until fruit is thoroughly cooked. Quince is a more firm fruit and requires a longer time for cooking.

Canned Grapes.—Pick firm grapes from the bunches. Wash them carefully and pack them as closely as possible in a sterile jar with rubber in place, without crushing. Fill with thin boiling syrup. Place the lid on loosely and steam in boiler until grapes are heated through, which will take from twenty to thirty minutes.

Fruit Juices

The canning of fruit juice in many cases is very profitable. When berries and small fruits are too ripe for successful canning otherwise, the juice may be extracted and preserved by canning and used to great advantage in the preparation of sauces, desserts and beverages. An iced fruit juice makes a delicious and refreshing drink during warm weather.

Grapes.—Grapes are at their best when fully ripened, though for jelly, they should be picked slightly under ripe, and for green grape jelly, pick just as they have begun to turn color. Grapes are widely grown and stand transportation so well that they should form one of the staples in the store of canned goods. Their food value is high among fruit.

Grape Juice.—Use only well ripened grapes. Wash them thoroughly and crush them. Heat the crushed grapes for about five minutes, but do not let them come quite to the boiling point. Then drain through jelly bag without applying pressure. Set juice aside for twenty-four hours. At the end of this time drain the juice from the sediment. Add small amount of sugar and boil the juice twenty minutes to sterilize it; put it in a sterile jar and seal it at once.

Note.—Other fruit juices may be canned in the same manner.

Addie D. Root,
Extension Service Department,
University of Missouri.

Recipe for Canning Corn

Sweet corn should be canned the same day that it is picked. After removing the husks and silk, blanch the corn (before cutting from the cob) in boiling water from 5 to 15 minutes. Blanching is done by placing the corn in a wire basket or cheesecloth and plunging into hot water, or better still by steaming the corn. Blanching will make the texture more firm. Next plunge the corn quickly into cold water. Then cut the corn from the cob and pack tightly in jars until full. Add a level teaspoonful of salt to each quart and sufficient hot water to fill all crevices. Then put on the rubbers and tops and partially tighten the tops. Place the jars in a large wash boiler or kettle containing a false bottom. The water should come over the tops of the jars. Boil three hours. The false bottom may consist of wooden slats or any suitable material which will prevent the jars from coming in direct contact with the heated metal. After boiling, allow the water to cool partially, remove from the bath, tighten the lids, and invert to cool. If the wash boiler method is not used, boil 90 minutes in a water-seal oufit, 60 minutes under five pounds of steam or 35 minutes under 20 pounds of steam.—Department of Home Economics, University of Nebraska.

BETTER SCHOOLS FOR FARM BOYS AND GIRLS

Is it fair to compel our boys and girls of the farm to attend a school taught by an inferior teacher, provided with poor equipment when we know that in a few years these same boys and girls will be meeting in a business and social way men and women whose educational training was obtained in the best schools money could provide? But this is exactly what we are doing in most of our country districts. We are doing this because we think it is the best we can do under the circumstances. But if one district can do better why can not others do better? If one state can do better why can not we, under about the same conditions, do better?

The state of Indiana is very similar to Missouri in her natural resources. It is in the same latitude and inhabited by about the same kind of people, but there is a difference in the schools. Last year forty per cent of the boys and girls of Indiana attended consolidated schools. In a recent address before the American Bankers' Convention, Professor G. I. Christie of the Indiana Agricultural College, discussed the consolidated school in a very able manner and we reproduce here an abstract of the address:

"Down in the city of New York we can go into the slum districts and find the Poles and Hunyacks, and all the other varieties that have simply been imported to this country. We don't have any hope of them taking charge of this government anywhere in the near future. We find schools there costing $100,000, $200,000, $300,000, with all the fine equipment that money can buy, with teachers at the highest salaries, with the best training that can be given to educators. We go then out into the great state of Indiana and into this great state of Illinois, into Wisconsin and Michigan and all the other great states, and what do we find? We find boys and girls from the great blooded stock of this country tramping down the muddy road into that little, barren, two by four, four-walled schoolroom that has neither pictures nor paint; no plaster, no shrubs, no books, no laboratories of any kind. They are taught by a girl from 16 to 18 years of age, just coming out of school, with no training, bent down with a multiplicity of duties, and then we find that in that boy and girl the hope of America lies. What is that hope going to be? What do we hope to realize if we are going to send our boys and girls from the farms into such institutions? We are proud as American citizens to say that we are workin for equal advantages for all children, for all people. I want to ask you if it is true in your state that the boy and the girl of the farm in

Watermelon time in Southeast Missouri. Watermelons are shipped from this section by train loads. What other state can show such a diversity of products as Missouri?

that school which they attend six or eight months in the year have equal advantages with the boy and the girl of the cities? On the average I don't believe they have.

The One-Room School Must Go

"Down in Indiana the little one-room school is fast disappearing. Last year 40 per cent of the Indiana farm boys and girls attended the larger consolidated schools. Our people believe in consolidation. In 1910 we had 446 consolidated schools. In 1914 that number had grown to 665, so that last year we took care of 40 per cent of all the farm boys and girls in these larger institutions. Now I want to ask if we have a consolidated school that is built of good material in a good locality, in which we place the agricultural laboratory and the domestic science laboratory, a school that is able to pay a salary of $1200 to $1500 to a high class well-trained teacher of agriculture, to another of domestic science, to another in manual training, and to other teachers of equal ability for the other subjects, all under a superintendent who is well trained under a high class supervisor—I want to ask you if the boys and girls in a school like this don't have advantages that are far above the ones that are given to the boys and girls who are forced to the little one-room school that is unsightly, unsanitary, unequipped and with a teacher untrained and loaded down so she can't give attention and time to the duties and to the teachings that boy and girl should receive? I think you will all agree that notwithstanding the great hip and hurrah that is raised for it, the one-room school in the average community is not meeting the needs of that community, and we need to do something today. We can do something.

Now, what are consolidated schools doing? In the first place they permit of better teachers. The trouble with the schools in the country is this: they are short-termed. We hire teachers to come out from town and to stay in the community from Monday morning at 9 o'clock until 4 o'clock Friday afternoon, and then disappear. They stay in that community from the first of October until the first of April, and then they disappear to some summer resort, or some university, or to get into some other institution. They are gone. If the country schools, if country agriculture, if home life influenced by the schools is to go forward, then the teacher must be a resident of that community and live in that community and work in that community twelve months in the year. Our consolidated schools are providing for this very thing. In Indiana this year the state is joining with the local communities and paying a part of the salary of agricultural teachers, and home economics teachers, and keeping them right in that community from the time school closes in the spring until it opens in the fall. Then under the direction of Purdue and the State Department of Public Instruction, these men and these women are going into the homes. We are not buying land and conducting work down at the school, but we are handling those boys and girls, growing corn and feeding pigs, and raising chickens and baking bread and canning fruit, and doing other work right at home with the mothers and fathers. Instead of telling them how to do it during the winter time, and saying to them: "Go home and do it during the summer, while I go to a summer resort, or go off to the college," that teacher is called upon to visit the different boys and girls at least once every ten days, and spend time enough with them to get notes on their work, so as to know exactly what they are doing. Then that teacher is in a position in the fall to give those boys and girls a grading on their school work for the work they have done in that laboratory in the home on the farm.

One of the great troubles has come in the schools because the teacher hired from town, educated in higher institutions away from the fathers and mothers, has not been in sympathy with the agricultural and the home life of that community. It has worked something like this. A boy six years of age is turned into school where he is going to spend the best days of his life. He comes down there that first morning in September and sits on that high seat they give him. He dangles his feet all morning long until he is tired out. He takes a book and leafs it over and looks at the pictures. He takes his pad and his pencil and he scribbles on it as well as he can. All at once he becomes tired and puts up his hand and says: "Teacher, I want to tell you about that little colt I have got at home," or about the "pet calf, or baby chickens that mother has got." What does teacher say? "No, we don't talk about those things in school. You are down here to learn reading and writing and we don't talk about those other things." The boy is shut up right there. Some time later he gets interested in books and then we find him at home, later on in years. They are gathered around the supper table, and the boy begins to tell father about a spelling match they had in school, and how somebody tripped over a word and had to go down to the foot, or how they had an algebraic problem, and this boy tried it and failed and then that boy, and then the teacher got up to the board and she failed. She went wrong, and, oh, what fun! Then what does father say? "We don't have time for those details. When you fellows come home you don't think about my business at all. Don't you know the calves haven't been fed? The hogs haven't been taken care of. There is a load of corn to be unloaded, and I want to get ready to go to town. I wish when you fellows are here you would think a little bit about my business." Right there we have established one of the greatest barriers that ever existed between two institutions, the school and the home. If the schools are to mean to the home in agriculture what they should mean, we must break down that barrier and we must bring the people and the teacher together.

So when we hire teachers we hire them for twelve months. They go into the homes during those summer months, and study the life of that country, the life of that mother, and the work of that father, and you and I go into the school in the fall with a deeper appreciation of the needs of that community. Surely the application of the lessons that are to be learned will mean more to that boy and girl and that community life than they will should we spend the summer in some faraway summer resort.

These are the things that we are working for. These are the things that consolidation will bring, and these are the things that are going to bring this change from the little one-room non-developed school, to the larger institution where we can get the trained teacher, where we can get the equipment, where we can get the life we should have. Then that larger school will go farther in the development. It will alow us there a community center where we can have and hold our farmers' institutes, our corn shows, our domestic science demonstrations, our club meetings, and all of those things, and that life is the one that we need. Money alone will not keep the boys on the farm. It is shown it will take them away. Railroads have been built, commercial enterprises of one kind and another have sprung up. They have held out the almighty dollar and have said to the young man on the farm: "Come into our line because we can offer you more money, more luxury of life, and you will have a better time." I want to say, they are going from the farm and they are going mighty fast. I known that to be true. We had some young men come from the farm into Purdue to take engineering, and not long ago I was down in Southern Indiana, and an old farmer came up to me and he asked me if I knew a certain boy. I said, "I don't know that I do, but what course is he taking up there?" The old man stopped a minute and scratched his head, and said: "Well, I just don't know what course he is taking, but he is taking that one where he gets $150 a month when he gets through." That is what he came to college for, not to get a degree, but to get knowledge of a given kind which would enable him to go into railroad work and get a high salary as had been pictured to him by some man who had been influencing him along that line. Those are the things that we have got to counteract. You can talk about blue sky, you can talk to me about the open country, you can talk about men being their own boss, but I want to tell you unless you can show the boy that he can make dollar for dollar on the farm with any other business on earth, you can't keep him there. We have got to show him that.

Then after we have done that, we have got to show him that living in the country is just as fine and just as high and just as enticing as is the life in town. Domestic science in the schools, and these other movements, these clubs, that great rural factor, the church, all combined with the school, are surely going to give us that life. It is going to help men who are trained on the farm to farm intelligently, get us greater production, furnish us a food supply so necessary for this rapidly increasing population of this country, and now for other countries, and then work with these other institutions that will give country life and make country life better than any other, and there we will be able to place on the soil out in the open country a citizen that the banker-farmer and all other classes and organizations will be mighty proud of.

The "Garden Spot" of Missouri

This Is a Designation Richly Deserved by the "Drainage District" of Southeast Missouri

Here is where farmers produce 40 bushels of wheat and 100 bushels of corn per acre, and the reason of it is that it is impossible to conceive of a soil more rich than ours. Never has Southeast Missouri presented a picture of greater opulence than this year. Everywhere the eye is greeted by great piles of wheat straw and jungles of corn. Truly this is a "Land of Plenty"—a land where Corn, Wheat, Alfalfa, Cotton, Watermelons, etc., flourish as nowhere else in the Mississippi Valley. What's the use of farming on worn-out land when you can get hold of a farm down here that will produce as much in one year as your worn-out farm will in four? We have a lot of fine farms for sale in the Malden District and every one of them will double in value during the next five years. This district is as healthy as you can find anywhere and you will have good schools and good neighbors. Write and tell us what size of farm you want to buy when we will give you the full particulars. Write to any Malden Bank about our honesty.

The Malden Real Estate Co.

Malden Mo.

STATE NORMAL SCHOOL, KIRKSVILLE

In the past twelve months, the Normal School at Kirksville enrolled more than 1700. The average attendance was 750. The summer term attendance was 1035. In spite of droughts and excessive rainfall, all records were broken.

In the twelve months, 337 graduated: Those securing the 120-semester-hour diploma with bachelor's degree numbered 28; the 90-hour displomas, 65; the 60-hour diploma, 42; the elementary certificate, 175; the special rural state certificate, 27.

The fall quarter opens Tuesday, September 7, with a faculty of more than fifty high-grade experts and with improved facilities for teaching all subjects of possible interest to ambitious young Missourians who may desire to teach in the public schools.

Room and board will be as low as the lowet and as good as the best. Faculty, president, and students extend warm welcome to new students who quickly catch the step and feel at home in the atmosphere of this one of the greatest of Missouri's institutions.

For bulletin and explanations, address
John R. Kirk, President.

Miss Grace West of McCredie, Mo.

The above is a good likeness of Miss Grace West of McCredie, Mo., who is one of the young women who recently won free round trip Railroad and Pullman ticket to the great Panama Exposition. Recently she wrote us the following letter:

"I am herewith inclosing my last bunch of subscriptions to your good paper and I am now ready for my trip to the Fair—or rather I will be as soon as your next bunch of girls are ready to go. Getting the necessary number of subscriptions was more pleasure than work for it is easy to get farmers to subscribe for a fine paper like The Missouri Farmer—and once my friends found out that I was working for this great "free trip" they were more anxious to help me than ever. Your offer is so fine and generous that it seems to me some girl in every community in Missouri would go out and win it—and any girl can easily do it in a couple of weeks' time. I have always wanted to see California and the Rocky Mountains but I never thought I would have an opportunity to do it so easily. Now I will see not only the "Golden West" but the great Exposition besides. I do hope a lot of other girls will take advantage of this splendid opportunity."

As Miss West says, this is indeed a "splendid opportunity" and there is a chance for some bright girl in every community to win this great free trip. A couple of weeks' work will do it—and you can join a party of our "Panama Girls" and thus make the trip together with much more safety than you could go alone. If you are interested, write us for the full particulars today. The Missouri Farmer,

The Missouri Farmer,
Columbia, Mo.

Gentlemen: I herewith send the picture of Mollie Fair, from which you will make cut for my ad in The Missouri Farmer.

I must say that I think Mr. Royce made a great selection for me when he bought Silver King. I am intensely interested and proud of this boar.

I will certainly have some herd boars in the bunch of pigs that I have coming on. They certainly have the backs, hams and plenty of stretch and spots.

Very respectfully,
B. B. Megown.

A Great Offering of Poland Chinas

J. F. Richards & Son, Bevier, Mo., will open the 1915 sale season with an offering of Poland China bred gilts and boars of 42 centimeter caliber.

The sale will consist of fifty head and will include 22 head of boars and 28 head of bred gilts and as a whole will comprise as high class offering as will be sold in Missouri this fall. In fact, breeders and farmers who are in the market for Poland Chinas that are right in every way can not afford to miss this sale and will in no way be disappointed with the character of hogs cataloged.

To begin with the "Pen-Yr-Hyl" herd has stood in the first rank since its establishment a number of years ago. From the very first Mr. Richards, who is a very critical judge of livestock, selected only foundation stock that was outstanding. The brood sows and herd boars that have found a place in this herd were selected from the leading herds of the breed. Size was, of course, insisted on, but size alone never caused Mr. Richards to buy a single hog—it took more than scale to gain a place in this herd. Quality along with size was the standard used and only when these two essentials were found combined, and backed up with bloodlines that would stand an acid test would Mr. Richards buy. As a result of this policy a collection of Poland Chinas of the very highest order was assembled, and today no breeder that the writer is familiar with can show more size and quality than will be found in this herd. Perhaps the success of this firm depends very largely upon the herd boar Pawnee Price 172137. This boar is regarded by the writer as one of the most valuable sires of the state. He is a son of Big Price, one of the best sons of the great Pawnee Lad. Big Price was a son of Anna Price II, one of the most famous sows of the breed, and a sow who figures in as many high class pedigrees as any other sow. The dam of Pawnee Price was Lady Chief Price, a granddaughter of Long Wonder.

Pawnee Price is not the big rangy type so often encountered, whose sole excuse of being used is their ability to pull down the scales. Picture a large boar—an extremely large boar, with a wonderful head and ear, smooth laid shoulders, a wide, strong, nicely arched back, carrying the width from front to rear to perfection, deep, smooth sides, wide, deep hams, great bone and feet, and—quality, and you have a fairly accurate picture of this boar.

The junior herd boar is Wonder R. 213297 by Big Wonder R. by Big Wonder, and is out of Jane Fawr, one of the valued herd sows by Big Wonder by Longfellow Jr. The second dam is by Chief Price 4th, one of the stars of the breed. Wonder R. was selected by Mr. Richards only after he was convinced that he was a worthy boar to use on Pawnee Price gilts, and the wisdom of this selection is borne out in the character of offspring that will be found in the sale.

These two boars are the sires of most of the offering, and the gilts are bred to one or the other of them for September and October farrow.

Space borbids detailed comment on the entire offering but we will mention a few. Three April yearling gilts by Pawnee Price, out of the good sow A Wonder Girl, by Fessenmyer's A Wonder, are real attractions. Two July gilts by Pawnee Price, out of Queen Bevier by Expansion Wonder, have exceptional size—one in particular has great stretch and bone. Seven gilts and two boars by Wonder R. and out of Wonder Giantess II by Great Wonder by A Wonder represent one of the top fall litters that will be sent through any sale. A fall boar by Long Expansion and out of Leading Lady will look mighty good to any one wanting a top boar with size and quality.

A great deal more could be written about this superior offering but lack of space prevents. In conclusion, bear in mind that this sale consists of an offering that will please any one. No sale will offer a more desirable lot. The gilts are all showing down with pig. Among the boars are a number of herd boar prospects. The entire lot will be offered in excellent condition. The catalogs are ready to mail and will be sent to all who write. We recommend this sale to our readers. R. P. Royce will represent this paper and bids entrusted to him will be handled honorably.

Bland's Poland China Sale

On Thursday, September 8, Halleck Bland will hold his first public sale of Poland Chinas from his well known Long Branch herd. Mr. Bland has been before the buying public in the capacity of a breeder of pure bred hogs for fifteen years, and because of the merit of his stock and his reliable business methods, he has succeeded in building up a large trade., Heretofore he has sold all his hogs at private treaty, but this year he has decided to invite breeders and farmers to bid on his stock in a public sale. It is the ambition of every man who engages in the pure bred live stock business to sooner or later hold a sale—many attempt to hold an auction before they really are ready. Mr. Bland has not made this mistake. He has been getting ready for several years and the lot he has cataloged consists of a highly desirable offspring. Fifty head are listed for sale and includes nine bred sows, six spring yearlings, five fall gilts, sitxeen spring gilts and sixteen spring boars. All but one tried sow have been bred by Mr. Bland

Pawnee Price,, senior herd boar in J. F. Richards & Son's herd. Pawnee Price is the sire of some great gilts in the sale.

Choice spring boars and gilts. Fall boars and gilts. All sired by Giant Mammoth, Governor Hadley and Mammoth Wonder. Satisfaction is guaranteed. Have shipped to 23 states.
H. O. LINHARDT, LOHMAN, MO.

and are sired by Kink David 719465, Leader 201105 by Grand Leader, and by See Wonder 229589 by Pritchett's A. Wonder.

Just a word regarding these boars. Ask any man in touch with Poland China interests in Missouri to name the ten best boars and most of them will unhesitatingly count King David in the list. King David is a boar of great scale, with extreme bone, and a world of quality. Today, at the age of five years, he is as smooth as most young boars. He is by the great old Long King, a boar that contributed so much to the improvement and popularity of the big type Poland China. It might be of interest to know that just a few dayss before his death Mr. Pfander wrote Mr. Bland for a price on this boar. Pigs sired by King David show exceptional quality and size.

Leader is one of the best sons Grand Leader ever sired and he has given good account of himself in the Long Branch herd.

See Wonder is a two year old boar by A Wonder and out of Lady Big Bone. This young boar gives every promise of developing into a worthy successor of King David. The majority of the spring gilts are by this boar and are the kind discriminating buyers are looking for.

The sows that are bred, will farrow to the service of either King David or See Wonder. Five fall gilts will sell open as will the spring gilts. Gilts No. 1, 4 and 6 are by the son of Long King and are real attractions. Among the boars are several good herd boar prospects, especially one by King David out of Expansion Lady by A Wonder, and one by See Wonder out of Eva Long.

This sale is worthy of the consideration of our readers who are in the market for the good kind. The catalog will be mailed to all who write. R. P. Royce will represent this paper at the sale and will be glad to render any service to our readers. Write at once for catalog and mention The Missouri Farmer.

Choice Holstein Bull Calves

Elsewhere in this paper will be found the advertisement of The Missouri State Sanatorium, Mt. Vernon, Mo., in which they call attention to a number of choice bull calves from the institution's well known herd.

These young bulls are sired by Sir Missouri Josephine Chief 72328 and Wauseona Royalton Korndyke 117165 and are out of high producing dams. The herd is tuberculin tested.

For further information communicate with Wm. J. Salts, Steward, Missouri State Sanatorium, Mt. Vernon, Mo.

Megown's Spotted Polands

Last week the writer visited the herd of Spotted Poland Chinas owned by B. B. Megown, New London, Mo., and found the herd in excellent shape. The young boar Mr. Megown is using, Silver King, by Spotted King, has developed into an exceptionally good young boar. He promises to be a very large boar and present indications are that he will be very smooth. Silver King is put up on very pleasing lines, carries unusual width, is especially good in the hams and has great depth. He is nicely spotted himself and his pigs carry plenty of white.

Mr. Megown can furnish a nice lot of spring boars and gilts by Silver King and out of sows carrying the blood of Brandywine, Budwiser, Billy Sunday and other noted spotted boars.

Mention this paper when you write.

Taylor's Durocs

No better values are offered by any breeder than are advertised by Chas. L. Taylor, Olean, Mo. Mr. Taylor is offering bred sows, bred gilts, yearling boars and spring boars and gilts sired by Col. Wonder, grand champion at the Missouri State Fair in 1913 and sire of the grand champion sow at the same show last year. This herd is conceded to be one of the top collections of the breed and at the prices asked no breeder or farmer should be without some of the blood that has made this herd famous. No matter what you want, Mr. Taylor can fit you out from a spring pig to a complete show herd.

Riggs Poland China Sale Oct. 7th.

Your attention is directed to the new advertisement of N. R. Riggs, Lawson, Mo., announcing that his annual sale will be held at Crystal Springs Farm, Thursday, October 7.

Each year Mr. Riggs selects the top boars and gilts from his good herd and prepares them for public sale—and believe me, Mr. Riggs surely knows how to get the growth. Of course a great deal of credit belongs to Jumbo Orr, the herd boar, and to the remarkable good brood sows in the Crystal Spring herd, but no small amount of credit is due Mr. Riggs' ability as a feeder. He has made a study of this great question and no one can give him pointers on how to do it.

The offering this year will be up to the standard of former years and we suggest that you ask Mr. Riggs to put you on his mailing list.

Need a Duroc Herd Boar?

Beginning with this issue our readers will note the new advertisement of W. C. Watson, New London, Mo., calling attention to a number of desirable spring boars that are now ready for sale.

Mr. Watson is one of the progressive breeders of this state and he is building a herd that promises much. Mr. Watson has endeavored to select his foundation stock from the best and he has been willing to pay the price for the good ones. The young boars he is now offering are of February, March and April farrow. Two of them are certain herd boar prospects. They were farrowed in February and are out of the great sow Tattletale 39th, one of the best sows sold last winter, and are sired by Illustrator. How does that pedigree read?

Tattletale 39th was 1st in class; 1st in three herds, and junior champion at the Illinois State Fair in 1913; 1st in class; 1st in three herds; 1st in get of sire, and junior champion at the International Live Stock Show in 1913. Illustrator is too well known to need much comment. He is a champion himself and a sire of champions. Sows bred to him last winter averaged $175 in Dr. Still's sale. The balance of the boars are sired by Crimson Chief Again 119917, the boar Messrs. Watson and Keithley purchased about a year ago in H. S. Allen's sale. Write Mr. Watson for prices.

Look up the advertisement of J. C. Briggs, Hume, Mo., in which he offers good values in Duroc boars and bred gilts. Mr. Biggs advises us that these are the big kind and that he is pricing them very reasonable. Mention this paper.

Black and White Farm Holsteins

Attention is directed to the new advertisement elsewhere of The Black and White Farm herd of Holsteins. This herd is one of the good herds owned in Missouri, and a specialty is made of developing maximum producing cows. At the head of the herd stands the richly bred bull Dutchland Sir Hengerveld Rag Apple 99771 and the young bulls offered for sale are sired by him and are out of some of the very best producing cows in the herd. Herewith is a picture of one of the good cows. This cow, Alice Pietertje Belle Pauline 2nd, is a daughter of Brookside Hengerveld Paul 2nd, a bull with seven A. R. O. daughters. We can recommend this herd to our readers. Write Mr. E. M. Holbrook, Baden Station, Route 30, for prices and any other information.

One of the good cows in the Black and White Farm herd of Holsteins owned by E. M. Holbrook, Baden Station, Mo. This farm offers a number of good young bulls.

JERSEY CATTLE

JERSEY CATTLE
Bulls ready for service. They are sired by the Owls Champion 85990. His grand dam on dam's side, Rubano's Fancy, has a record of 21 lb. 10 oz. in 7 days. We have these young bulls for sale at a price that ought to move them. Also a few heifers.
Wm. H. Bruns & Son, Concordia, Mo.

Richards & Son's Superior Poland China Sale

At Pen-Yr-Hyl Farm, Bevier, Mo., Wednesday, Sept. 8

FIFTY HEAD---28 Bred Sows and Gilts, 22 Boars, All Good

THE GILTS: We have selected for the sale the most attractive and useful lot of gilts we have ever put through a sale ring. Every one is an outstanding good brood sow prospect, They have unusual size, heavy bone, and as much quality as we have ever seen. Several of them are counted by critical judges to be as good as will be sold this year. Every one is of our own breeding and represents the best blood that we could buy. One tried sow, three April yearlings, two July yearlings and twenty-three September gilts. They are either sired by or bred to our herd boars:

Pawnee Price 172137

Is our ideal of a big type Poland China boar, in every sense of the word. As an individual his equal will be hard to find. He is sired by BIG PRICE by PAWNEE LAD. The dam of Big Price was the great sow, Anna Price II. His dam was Lady Chief Price by Miller's Chief Price by Long Wonder. No better bred boar can be found. As a breeder he has met our highest hope. Come and see for yourself. A sow by him or bred to him will strengthen any herd.

Wonder R. 213297

By Big Wonder R, by Big Wonder, and out of Jane Fawr by Big Wonder is our junior herd boar. Many of the very choicest boars and gilts are sired by this great young boar. Wonder R. has every essential of a great boar and we know that buyers will like his get. Wonder R. sires extreme size and quality—that is why he is in our herd.

THE BOARS: We are cataloging 22 boars, 7 are September yearlings, 15 are of January, February and March farrow. Included in the lot are several attractive herd boar prospects, Buyers in search of the right kind need look no farther—big stretchy, heavy boned, high backed, nice headed and with quality. A good boar is half a herd—a poor one is more than half, We offer you the good kind.

We extend a hearty invitation to all who may be interested to attend our sale and become acquainted with the kind of Poland Chinas we are producing. The future never looked brighter for the man who raises the profitable kind of hogs. Catalogs will be mailed to all who write. Please mention this paper,

J. F. RICHARDS & SON, Bevier, Mo.

W. B. DUNCAN, THOS. E. DEEM, Auctioneers. R. P. ROYCE, Fieldman

Garrard & Son's Durocs

Brown Garrard, junior member of the firm of J. C. Garrard & Son, McBaine, Mo., reports that their spring boars and gilts have done well this summer and that they are now ready to ship February pigs of either sex, sired by Champagne and Mr. Columbia, the two herd boars in service. Champagne is by Whiskey and Faith, and Mr. Columbia is by Firestone.

Messrs. Garrard are producing good useful Durocs that they sell at moderate prices.

Sunset Jerseys

The Ennis Farm, Horine Station, Mo., offers two excellent heifers, one to freshen soon and one in the winter. Special prices are being made on these two heifers and a young bull old enough for light service. The Sunset herd ranks high and many of our readers can testify to the quality of Jerseys produced. Mention this paper.

Durocs and Shorthorns

J. E. Weller, Faucett, Mo., is advertising choice Duroc boars and gilts of spring farrow sired by his herd boar, E. Pluribus Unium. Mr. Weller has been engaged in the Duroc business a number of years and has built up a herd that he is mighty proud of. A number of good gilts and sows have been bred for fall farrow and should be very attractive to those of our readers who are in the market for this class of stuff.

Mr. Weller advises us that he has two extra good useful young Shorthorn bulls that are well bred that can be bought worth the money.

Crosby's Clydesdales and Jacks

F. L. Crosby, Mexico, Mo., is offering exceptional values in Clydesdale stallions, mares and colts. The Highview stud is the outstanding good collection of Clydesdales in Missouri and for several years past has been very prominent at the State Fair. There never was a time when the outlook for good draft horses was brighter than at the present time. Mr. Crosby also has a number of high class jacks for sale at prices that should prove interesting to any of our readers who are in the market. Write Mr. Crosby for particulars and arrange to see his exhibit at the State Fair.

From now on Missouri farmers must produce a better class of heavy horses if they expect to attract the good buyers. The little farm chunk is not wanted anywhere. Only the big kind with quality can compete with the motor truck and farm tractor and producers need have no worry that these will be supplanted by any mechanical power.

Baker & Son's Polands

W. A. Baker & Son, Butler, Mo., who advertise Poland Chinas in this paper, write that their show herd is coming along in great shape and that they will have out a strong exhibit. Messrs. Baker are producing the kind that meet with ready appreciation from careful buyers. Watch for their herd at the fall fairs. In the meantime if in need of a strong young boar we would suggest that you write Messrs. Baker at once. Mention this paper.

Spring Grove O. I. C's

S. D. & B. H. Frost, Kingston, Mo., can furnish a cracking good lot of fall and spring boars at prices that will be hard to duplicate. The Spring Grove herd is one of the oldest and best collections of the breed. Mention this paper.

Shorthorn Bulls and Heifers

Our readers are referred to the advertisement of June K. King & Sons, Marshall, Mo. ,in which this well known firm offer a few extra good young Shorthorn bulls and heifers. Messrs. King have long been counted among Missouri's constructive breeders of Shorthorn cattle and Berkshire swine.

Any of our readers who are in the market for either Shorthorns or Berkshires will be serving their own interest if they investigate the Peabody herds before making their purchases. Mention this paper when writing.

Angus Bulls

D. L. Sutherland & Sons, Windsor, Mo., advise us that they have for sale an unusually strong lot of young Angus bulls. These youngsters are well bred, representing several of the most popular families of the breed, and have been grown under good farm conditions, and their future usefulness is assured. Our readers will find Messrs. Sutherland very satisfactory gentlemen to deal with. Kindly mention The Missouri Farmer when you write.

POLAND CHINA SALE

Centralia, Mo., Thursday, Sept. 16

FIFTY HEAD OF THE GOOD KIND

This is my first public sale and I have selected the kind that I feel justified in asking the public to bid on Included in the offering are 9 TRIED SOWS 6 SPRING YEARLING GILTS, 5 FALL GILTS, 16 SPRING GILTS and 16 SPRING BOARS.

The entire lot represents my best efforts as a breeder, they are sired by KING DAVID 170565—the best living son of LONG KING; LEADER 201105 by GRAND LEADER, and by SEE WONDER the best son of PRITCHETT'S A WONDER I ever saw.

The tried sows and yearlings sell bred to KING DAVID and SEE WONDER.

Sale will be held at Fair Grounds near town.

Catalogs will be mailed to all who ask for one.

HALLECK BLAND, Centralia, MO.

Be Kind To Mother

How is the World treating you and yours anyway, my friend? Are you putting thought behind the things you do in order that you may utilize to the fullest both your hands and the finer talents with which Nature has endowed you? Are you permitting the harshness of the struggle to crush out of your heart all the kindly impulses and sentiments —rendering your life merely a cold and barren thing? I know only too well that the struggle is full of trials and disappointments—and yet if we only will we can put a pile of happiness into it after all. There is an old hymn which has for its chief refrain, "Let the blessed sunshine in"—and it is a sentiment which will lighten the day's toil it matters not how bleak the clouds may look. There are many beautiful flowers that grow by the wayside if we will only look for them. There is rich melody in the cry of the lark and the call of the quail if our ears are only attuned to hear it—and for the shadows of today there will be world's of sunshine in the tomorrows yet unborn and for the failures of the hour there will be successes in plenty if we only have the patience to await their coming. In the inexorable law of averages—if we faithfully do our part—the victories always overbalance the failures —so why put needless lines of worry into our faces and useless gray hairs in our heads—and most pitiful of all, why turn our hearts into things of stone which chill our own souls and render unhappy those with whom we come in daily contact?

"The incessant rains have spoiled your harvests" you say, "and last year's pitiless sun withered them up?" Yes, I know it's hard—but if the little bunch that gathers around your supper table are well in mind and body, is there not a mighty lot to be thankful for? And anyway, maybe during the next two or three years we will more than make up for our losses. So let's forget the things that couldn't be helped. Let's make the best of it and thank the good God above that at least health—the finest blessing in this World—has been granted to you and yours. Let's make closer and better chums of the children than ever before. Let's entwine their heart strings around ours while they are still young in order that they will cling more closely to us in the years to come. Let's make home a place where gladness and laughter shut out the disappointments that come with the day's toil—home, the joy of which should never be measured in dollars, bushels or pounds.

And above all else, let's have a care for the health and happiness of Mother—"Mother," in whose kindly heart and face there is more that is tender and sweet and beautiful than in any other being or thing this world has ever known. When, in the long ago you wooed and won her you promised to "protect and cherish her to the end"—and in the stern realities of these latter days, remember that vow and the fervor with which you made it years ago. Remember that while the wavy hair of her girlhood and the rosy cheeks may have given away to streaks of gray and lines of care—that, after all, she is the same old Sweetheart—only grown a little bit older and that now, as then, her heart will thrill at little acts of tenderness and affection which mean more to every true woman than the riches of ten thousand Golcondas or all the jewels in Christendom. The thing that is driving the roses and laughter out of the sweet faces of thousands of wives and mothers is the hunger for kindness—those little daily tender attentions from husband and children which put joy into a woman's life, it matters not how hard and harsh the struggle may be otherwise. Make her daily toil as easy as possible by saving her unnecessary steps and drudgery. Remember her birthdays and your "anniversary." Plan little surprises of joy for her now and then and when she asks for a dollar or two for herself give it willingly—for the home in which "Mother" is happy is a home which will stand secure against the storms of life, it matters not how hard they may beat against it.

THE LAND OF THE GRAPE AND THE PEACH

Friday and Saturday, August 6 and 7, as a representative of the Missouri State Board of Agriculture, I attended the Fourth Annual Grape Carnival put on by the Southwest Missouri and the Northwest Arkansas Fruit Growers' Association, and a more enjoyable time I never had. The exhibit of horticultural products was a credit to their loudest claims and a testimonial far more convincing than well drafted platitudes, skillful paintings or pretentious representations on parchment.

When you studied the well arranged and tastefully installed grape exhibits of some twenty varieties, including the small and the large in size, the red, white and black in color, your memory, unbidden, swept back over the pages of Ancient, Medieval and Modern history, both sacred and profane, and you thought of the bunch of this magnificent and historic fruit that required the combined strength of both Caleb and Joshua, aided by a strong pole, to lug out of the Promised Land into the camp of the ancient Israelites. You thought of the good judgment and keen power of selection on the part of old Father Aesop in using the grape in writing his valuable little book of fables.

You thought of the Great Teacher and the many times He referred to this fruit, and the vine that bears it, and the industry that was one of the leading occupations of the children of men, when He was here on earth. Some of the most beautiful metaphors and apt similes of the greatest agricultural and religious significance were drawn from the vine and its fruits by Him who knew the art of teaching better than ever known by mortal man. Their grape juice exhibit was such that would have gladdened the eye of a W. J. Bryan or any other champion of an innocent, non-intoxicating beverage.

I urged them with all of the force I could command, to build a grape juice plant, that they might be able to convert every bunch, pound or ton of their grapes into a commercial product that could be kept indefinitely, as compared to the highly perishable grape itself. This juice could be kept and marketed at a time when the price was right and thus bring into that part of Missouri and Arkansas a golden stream of revenue that otherwise would not be seen or heard of. I tried to point out to them that this could be done by the application of the crystalized principles of genuine and unfettered co-operation. Co-operation, that great touch-stone of success that has enabled a collection of individuals by pooling their mutual interest to accomplish Herculean tasks with a shout. Without co-operation the efforts of the individual, acting separately and alone, would be as puerile and as hopeless as the proverbial case of the ignoramous that tried to lift himself over the fence by his boot straps.

The peaches on exhibition were as fine as the grapes, and the display of the garden and the farm were such as to justify me in exhorting them to not rely upon any one crop, but to diversify even though their soil and their climatic conditions were admirably suited to horticultural pursuits. The exhibits of corn grown on upland and on the low land, the alfalfa grown on upland and on low land, the medium red mammoth clover grown on upland and low land, all these were such as to enable them to keep a few good dairy cows, a flock of chickens and enough hogs for their own meat; all these good wholesome things to provide a veritable rock in a weary land to shelter in a time of a storm. At a time when insect pests, a hail storm, a blighting frost, or some unforeseen force, or power, would render the fruit of the tree and vine a total failure.

I had the opportunity and the great pleasure of once more seeing the small grain of the county of Jasper and adjoining counties tucked away from rain and dew and sunshine, in the most beautiful and symmetrically built grain stacks that it has ever been my lot to see, except, in this part of our Missouri state.

While their wheat is dry and the grade improving, farmers in other parts of the state where I have been are trying to wring or torture a separation of grain and straw to their loss in dollars and cents and much vexation of mind and spirit. Just how long the farmers in some parts of Missouri will grow these valuable grains on high priced land, with high priced labor, throw the bundles together in loose, flabby shocks, to twist down take water and rot before the thresher comes to their rescue, this court knoweth not. W. D. McKee.

SWEET CLOVER OR ALFALFA

A reader from Montgomery County wants to know if sweet clover is as profitable a crop to grow as alfalfa and what we think about it for his section. Briefly answered we would say that where alfalfa can be successfully grown that it is to be preferred but sweet clover will grow under conditions not favorable to alfalfa. I am satisfied that you can grow sweet clover most anywhere in Montgomery County, while on your level prairie lands and the white oak lands you can not grow alfalfa without considerable previous preparation and some little expense for drainage, lime and manure.

Sweet clover grows rapidly, has a deep growing, large tap root and is one of the very best crops we can grow on poor land to build it up and put it in condition for alfalfa or other crops. Sweet clover is not perennial like alfalfa but is seeded one year in spring or late summer and the next year will produce a hay crop and a seed crop and then must be re-seeded or plowed up. Some men claim to keep a permanent stand by seeding the ground two years in succession. In this way there is a new crop coming on every spring along with the old and a perpetual stand maintained. Where it is allowed to grow in pastures and along road sides there is enough seed dropping off every year to seed the ground and keep up the stand.

Sweet clover likes a firm seed bed and for that reason it seems to do very well sown on rye in the spring and the rye pastured off. It may also be sown with a light seeding of oats on fall plowing or on corn land without plowing, merely disking the corn stubble.

While some farmers claim that stock will eat sweet clover readily from the start our own experience has been that they must be forced to eat it until they acquire a taste for it and after that there is no trouble. It is used for both hay and pasturage and makes a good quality of hay, but the sweet clover has so much water that it is rather harder to cure than most other hay crops.

We know of no other crop that is better for green manuring because of both the rank top growth and very large and deep root. Joe Wing says that in the limestone soils of Kentucky, Alabama and Mississippi sweetstone clover is doing wonders and after it is grown a few years then bluegrass takes hold readily.

One difficulty has been in getting a stand. There is such a large percentage of hard seeds in most of the seed that only a poor stand is obtained the first year. A machine has been invented that will scratch these hard shelled seeds and when that is done the seed will germinate as well as clover or alfalfa. So in buying seed it will be well to ask for the treated seed. There is no doubt that sweet clover deserves a more extended place than it now has on Missouri farms.

Hidden Factors of Service

Records kept like this are practically useless for the management of a business. Efficiency is impossible and funds for improvement cannot be obtained.

Records, statistics and accounts kept like this are available for a complete knowledge of the cost and efficiency of each department of the business.

Such methods result in a telephone line which can give only poor service.

The result of such records is a telephone line like this, which gives good service.

The subscriber knows the difference! He demands a well-informed, intelligent business management.

What Kind of Lime?

A reader from Illinois, Mr. P. Hostetter, writes to inquire as to the relative value of quick lime, hydrated lime and ground limestone for sweetening the soil.

The reply is by Professor M. F. Miller, department of soils, University of Missouri:

As to the advisability of using quick lime instead of ground limestone for alfalfa I will say, that it all depends upon the relative cost of the two when their sweetening power is considered. To be exact, 1120 pounds of burned lime when made from very pure limestone is equal to 2000 pounds of the same limestone ground to a very fine powder. If the ground limestone is not finely pulverized, however, and one wishes immediate results, 1120 pounds of quick lime might well be equivalent to three or four tons of ground limestone. Of course in applying this quick lime it must be slaked with water, after which it assumes the form of the hydrate of lime. In that form about 1500 pounds is equivalent to a ton of ground limestone.

In order that lime of any kind may sweeten the soil it must be thoroly mixed with it so that no part of the surface four or five inches of soil is free from these fine particles of lime. Lime is not readily soluble and does not distribute through the soil naturally, hence this need for thorough mixing. Of course if three or four tons of coarsely ground limestone were applied the effect of this would last through a much longer time than would that from the smaller amount of quick lime.

Considering the fineness to which limestone is now being ground I think it can be safely said that it would be very much cheaper to apply at $1 per ton than the hydrated lime at $12.50. Five dollars an acre or $2.50 a ton for a two ton application is a fair price for ground limestone applied. I am of the opinion that you would get better results from a dollar invested in the ground limestone than in hydrated lime with this comparative price, provided the ground limestone were ground to the customary fineness, that is, such that 80 or 90 per cent will pass a 20-mesh sieve. Of course where one is putting out only a small amount of alfalfa and does not wish to order a large amount of ground limestone and where he could get the hydrated lime at $12.50 per ton in broken lots, he might prefer this even at the higher price.

It is now time that alfalfa should be sown that it may have time to get a good root hold before winter. No one should make the mistake however of trying to get a stand of alfalfa on fresh plowed ground on land where a heavy growth of weeds has been plowed down. Alfalfa land should be thoroughly packed and for that reason the ground should be plowed and worked down some time before sowing.

The Missouri Farmer

VOLUME VII SEPTEMBER 1, 1915 NUMBER 17

Why Not Make Missouri a Great Dairy State?

Geo. B. Ellis, Managing Editor

A few weeks ago we gave an account in the columns of The Missouri Farmer of the sale of sixteen dairy cows by a DeKalb county farmer for $6500 or a little more than $400 a head. This small herd of sixteen cows brought enough cash to pay for a good 80 acre farm at $80 an acre. In what other way could a young farmer so easily pay for a farm or provide for the education of his children or for any of the pleasures of a refined home as he could do by bending all his thought and energies to the production of high class dairy cows? The illustration above is an exceptional sale and shows only the possibilities in the production of dairy stock at the present time but if we take the good plain dairy cow—the one any intelligent farmer can produce in the first or second generation of a herd—we will find that these good plain dairy cows, producing around three hundred pounds of butter fat a year will sell for enough a head to more than buy an acre of good farm land. Quite recently one of the readers of The Missouri Farmer refused $125 a head for some high grade good producing Holstein cows. Even at these prices it appears to the writer that any young man with good health and a determination to win can own a farm in a few years if he will pin his faith and tie up his prospects to the dairy cow.

Six Jerseys Produce $1031.10

A Missouri farmer recently writing to Hoard's Dairyman says that he started with a herd of six registered Jerseys, two cows and four heifers only three years ago and for the year beginning April 1, 1914, and ending March 31, 1915, he received from this small herd a gross income of $1031.10 and a net income after feed and pasture was paid for $553.10. And so it matters not whether we take the Holsteins or the Jerseys or whether we produce milk cows or milk products the man who takes up dairying in an intelligent way stands a good show to win.

It would not be wise for every farmer in Missouri to go into the business of breeding dairy cattle or into the production of dairy products but our natural advantages are such that there is room for thousands of highly specialized dairy farms in this state and the men who see this opportunity now will be on the ground floor and in a position to reap a harvest when the general awakening does come.

No farmer need be afraid of the future stability of the dairy industry. The United States is comparatively a very new country yet. While in Europe much land may be found that has been in continuous cultivation for more than a thousand years, we have not much land in this country that has been in cultivation for a hundred years. But in this country new and undeveloped as it is the dairy products of the United States amount to something more than $800,000,000 annually. The only farm crop we have that is worth more than our yearly dairy product is corn and yet with this large production we have not kept pace with the demand and millions of pounds of dairy products are imported and the amount imported is increasing rapidly. In 1912 there was brought into this country dairy products to the amount of $10,029,853. In two years, that is for the year 1914, the importations had increased more than fifty per cent or to a total of $15,403,143. The bulk of our dairy imports come from Italy, Switzerland and France and mostly from the first two. Our city population is growing so much faster than the rural population that the demand for milk, butter and cheese is in no danger of being oversupplied for at least a great many years. Furthermore, the high prices for meats has caused a greater reliance on dairy products for the food supply of cities and this condition will continue to increase in favor of dairy products as the country grows older.

Poor Cows Cause Failure

The reason some men have failed to make a success of the dairy business is that they have started with poor cows. There are hundreds of cows kept on the farms of this country and milked, housed and fed for a yearly product of 150 pounds of butter fat. No man is going to make a success of dairying who can not bring his cows up to at least double that amount. In the case of the Missouri farmer previously referred to in this article, he made an average of 7,221 pounds of milk and 372 pounds of butter fat a year from his herd. A few years ago a groceryman in Southwest Missouri started into the dairy business with a bunch of Jersey cows and in a very short time brought the herd up to an average of 400 pounds of butter fat a year. In order to do this the man who starts in the dairy business must realize two fundamental things. That a good herd of cows is the result of selection, breeding and care. No matter how much care is bestowed on a herd or how much intelligence is used in feeding a balanced ration a large production is impossible unless you have the right kind of cows. As the result of a cow census taken in several states it was found that on farms where the dairy-type cows were kept there was an average annual net profit of $17.98 a head, while about an equal number of herds not of dairy type returned a profit of only $2.03 a head. These figures were made up from investigations of several hundred herds taken just as they were found in typical farm communities in Iowa, Wisconsin, Indiana, Ohio, New York, Pennsylvania, Connecticut, Vermont, Minnesota, Michigan, New Hampshire, Massachusetts and Illinois.

Select a Good Bull

The first step for the farmer who has made up his mind to establish himself in the dairy business is to start with the right kind of cows. For the man who is without much working capital it may be necessary to start with whatever cows are already on the farm or as may be picked up in the neighborhood but the very day the dairy is started the weeding out process should begin by keeping a separate record of each cow's product and as often as it is found that a cow is not paying she should be sent to market and a better cow put in her place. This may seem to be a slow process but a big change can be made in any herd in two or three years. Equally important with this weeding out process is to start at once to improve the herd by using a pure bred bull from a line of high producing cows. In selecting a bull do not take one unless his dam and grand-dams were capable of producing 300 pounds of butter fat in a year. This is the minimum standard but as the herd is improved and the young heifers come along to improve the average the wise dairyman will raise the standard for the bull to 350 and later to 400 pounds. In buying a bull pay more attention to the record of his immediate ancestors than to anything else. Good authorities agree that a good bull should increase the average production of his progeny of 1000 pounds of milk and 40 pounds of butter fat per cow per year above that of their dams. The Ohio Station reports one Holstein bull used on the station herd that increased the average production of his seven daughters 1,299 pounds of milk and 40 pounds of butter fat a year above that of their dams. "Forty pounds of fat per year for 6 years (average producing period) by each of 7 cows would be 1,680 pounds of fat; 1,680 pounds of fat at 30 cents a pound equals $504. This animal cost $100 when a calf." A Jersey bull used at the same station decreased the average production of his 11 daughters over 700 pounds of milk and over 45 pounds of butter fat per cow below their dams. This bull caused a loss of $891. The difference in money value of these two bulls, the first improving the herd by $504 and the other losing by $891 is $1395. Had the first bull been bought at $500 he would have paid his own cost in the betterment of the first seven of his heifer calves, while the second bull would have been very costly as a gift.

Stick to One Breed

"In improving by 'grading,' it is very important that successive sires be of the same breed. By using this method, a few generations will give animals which, so far as appearance and production are concerned, cannot be distinguished from pure-bred animals. Four generations make them fifteen-sixteenths pure. So far as production is concerned, a grade herd carefully selected and bred to good bulls of one breed is preferable to the average purebred herd without selection. Indiscriminate crossing, or the use of bulls from different breeds, gives very uncertain results. It is a serious mistake to think that by mating animals of one breed with animals of another breed the desirable characteristics of each may be retained. The chances are just as great that the undesirable characteristics will be retained."

Aside from the fact that either line of the dairy business, that is producing dairy cattle or dairy products, can be made to pay as well as any other line of farming, indirectly the question of keeping up the fertility of our farms should be the deciding point with thousands of upland farmers in Missouri. When the average wheat yield of the state is hardly fifteen bushels per acre there must be many farms producing less than ten bushels. And with an average yield of less than thirty bushels of corn there must be many farms producing no more than twenty bushels. Any farmer producing less than the average yield for the

Sixteen cows like above from a Missouri Holstein herd recently sold for $6500. There is no surer way to pay for a good farm home than to produce good cows.

state had better quit farming on his own account and work as a hired man. The average yield of wheat and corn will just about pay the farmer current wages for hired men. Any well managed dairy farm will show a yearly product of farm crops much above the average. As an example of the improvement in crop production brought about by dairying we mention the Hosmer farm in Webster county. Twenty years ago this farm had been so run down by grain farming that five or six bushels of wheat and fifteen or eighteen bushels of corn was about all that could be expected from the average crop. By keeping cows and selling butter, buying some feed and growing clover with grain crops and carefully applying the manure the production of the farm has been brought up to twenty-five and thirty bushels of wheat. In favorable seasons eighty and one hundred bushels of corn have been produced. But with this concrete example of what dairy farming will do for the soil there are hundreds of farmers going right along seemingly content with the yields the Hosmer farm made twenty years ago.

The state board of agriculture reports another farm in the Ozark country, that of N. P. Jacobsen, near Seymour in the southern part of Webster county, that shows the effect of good dairy practice on farm fertility. Mr. Jacobsen raises sixty bushels of oats to the acre, is not satisfied with less than thirty bushels of wheat and sixty bushels of corn. He is able to do this because he has a silo and keeps twelve cows and some other stock on a forty-acre farm. Dairying and fertile farms travel side by side. Compare the big yield of crops in Denmark, Holland and Switzerland, the dairy countries of Europe, with Russia, the great grain county. Russia shows the lowest grain yield of any country in Europe while all the other countries, rich in the number of dairy cows, are among the highest producing countries of the world and maintain a very condensed population in a highly efficient manner. If we take for illustration the dairy districts of our own country we find the farms are better improved, they have better roads and better schools than the districts devoted to grain farming. What better evidence do we want to prove to us that dairy farming will prove a great improvement over the present system of general farming practiced on so many of our farms in Missouri?

A Boy Who Made Good

In 1909 a young man from Lawrence County who was taking a special dairy course in the State University, was called home to take charge of the farm on account of sickness of the father, according to a statement made by P. M. Brandt. An average dairy herd of Jersey and Shorthorn cows, headed by a grade Jersey bull was in use on the farm. The young man took home with him three things which gave him better success than his father had. These three things were, a pure-bred Jersey bull, a pair of milk scales and a Babcock milk tester. At the end of the first year the scales and tester showed an average of 180 pounds of butter for each cow. Three years later the average had been raised to 300 pounds average. Cows with poor records were sold from time to time, eight were sold the first six months and better cows bought to fill their place. The bull was used with the best cows and in a few years a high class herd that will produce double the yield of the former herd will be the result.

FARM TRACTOR DEMONSTRATION

The question mark which the farmer originally placed before oil-burning tractors is growing dim. The tractor for all farm work is now a reality, and many farmers are buying tractors with which to equip their farms with power.

This sums up the most elemental tractor lesson taught at Fremont, Nebraska, by the Third Annual National Power Farming Demonstration, which came to a close Saturday, August 14. For one whole week the little city of Fremont was one of the busiest places in the great Platte-Elkhorn Valley. Special trains poured hundreds of visitors into the town, and streams of automobiles ran into the city constantly from every side. Thousands of farmers made pilgrimage daily to the colony of tents pitched on the plain some two miles from the paved streets of Fremont. Out of these tents every day there rambled an army of oil tractors to tear up the soil of some farm in the vicinity with deep rooting gangs.

Developments of the week show that although the farmers came like they were on a holiday, they were in a buying frame of mind. In this there is a difference from the previous demonstrations. Three years ago, when the national demonstration was originated at Fremont, the farmers came to see the tractors out of curiosity. Last year they looked with more interest than wonder, and this year orders for machines were many.

On the first day of the demonstration this year, one large company improvised a chart out of a window curtain, hung it in its tent, and wrote across the top "Names of purchasers; watch the list grow."

There was a tremor of uncertainty even in that camp, for the writing was small and the distance to the bottom of the curtain looked untraversable. But before the day was over two or three names announced that the buying had begun, and as the week rolled on and interest grew more intense, a new curtain had to be added, and yet a third, to hold the names. The final sales of this company alone stood well over eighty, and the list was composed largely of farmers. There were a few dealers among the number who, seeing the interest which farmers were taking, decided to buy a tractor for their show room to start things in their territory.

These sales are but a small part of the effect of the demonstration.

"Those buyers," said one experienced salesman, "are scattered all over this section of the Platte Valley country. Each man will get his tractor home, and many of his neighbors will get interested and have to have one just like it, like they are, you know, with automobiles. Harvest will not compare for busy season with what we will be up against in getting all these people fitted up with tractors."

The farmers were in a buying frame of mind, but that does not mean they were not determined to get the most for their money. During the plowing tests joined in by the tractors of thirty odd companies, the farmers were on hand with measuring canes, scattering all over the field, following the tractors up and down, measuring the depth of the plowing. Those tractors were most favored that turned the deepest furrows. As one farmer said, "We do not necessarily want to plow over six inches, but we do want to know that we have the power. The ground may get hard and there will be hills. We have got to have the power."

This throng of men absorbed in the work of these new farm power engines were not by any means all prosperous owners of large farms. Every type of farmer was represented. There were men who were evidently landlords with residence in town and tenants in the country. There were horny handed farmers, many of them owners of small tracts and some even tenants. There were patriarchs with flowing beards taking this farm power innovation very much as a matter of course. There were many farmers' wives, some of them speaking some North European accent, and all of them getting at facts of tractor farming for themselves.

The great majority of the sales were of the little tractors suited to the small farm, and with the power to pull two or three bottoms, or a disk harrow and a peg-tooth, or one binder or two mowers, or a manure spreader, or to run an ensilage cutter, a shredder, or a small thresher. It was the owners of small farms who bought most of the tractors at Fremont, and who will buy the most tractors today and tomorrow. This is because there are more small farms than large ones, and a tractor has now been developed which is admirably suited to the small farm with its large number of jobs demanding power.

The manufacturers are learning something from such demonstrations as that held at Fremont. They are learning that it is not enough to make a small tractor and ask a small price for it. Some assurance must be given the farmer that he can get some service along with his tractor, and that he will not find himself in a worse power dilemma than ever when, upon a break-down in the busiest season, he finds that he has to wait an indeterminate period to get a repair part. The farmer wants to know that there are plenty of dealers with repairs right in his home territory where he can get emergency help quickly when he wants it. He also demands that there be plenty of the employes of the company selling the tractor in his locality, so that he can get expert assistance in case he has initial trouble in learning the cardinal principles of tractor operation.

There have been more than one hundred manufacturers in this country who have undertaken to build farm tractors. Many of them have supplied examples for the successful manufacturers to avoid, and there are now few companies compared to the number starting in the business who are offering oil-burning tractors to the farmers. These are learning that they cannot mount a kerosene engine on three or four wheels, charge an insignificant price for it, and make a business success. The wise farmer measures the depth of the furrow, looks for complicated mechanisms which will get out of fix, wonders if the company is going to be in existence next year to sell him repairs, calculates the time it will take to ship repairs from the sales point nearest his farm, and does a lot more figuring that means trouble for the freak manufacturer who counts on building up a big business on a little merit. The farmer is in a tractor buying mood because he believes there are some companies that understand he is more concerned with quality than with price, and that he wants to buy service as well as tractor when he writes his check.

Geo. F. Whitsett.

This cut shows a number of tractors in the demonstration. A good deep furrow and smooth even plowing recommends the tractor to good farmers.

HOW TO GET RID OF HOG CHOLERA

J. W. Connaway, D. V. S., M. D., Veterinary Department, College of Agriculture and Experiment Station, University of Missouri.

[This article is a continuation of the articles in previous issues and will be continued until the whole subject of hog cholera control is thoroughly discussed. We suggest that every swine raiser who reads The Missouri Farmer should file away all these papers containing this article and they will then have the most valuable treatise on hog cholera that has been published.—Editor.]

Food and Water

For the maintenance of health in all animals the food and water supply should be of good quality and free from contamination with disease producing organisms.

The water supply was discussed to some extent under the section "streams" and "ponds" as disease carriers. Surface water if kept free from pollution is not objectionable, in fact often preferable to the deep-well water of certain sections. But the deep-well water is not so liable to become polluted with cholera germs, and if free from objectionable mineral substances, as salt, sulphur and excess of lime, is much to be preferred on account of the smaller danger of carrying cholera infection.

The food supply is rarely a carrier of cholera infection. But corn that is hauled in a wagon box that was used a short time previously to haul "sick and exposed" hogs to the shipping station, will certainly become contaminated with hog cholera virus and give the disease to hogs that eat of it unless the wagon box has been properly disinfected. Waste food in corn fields that have been partially hogged down may be contaminated with hog cholera virus if some of the hogs that were first turned on the fields were infected with the disease. Other hogs turned into the fields later may contract cholera if not previously vaccinated. Sick hogs should not be allowed to run in the fields where corn has been cut and shocked as their feeding and bedding about the corn shocks is liable to infect the corn and fodder and transmit the disease to other hogs.

The question is often asked: "Is

ankage' ever a carrier of hog cholera ıfection, since many cholera in-ected hogs are 'tanked' at the packing ouses?" There is but little danger of ansmitting cholera by feeding tank-ge. The tankage is subjected to a igh degree of heat and germs of all inds are destroyed. And if it is sub-equently handled in a manner to pre-ent it from becoming contaminated ith the germs of hog cholera there no danger in feeding it. Special are should be taken by the men who ack and handle the tankage to avoid arrying cholera infection into the ınkage storage room of the packing ouses. The men assigned to this par-cular work should not handle chol-ra carcasses, they should not go from cholera infected pen into the storage oom without first changing their hoes. Proper precautions in these espects will prevent the tankage from ecoming infected after it comes from he tanks.

Quality of the Food: Hogs are some-imes fed on immature, moulded or orm-eaten corn that is rejected as ood for horses and cattle. But hogs o fed will not thrive as well as when ed on corn of good quality. Such food s liable to contain, or form, poisonous roducts that cause irritation of the igestive tract, and disturbance of di-estion. Diarrhoea may result. The oor quality of the food is thus liable o render the hogs less resistant to holera, if they should become ex-osed to the virus of that disease. This also applies to the feeding of ıew corn if fed in excess. The starch n new corn is not fully ripened and s softer and more fermentable than in ld corn, that is well cured and hard-ened, hence it is more liable to cause igestive disturbances and a lessened esistance to cholera. New corn never reates cholera, but it can easily pro-iuce conditions in the hogs that ren-ler the animal more susceptible to the disease when exposed to it. Care should be taken to not crowd the new corn too rapidly to a full feed but to mix with it old corn and proper pro-tein supplements.

Balanced Rations: Hogs are fed for profit and the farmer desires to get the greatest profit possible out of the feed that goes into the hog. That is, he desires that as much of the food as is utilizable shall be converted into permanent tissue, flesh, fat and bone, and that none or but little of the nu-tritious elements of the food shall pass through and be lost with the indigest-ible waste products or lost in other ways. But in the matter of feeding the best results cnanot be attained with-out some knowledge of the "science of feeding." Many farmers have studied these matters and are profiting by them. And it is true that many farmers know how to put a large number of pounds on their hogs in a short period of time without knowing anything about "balanced ration," and by following a fixed plan of their own. But in the case of these it frequently happens that in getting their good gains in a short time they have not done it in the most economical way and have lost some of the profits that could have been saved. It is well, therefore, for every feeder to study the matter of "balanced rations", for this is the key to profitable feeding. It is not my purpose, however, to go into the details of this subject and to give specific formulae for rations of the various mixtures of food stuffs that should be fed to the breeding herd, the growing shoats and the fat-tening hogs. That phase of the work belongs to the Animal Nutrition De-partment. But it is proper to men-tion in this connection that the natural resistance to cholera is greatest in an animal whose physiological functions are kept at their best, and proper feeding is one of the essentials. Some mention of the principles of feeding is therefore pertinent and this I shall present in the simplest and most ele-mentary way.

The food stuffs upon which the ani-mal subsists must necessarily as a whole contain the same chemical sub-stances found in the animal body. The animal body requires three kinds of food substances: (1) Protein (or ni-trogenous materials) for the building up of the muscles and other active tissues. (2) Energy and heat produc-ing foods, as fats, occuring in the oils, and carbohydrates in the starches and sugars. (3) Inorganic foods (water and mineral salts). The animal body simply appropriates as much of the available chemical substances in the foods as it for the time being needs, or is able to store up for future use. The excess of these chemical sub-stances in the food eaten is eliminated from the body. And it not infrequently happens that this excess of food ma-terial that cannot be used by the ani-mal and is eliminated as so much waste material is in fact high priced food elements which the feeder is los-ing because he does not understand the physiological needs of the animal. To illustrate this matter roughly: Let us suppose that a lot of fattening hogs on full feed were left for a week in charge of a simple minded conscien-tious lad who knew nothing about feeding but was told the quantity of corn to give but misunderstood the in-struction and gave them daily twice as much as they could possibly eat. The result is easily seen, a gross waste of corn trampled and soiled in the mud and manure of the feed lot. But the same thing happens in a less degree and in a different way when hogs are fed on an unbalanced ration all the feed they will clean up. The feeder thinks that because the pigs eat up all the food given and they are taking on weight, the ration given meets the proper needs of the animals, while in fact they may be wasting con-siderable food for the owner and wast-ing some of their own enegry in the labor of eating, digesting, absorbing and trying to transform into body substance an excess of one class of food material in securing enough of another class and expending further energy in eliminating from the body the excess of this good but unusuable food material. This physiological mis-treatment of the hogs is not good for the owner's pocket-book, nor is it good for the health of the hogs. Certain organs of the body are overworked and the animal becomes less resistant to cholera. An example of this is sometimes seen in hogs that are fed exclusively on corn—a highly carbo-naceous, starchy food, a fat and heat producer. Corn contains some nitro-genous or proteid substances but not in sufficient quantity to properly bal-ance the ration. Hence a greater quantity must be eaten in order to supply the proper quantity of protein. And the result seems to be that the vital tissues are lacking in tone and resistance because of unbalanced nu-trition. The tissues are over-fat and flabby and the death loss in such herds is usually large when infected with cholera.

If a proper amount of protein is added to the ration in the form of tankage or oil meal, soy beans, alfalfa, etc., less corn will be required, the expense of fattening will be less and the animals will be more healthy and vigorous.

In our "Anti-hog-cholera club" work an animal husbandry instructor is a member of the team and to him falls the duty of teaching the club members what foods to select and in what pro-portions to mix them. The rations would vary according to the cost of the materials, yet proportioned so as to meet as nearly as possible the physological requirements of the ani-mal. I give herewith three rations that were recommended for dry lot feeding: "Mixture No. 1—Corn 5 to 6 parts and oil meal 1 part. Mixture No. 2—Corn 8 to 10 parts, middlings 2 parts and tankage 1 part. Mixture No. 3—Corn 10 to 12 parts and tank-age 1 part."

"Clover and alfalfa hay may be fed in racks to brood sows. Hogs on green forage need less of the supplements than when in dry lots."

Hogs are more healthy if they are provided with a proper amount of green food. Succulent food aids in keeping the bowels in good condition and prevents the constipation or clog-ging of the bowels that irritates and inflames the mucous membranes and thus gives rise to conditions favorable for contracting cholera. The follow-ing is recommended in regard to for-age crops from the points of view both of health and economical feeding: Pasture crops: "Use pasture crops to save grain; rye and wheat are good winter pasture, alfalfa is probably the best hog forage when it can be grown successfully." Alfalfa it should be re-membered is rich in protein food. Clover should not be overlooked as a forage food for hogs.

Exercise in connection with proper feeding is essential for the mainte-nance of health and vigor in hogs and this is especially important in the breeding herd. The sows and growing pigs should be made to work for their living. Pasture crops should there-fore be provided. In addition to the other forage crops a rape patch will provide an abundance of nutritious succulent food during the summer and fall, and will give the hogs exercise in gathering it. The "Dwarf Essex" variety of rape should be sown. Many farmers have been disappointed in trying to grow rape for hog pasture on account of sowing the "bird rape" instead of the Dwarf Essex. The lat-ter provides a luxuriant foliage, and continues good until the hard killing frosts while the "bird rape" runs up a spindling stalk and goes to seed. The practice of "hogging down" corn gives the fattening hogs healthful exercise, and is an economical way of gathering the crop and spreading the manure on the corn fields. Hogs kept out on the fields are not so liable to become ex-posed to cholera as those crowded to-gether in feed lots. And the slight loss of feed from "hogging down" the crop is more than saved in the ex-pense of gathering and feeding the crop—to say nothing of the increased fertility of the soil gained by this method of feeding. Care should be ex-ercised when first turning hogs in a field of corn. They should have a pre-liminary feeding of old corn and a proper amount of protein supplement to prevent them from gorging them-selves and starting digestive troubles. The herd should have a supplemental feed of tankage, oil meal or shipstuff while hogging down the corn to bal-ance the corn ration. Some farmers plant soy beans with the corn and this helps to balance the ration and saves labor in feeding. (Write to the Ani-mal Husbandry Department or to the Agricultural Extension Service for fuller information in regard to rations, forage crops for hogs and feeding methods).

(Continued in next issue)

Missouri farmers lose more money every year from hog cholera than the total appropriations of our state gov-ernment and this loss can all be saved by following Dr. Connaway's advice.—Editor.

Cover Trash When Plowing

Oliver No. 63 Engine Gang

You are having more trouble covering trash this year than you have for a decade. You know the importance of having all green vegetation and trash on the bottom of the furrow. The growth of your fall crops depends on how well you cover trash.

We have a trash coverer which covers rank growths on your stubble. The Oliver No. 62 engine gang has it. This simple engine plow does better work than you can do with horses and has all adjust-ments operated by the man on the engine. In all plowing demonstra-tions given this year the Oliver No. 62 Gang did work that was in a class by itself.

We want to tell you about this plow and show you why it will cover your trash better than any other plow.

ASK ANY OLIVER DEALER ABOUT IT.

WRITE US FOR FULL PARTICULARS.

Plowmakers for the World

St. Louis, Mo. Kansas City, Mo.

THE GARDNER LAND BANK LAW

While in former issues of THE MISSOURI FARMER the Managing Editor has already thoroughly and ably discussed the proposed Gardner Land Bank Law, yet of such transcending importance is this act—the greatest ever passed by a Legislature in the history of this state in the interest of the farmer—that perhaps a renewal of the discussion may not be out of place at this time. From time out of mind the farmer has had to pay excessive interest rates and that, too, upon the soundest and best collateral in the World. Not only have the interest rates within themselves been exhorbitant—leaving little opportunity for a margin of profit in the operations for which the money was used—but the short periods for which the farmer has been able to borrow and the embarrassment and annoyance attending the frequent renewal of these short time loans has hardly made the "game worth the candle." The American farm game is no longer a two by four affair. It is the great fundamental industry of the Nation, involving the production of billions of dollars worth of new wealth every year—and the time has come when, if American Agriculture is to make the most of its opportunities and if it is to become the great bulwark of the Country's future prosperity and well-being that it deserves to be, the farmer must be rescued from borrowing facilities which place him in a class little removed from those whose misfortunes drive them to a pawn shop. With collateral based upon his land, he surely has a right to expect to borrow under as favorable conditions as any other class or interest—and so too, it should be made possible for him to extend the duration of his loan over a period of years sufficiently long to enable him to develop his farm into a money-making enterprise—a thing which is impossible under a hand to mouth borrowing system which ignores the years of time necessary to building up his soil, live stock and other farming equipment.

Will Help Young Farmers

As matters stand, at least in a majority of cases, the farmers who are well to do today derived their wealth from increased land values rather than from the profits they made out of growing crops and live stock—and while such farmers may manage to get along with comparative comfort under existing conditions, yet to the young farmer with little capital save muscle and determination the prospect of owning a good farm of his own, at the present prices of farm lands, look dreary and disheartening—and it is to such men, as well as the average farmer who is struggling along under a heavy mortgage upon which he is paying an excessive rate of interest that the proposed Land Bank Law offers a new hope and a brighter prospect in the years to come.

In a nut shell, the new law provides for the creation of an institution which is to be known as the **"Missouri Land Bank"** which shall become a part of the State Banking Department and be under the management of the State Bank Commissioner at Jefferson City. This bank shall have the power to make loans direct to the farmers of this state, on promissory notes, secured by deeds of trust in the nature of mortgages on farm lands, of amounts not in excess of 50% of the appraised value of the land—pledged to run for periods of not less than five years nor more than 25 years. No loan shall be less than for the sum of $250 nor for a greater sum than $10,000—preference being given to the smaller loans. Loans will be made only to applicants who offer first liens on perfect titles and in no case shall the loan be used for speculative purposes. To this end it is stipulated that these funds can be used only for the following purposes:

1. To increase the production of the land mortgaged.
2. To make useful improvements thereon.
3. To pay off liens or incumbrances, or to make part payment of the purchase price where the borrower is paying part of the purchase money.
4. Twenty-five per cent of the amount borrowed may be used for the purchase of livestock and machinery.

A Million Dollars Capital

The act provides that the General Assembly shall appropriate one million dollars as working capital for the said Missouri Land Bank and that the first $500,000 shall be loaned to farmers at 4.3%. In addition to this, the State is authorized to collect one-half of one per cent from the borrower to pay the expenses of conducting the bank, etc. Against the notes of the borrowers the bank will be authorized to sell and issue debenture bonds and these bonds will recite on their face the fact that they are secured by notes for the amounts thereof, secured by deed of trust on farm lands in the State of Missouri to the amount of twice their face value. In other words, the Land Bank will, from time to time, offer a series of these debenture bonds for sale to the investing public and inasmuch as the bonds will be secured by land worth double the face value—and since these bonds will be exempt from state, county and municipal taxes of any kind it can readily be seen that they will at once become a most desirable and sought after investment in the money markets of the Country.

While the loans will run for from five to twenty-five years, the borrower has the right to pay all or any part of his loan at any interest period after the first five years. Thus, suppose a farmer borrowed $1000 on the amortization plan: If he sought to pay it off within five years, it would require an annual payment of $224; in ten years, an annual payment of $124; in 15 years an annual payment of $91; in 20 years, an annual payment of $75; in 25 years, an annual payment of $65. If the bank finds that it has not needed all of the one-half of one per cent interest charged borrowers to pay the losses and expenses of the bank, then it shall have the discretionary power to refund any proportionate surplus to all borrowers whose loans have run for a period of at least ten years—thus exacting from borrowers only such an amount as is necessary to keep the institution upon a self-sustaining basis.

On a Sound Basis

In short, the Land Bank Law means that henceforth farm credits will be assembled and placed upon a sound basis the same as city or government bonds, and will therefore command the lowest current interest rates.

These, in brief, are the provisions of the new law and that its enactment is of tremendous importance to the farmers of Missouri there is little question. Before it can become a law, however, a Constitutional Amendment will have to be submitted and receive the approval of a majority of the voters of the state at the next general election in 1916.

In the near future, the petitions for the necessary Constitutional Amendment will have been prepared and the moment they are ready announcement of the fact will be made in our columns and THE MISSOURI FARMER will then be glad to send copies of the blank petitions to any farmer who will agree to circulate them for signatures in his community. It goes without saying that every farmer in the state should sign one of these petitions—not that such a large number are legally necessary but if for no other reason, for the moral effect it will have upon the voters in the towns and cities.

Farmers Get Busy

In the campaign of 1912 when a group of agitators sought to fasten the iniquitous Single Tax upon the land owners of this state, THE MISSOURI FARMER was the first publication of any consequence to raise its voice against this dangerous propaganda which would have weighed like a "mill stone" upon the necks of the farmers of Missouri—and even as it led the fight against that heresy, so today it wishes to impress upon its friends that the Land Bank Bill means more to them than any other piece of legislation ever written upon our statute books and that no legitimate effort should be spared to guarantee a safe majority for the necessary constitutional amendment at the forthcoming election. Naturally, the first step that should be taken is to line up the farmers themselves solidly for the measure—and to this end, we suggest the organization of a "Land Bank Club" in just as nearly as possible every school district in the state and to those of our readers who are willing to lead out in forming such an organization within their districts we suggest to write to us at once when we will gladly render them every assistance possible. If you wish extra copies of this issue for the benefit of your neighbors who are not now receiving the paper, let us know, when we will supply you as long as our surplus copies last.

Should Organize Now

We do not at this time look for any organized opposition to the Land Bank Bill but certainly the issue involved is of such overwhelming importance to the farmers of this state that they cannot afford to take any chances—and safety lies only in thorough, state-wide organization. No one knows at this time what other amendments may be submitted and there is always the danger of some "red flag" proposal which will move thousands of voters in blindly voting against all amendments in the hope of killing the one to which they are chiefly opposed. If, therefore, somebody asks you to sign a petition for some kind of an amendment, be on your guard—and unless it is of genuine public importance and unless you are certain that you understand the motive behind it it will be better to have nothing to do with it.

Once farmers themselves have been thoroughly organized the educational campaign must be carried into the towns and cities—for one man's vote counts just as much as anothers. When business men and laboring men come to fully understand the proposed measure thousands of them will favor it heartily for it is to the interest of all our people that the farmer shall have the broadest possible opportunity in working out his destiny. But for the present let us see to it that the farmers of just as nearly as possible every school district in the that are thoroughly aroused to the importance of this measure and we want every reader of THE MISSOURI FARMER to know that he is at liberty to call upon us for assistance to this end.

William Hirth.

International Harvester Wagons—Weber—Columbus

WHEN your old wagon is just about gone and you're thinking of buying a new one, sit down and do a little figuring. What kind of service has that wagon given you? How many delays have you had because of accident and breakdowns? Could you always get repairs easily? How long has it lasted? You have to add all unnecessary expense to the price you paid at first, to find out what your wagon really cost you.

When you have these figures you will see at once the advantage of buying a **Columbus** or **Weber** wagon. They give you steady service, with no delays. You can get repairs any day you need them. The folding endgate and link end rods make them easy to load and unload. The fifth wheel—an exclusive feature on these wagons—adds years to their life.

When you are ready to buy a new wagon and want the one that costs the least per year of service, drop us a line. We will direct you to the nearest **Columbus** or **Weber** wagon dealer and give you information that will make it easy for you to buy one of the best wagons you ever owned.

WE WANT YOUR HELP

THE MISSOURI FARMER is offering to pay the expenses of some ambitious farmer boy through the "Farmers' Short Course" at the Agricultural College this winter—and we want the

interest and help of every reader of the paper in this good enterprise. The "Short Course" lasts for seven weeks. The first course begins in November and the second one in January—and boys will have the choice of attending whichever term they prefer. This means seven weeks instruction in Missouri's great Agricultural College in Soil Fertility, Live Stock Feeding, Breeding and Diseases, Seed Selection, Seed-bed Preparation, Dairying, Horticulture and the other great fundamentals of Agriculture—a training which your boy will be able to put into mighty profitable practice on your farm next year. Again, mingling with 3000 of the brightest boys and girls from all over Missouri for seven weeks will do any boy a lot of good. Any bright boy can win this prize with his spare time during the next 30 days. If there isn't a boy in your family who would appreciate this opportunity, please mention it to some bright boy in your neighborhood and have him write us for full particulars at once.

HOW HE LOOKS AT THINGS

The following letter from Mr. C. H. Jackson, one of our good readers at La Plata, has some good suggestions in it. Along with his letter Mr. Jackson sends a group of kodak pictures which show a well kept farm with lots of fine live stock—the kind of a farm which shows thought and thrift and no doubt happiness in the family circle.

Editor The Missouri Farmer:

Often as I have read your paper I have thought of writing you a letter—and then again I wonder whether anything I could say would prove of interest to your readers. I can see that the man who writes the articles on the first page isn't in favor of a big Army and Navy and I want to heartily approve this sentiment. So too, we want to keep out of this awful foreign war. Let us attend to our own business and sell them our surplus wheat, pork and beef, so we can help to keep body and soul together for those who haven't as yet been killed on fields of battle. We need to think of how to farm and manufacture better rather than of war. We have too many idle men in the Country who ought to be at work—too many boys in our towns who hang around pool halls, which are places of iniquity that have ruined thousands of young men. Too many men standing around on street corners wearing a "biled" shirt, chewing tobacco and telling nasty stories while their wives eke out a miserable existence—and yet when we farmers need a man in the harvest field or behind the plow these street loafers turn up their noses at us. Some of these fellows who want war might organize these fellows into an army for it really wouldn't hurt much if a lot of them never came back home again. Missouri is so rich in agricultural, mining and other possibilities that no able bodied man should have an excuse to be idle. What we need is more thrift and education—and whether you like him or not, no man has done more in recent years to "jolt things up" in wholesome fashion than has our old friend William J. Bryan. When he found that he couldn't agree with the President he got out and gave him a chance to put another man in his place and I honor him for it. This has been a hard season on us farmers around La Plata—entirely too much rain just as it was too dry the two years before. And yet we must make the best of it for it doesn't do any good to grumble. I am sending a dollar to renew your good paper because I think it should have a place in the home of every good farmer in Missouri. With best wishes,

C. H. Jackson, La Plata, Mo.

A MODERN COUNTRY CHURCH

On August 15 the farmers who live in the vicinity of Ashland Church in Howard County, Missouri, dedicated a new structure which is a splendid monument to the progressive spirit of these good people and which deserves emulation in many other Missouri communities. To Mrs. Pearle Henderson Pipes we are indebted for the following description of the new edifice: "This splendid new structure will long stand as a monument to the enterprise and zeal of the people of Ashland community. It is a handsome brown brick building with stone trimmings and would do credit to many town congregations. It has a fine auditorium, a choir loft so arranged that a pipe organ can be installed later, a pastor's study, baptistry, toilet rooms, cloak room, rest and Sunday school rooms—and in the basement a commodious kitchen, dining room and heating plant. It is lighted by gas and equipped with a waterworks system—and as an evidence of the progressiveness of the farmers of this community, the big dining room will be utilized for high school purposes."

Why will not hundreds of other fine Missouri farming communities follow this example and build a country church in their midst which will be a real power for good? Not only is Ashland Church in position to become a powerful influence in a spiritual sense but here is a building so equipped that it can become the center of all wholesome community interest. Here the farmers in the surrounding territory may gather with their families not only to hear a good sermon but also for pure enjoyment and recreation. Here the young folks may have their rendezvous of fun and entertainment and here in this comfortable dining room in the winter time the farmers may come together to talk over their different problems and listen to agricultural lecturers. Truly the farmers of this community are on the right track and those who follow in their footsteps will find farm life more interesting and have less difficulty in keeping the young folks content with rural conditions.

LYON'S PRACTICAL FARM PAPERS

Our chautauqua audience of more than 1000 persons was highly pleased with Dr. Luckey's lecture on tuberculosis and the interest in it was so great that not a single person left while the doctor was speaking.

Silo building is on here now, and one firm says that they have thirty silos under contract.

Our son, Wayne, of Hickman Mills, Mo., is at home, and says that he is going to put up a 14-30 yellow pine flooring silo, as soon as he gets home, or about Sept. 1. He says that he only has a two-year lease of the farm he is on, or he would build a standard silo, but that the cheap flooring silo will, if well put up and cared for, last seven to ten years.

At this date, August 20, we are having cold wet weather, too cold in fact for corn to do its best, but our corn is all early enough to make a good crop and mature before frost.

Tobacco has made a wonderful growth in the past two weeks, and a week of warm weather will see early tobacco going into the barns, my own crop being in this class.

There is very little breaking for wheat being done this year, the intention being to sow the main part of the crop in standing corn, or in corn stubble after the crop is cut and shocked.

Farmers are complaining about the fact of not being able to get a fertilizer containing more than one or two per cent of potash, and many of them will not buy any at all. I consider this to be a great mistake, and will use a 10-2 at the rate of 125 pounds per acre, unless I am able to pull through a prospective deal for a ton or two of 3-24 dissolved bone that I have in view. In that case I will mix the 10-2 and 3-24 half and half, and use at the rate of 125 pounds per acre.

If I could get nothing but a 12 or 14 per cent acid phosphate I would use that at the same rate or possibly a little higher, as I have had excellent results from a plain acid phosphate.

Early potatoes are all dug and under cover. We planted two bushels of Early Ohio and after using from them from early June to late August 65 bushels of very large potatoes were gathered.

The apple crop is immense and the quality fine. Many people have hundreds of bushels of fine fall apples with no sale for them, and would make them into vinegar but for a fool law we have that prohibits the sale of any except inspected vinegar, and a farmer is not going to bother about having a barrel or so of vinegar inspected, so that only enough for home use will be made.

The Sudan grass is ripening its seed, just about 70 days from date of seeding, and I like the appearance of the plant better than any of the sorghum or millet I have seen.

I hope that every reader of The Missouri Farmer will try a pound or two of the seed next spring, as I think the seed will sell cheap—10-15 cents per pound—and I feel sure that it will prove a valuable crop in many places. Still it can never take the place of alfalfa, clover, soy beans or cowpeas.

C. D. Lyon.

Clover With Rye

I notice in your farm journal of June 15, on page 12, an article headed "Rye for Winter Pasture." It states that Mr. Gartin has not had a clover failure on his rotation field since starting the work. It states that this last fall he sowed clover in with his rye. I would like for you to give me this information: At what time did he sow the rye and was the clover sown in with the rye? Yours truly,

L. F. Leyhe, Saline County.

The plan in handling rye for winter pasture on the Gartin farm is to follow oats with the rye. As soon as the oats are off, the ground is plowed and rye is seeded. This makes early seeding of the rye and hence under normal conditions good fall pasture. As soon as the rye has made a good start, the clover is sown and lightly harrowed in. This will probably make clover sowing come around the latter part of August or fore part of September. Last winter was quite a severe winter and the clover came through in excellent shape this spring. I have not seen it since.

The rotation used on this farm is corn and soybeans the first year, the second year oats, the third year rye, and the fourth year, clover.

D. H. Doane.

Please look at the yellow label on your paper and if the time is out $1 will renew for three years.

Get a Square Deal When You Buy Fence

Be Square With Yourself When You Buy FENCING

You can't afford to put up a short-lived fence. You can't afford to make the mistake of buying any wire fence on "price" alone. Look out for light, imperfect, brittle wire; thin uneven galvanizing; weak, flimsy, half-tied knots, and out-of-date, clumsily woven, hard-to-put-up fencing. Buy the fence you **KNOW** you can depend on—one that will stand up tight and trim the whole year 'round—one that will give and take with sudden strains and season's changes—one that will last more years, cost less for repairs, require fewer fence posts, turn all kind of stock better, hold its shape and resist rust longest—in short give you the **most for your money in real fence service and satisfaction. See**

SQUARE DEAL FENCE

before you buy. See the famous **SQUARE DEAL LOCK**—the double grip that will not slip. See the one piece stay wires, the wavy, springy, strand wires, the perfect weaving, the heavy, even galvanizing, the strong, flexible quality of **square deal wire** made in our own mills, not bought in the open market.

FREE! If you want a **Square Deal** in farm fencing write our factory direct today. We will send land owners Free and postpaid our latest catalog and price-list, also a full-size copy (50c edition) of Ropp's Lightning Calculator (if you have not already sent for one before)—160 pages of the greatest money, time and labor-saving ideas ever published. All **FREE.** Write today.

THE MISSOURI FARMER

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

Vol. VII September 1, 1915 No. 17

William Hirth - - - Publisher
Geo. B. Ellis - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year in Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct, always inclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

THE ROADS

Not for a great many years have we had a season in Missouri that so thoroughly tested the quality of the work done on the roads as this season has done. If we allow the roads to go into the winter season rough and full of holes and ruts we are in for a siege of impassible roads next spring. No road should be torn up with plow and grader at this time of year because there is not time for the road bed to pack before freezing weather, but if the drag is used often to fill up the ruts and holes and give the water a chance to run off into the side ditches rather than soak into the road bed we will have very much better roads during the winter. It has been raining so frequently this summer that it may seem like a lot of time wasted to drag the roads after every rain or wet spell but the road that is kept up with the drag now will be so much better all winter and will take less work next year that the extra labor now will pay big. It matters not whether a farmer owns a jolt wagon or an automobile he will get full value received for dragging the road he travels frequently—the road beside his own farm.

LOOK OUT FOR NEXT YEAR'S SEED CORN

A number of light frosts have already been reported in some of the northern Corn Belt states and with the excessive amount of moisture in the ground it is not unreasonable to expect killing frosts on or before the average date which is about October 15 for central Missouri. Much of the corn is late this year, in fact the earliest will be very slow in maturing and drying out so it will be safe from injury from an early freeze. This condition makes it important that every corn raiser look out for next year's seed corn as soon as the first corn is mature enough to gather. Corn for seed ought to be fully ripe and dry before it is gathered, but if there is any danger of freezing corn that is well past the roasting-ear stage but still full of sap may be gathered from the field and put in a warm garret room in the house and it will dry out and make good seed. The thing to look out for is to gather the seed and put it in the dry before it has a chance to be injured by freezing. After corn is thoroughly dry it takes very hard freezing to injure, but before it dries out it takes very little freezing to destroy its vitality.

Another caution we would make is that the green corn when gathered from the field should never be put into sacks or boxes or even piled on the floor. Corn thus stored unless very dry will mold and the germination will be greatly injured. When seed corn is gathered from the field it should be placed in some of the various kinds of seed corn racks or else tied up in strings of ten to twelve ears and swung to a nail in the overhead loft and the ears should be so placed or tied that no ear touches another.

No corn grower can raise a good crop without good seed and the time to be sure of good seed is before the first freeze comes this fall.

STATE FAIR DAIRY SHOW

The state dairy commissioner, E. G. Bennett, is making a commendable effort to get out a fine exhibit of dairy cows at the Missouri State Fair to be held at Sedalia, September 25 to October 2. Breeders of dairy cattle, creameries and all others interested in the development of the resources of Missouri should earnestly co-operate with our state dairy department to make this dairy show a success. Commissioner Bennett very forcibly says:

"The high prices that have been paid for desirable dairy cattle within the past two years, should arouse the interest of every farmer in Missouri—they prove conclusively that it is worth while to improve the breeding of the dairy herd, and it also proves the importance of giving cows authenticated tests of merit. Highly producing cows that are well bred, bring prices beyond their productive worth, because of their value as breeding animals. Offspring from such cows bring high prices because they come from cows that have proven their worth. The blood of highly productive dairy cattle is always in demand, and always will be. Therefore, in buying young stock, it is well to know they come from ancestry having authenticated or official records. Better breeding, better care, and more feed, will increase the production of our average cow at very little increased cost. Dairy products are much higher than they were twelve or fifteen years ago. True, most everything that has to do with the keeping of cows has increased in price also—but not to the extent that dairy products have, and we cannot hope for them to go much higher. The one hope for making more money in milking cows seems to be in an increased production—and when we consider the average cow produces less than 150 pounds of butterfat per year, while the champion cow produced 1176 pounds of butterfat in a year, materially increasing the produce of the average cow seems well within the range of possibilities. Believing that a practical demonstration, showing that some cows pay their owners a profit, while other are kept at a loss, would prove instructive and interesting, the State Dairy Department will have a demonstrating herd on exhibition at the State Fair; strict account will be kept of the feed consumed and of the milk produced each day of the Fair, and the loss or gain shown, with instructive comments by competent persons."

The creameries of Missouri are showing a commendable interest in the development of dairy stock by authorizing the announcement that they will give five hundred dollars cash to be contested for in a 7-day butterfat contest.

Every day during the Fair there will be conducted in the big dairy tent a dairymen's meeting to be addressed by such well-known speakers as Professors Eckles and Brandt of the agricultural college, Messrs. Lewis, Jordan, Wright, Luckey, McKee and Mayes of the board of agriculture, besides other authorities of reputation.

Meetings will be held during the week of the State Dairy Association, Southwest Jersey Cattle Breeders' Association, State Holstein-Friesian Breeders' Association, State Creamerymen's Association and a meeting of cream buyers. If you are interest in any branch of the dairy business, better attend these State Fair meetings.

ARE WE HELPING YOU?

The other day one of our subscription solicitors wrote in and said: "Ordinarily I have very little trouble in renewing the subscriptions of farmers who have been reading the paper for a year or two. The moment I make my mission known the most of them say, "Certainly I want to keep on getting The Missouri Farmer. I wouldn't do without it for several times the price because it's clean, strong and reliable and because it is the only **real** Missouri farm paper in the state." In varying degrees these are the sentiments these men express—and I think we can safely say that in most neighborhoods we have the really thinking, progressive farmers on our list. At least this is true wherever I have canvassed so far. Once in a while, however, I strike a farmer who tells me that he "hasn't got time to read farm papers"—and as a rule it does little good to argue with farmers of this kind for you soon realize that, no matter how good a paper might be, they have never formed the habit of careful reading and thinking"—and we believe that this solicitor, although unconsciously perhaps, has stated the line which separates the farmer who is seriously trying to better his condition from the one who is just drifting along aimlessly in the old rut.

We are glad, however, that we have so many of the first class of farmers on our list—those who, while they may be in humble circumstances today, are trying to win—who are fighting to pay off the last dollar of the mortgage and who, in the not distant future, hope to be able to live in a better farm home with big red barns and better flocks and herds filling the barnyard, feed lots and pastures—for this is the type of farmer upon whom a more efficient American Agriculture and a higher rural citizenship must depend in the years to come. It is to this class of farmers that The Missouri Farmer is striving to be of genuine service—for no farm paper, however ably edited, can help the farmer who refuses to read and think. To such farmers we are trying to give infomation which will help them solve the many difficult problems they are facing in their every-day farming operations—information which will give them more to show for their sweat and toil at the end of the year. Surely in this great commonwealth there is room for one **real** Missouri farm paper which is owned and edited within the state by men whose heart and soul is in the thing they are striving to accomplish and who understand intimately the problems with which Missouri farmers have to deal! In order to do this successfully, however, we need good friends in every school district. The paper is still young and merely the promise of what we hope to make it during the next two or three years. What we need above all else is friends who will help us build up the great and splendid publication we have in mind—men who think enough of the paper to go to those of their neighbors who are not now receiving it and ask them to give them 50c for a year's trial subscription. To this end, we are going to make a **personal** appeal to every **real** friend of the paper to make a serious effort to send us a half dozen new subscriptions during the next 30 days. If you are willing to give us this help, drop me a postal card when I will send you some sample copies and leaflets explaining the Land Bank Bill—and I will also send you a little remembrance for the half dozen subscriptions which I am sure you will prize very highly.

William Hirth, Publisher,
THE MISSOURI FARMER.

FREE TEXT BOOKS FOR PUBLIC SCHOOLS

This is close to the date for several thousand schools to open their doors and begin their year's work and we wonder how many children will enter school the first day without the necessary books. We have a law in this state that permits districts to furnish free text books but only a very small percentage of the districts have made this progressive step in education. The same spirit which once opposed the free public school now opposes free text books because they are just constitutionally opposed to the state doing anything for the individual that the individual can do for himself although the state might do it ever so much better.

A circuit judge of one of the districts of North Missouri is quoted as saying before a meeting of a county school board the other day that:

"When you ask the Government to do something for the citizen that he ought to do for himself, and be proud of the opportunity, you create an enfeebled citizenship.

"The men who fought and won the Revolution asked no odds of any man, but relied solely upon their good right arms to wrest this country from tyranny. All they sought of the Government was the right to life, liberty and the pursuit of happiness. They did not ask alms; they would have refused them."

This spirit exhibits both prejudice and ignorance. Prejudice, because the maintenance of the school itself is no more paternalistic than furnishing the books. Ignorance, because any one who has investigated the benefits of free text books knows that the schools are much more efficient and particularly is this true in congested districts where there are more poor children. It is the poor child who needs a school training more than the well-to-do and the statistics show that there is a larger and more regular attendance where free books are furnished.

Ignorance dies hard, but it will die just the same under our free public schools and free text books. Last year 130,541 pupils were furnished free books out of a total of 706,364 enrolled in the schools and if all the districts had furnished free books there would doubtless have been several thousand more in school. Who would withhold the small sum of 87 cents, the cost of books for a child, and have it grow up in ignorance?

BUCKSHOT BY THE PROFESSOR

If I lived in Galveston, Texas, I'd live somewhere else.

I hate to see enough rain wasted in one year to insure good crops for twenty.

I don't own an automobile because I haven't got the nerve to "honk" at my banker—and if I didn't "honk" at him I might run over him.

You still find a lot of old timers who know a whole lot more about raising a patch of mint than they do about raising a patch of alfalfa.

Anyway I think we are going to have an honest state capitol building in this state—and talking of new capitol buildings, that will be "going some."

I've been having a touch of rheumatism and I don't know whether its due to the wet weather or the fact that Congress will soon be in session again.

I wish there was some way to harness up the power that is wasted in "chawin' terbacker" and "whittlin'" dry goods boxes. I'd have that Keokuk power dam skinned a mile.

Referring to the recent recipe I gave for killing fleas, a fellow wrote in the other day and said, "Referrin' to the proper way fer to kill a flea, I think that Professer feller is a fule."

There are a pile of men in this world who laugh and shout and are hail-fellow well met with their friends—and mean and sour and snarling to their wives and children at home.

Whenever I look out of the window at the lowering clouds I think of the conditions which prevail over in the red fields of Belgium, France and Poland—and then I am thankful that I live in a land of peace even if it does rain an inch and three-quarters every day.

I sometimes think the Church would be more powerful for good if so many preachers didn't keep their ears glued to the grass roots—listening for a "call" to where the grass is just a little bit greener. Dollars and the "old-time religion" never did mix up together very well.

If I had my way about it I'd put every pool hall in the Country out of business because they are places in which thousands of boys are started on a path that leads to crime and ruin.

About the only thing that I've seen—it seems to me for weeks—that bore any resemblance to sunshine or moonlight were the noses of some of my old friends who belong to the "Personal Liberty League."

Say Neighbor, what are you getting out of life anyway? Are you putting thought and real effort behind your work? Are you really trying to get ahead? Are you trying to do your tasks a little more thoroughly today than yesterday? Do you regard life as a real opportunity—or are you just drifting with the current in an aimless fashion? If so, wake up! Resolve that for the remaining days which God gives you you will give to Him, to your loved ones and to society the best that's in you—and then when the great clock strikes your neighbors will have to admit that your community is better off for your having lived in it. Life, my friend, is opporunity.

The Missouri Farmer has an easy plan by which some bright farmer boy from every community may attend the "Farmers' Short Course" at Missouri's great Agricultural College this winter. By utilizing his spare time during the next two months any ambitious farmer boy can easily win this splendid prize which means that his board and lodging will be paid and his text books furnished free during this fine seven weeks course. If there isn't a boy in your family who cares to take advantage of this opportunity, why not mention it to some other deserving boy in your neighborhood?

A YOUNG FARMER LOOKING AHEAD

No young man can afford to overlook the value of good training if he hopes to succeed on the farm. A well regulated farm is a pretty good place to get most of that training but it is impossible to get all of it there. Any way a boy may get more valuable information that he can use on the farm by attending the seven weeks short course in the agricultural college than he would get in as many years on one isolated farm. There is so much to know about farming and live stock production now-a-days that it is a pretty good plan to supplement all we can get from the home farm and from reading good books and the best farm papers with a course in the agricultural college.

The Missouri Farmer is making this possible for any intelligent farm boy who recognizes the need for more knowledge to use on the farm. As an example of the intelligent way in which this question is viewed by many young farmers we publish the following letter from a young farmer from Shelby county:

The Missouri Farmer: I have just read about the chance for farmer boys in your paper and am answering at once. I am very anxious to get an education and to specialize in agriculture.

I am a farmer boy and would not have answered the article except that you stated you wanted the spare time I have.

This is a busy season for me just now finishing harvesting and a great deal of plowing to do, but I am interested in your proposition. Please send me information as to how I may earn my way through the short course. I graduated from Clarence High School last spring and have been helping my father on the farm since. I expect to follow in my father's footsteps on the farm, but want to be prepared to do so. E. D. Muhleman.

A CHANGE RESPECTING OUR ROAD SYSTEM

Dear Editor: No proposition is of greater importance than that of good roads. Not only is this true as to the farmer but men of all professions. People living in towns as well as in rural districts should be interested in having good roads.

But the question is how are we to solve the road proposition? After all that has been said it remains as yet for some plan to be devised to have good roads. The present road system is a practical failure. It is impossible to make something out of nothing. The main thing is that land owners along the public highways agree to give enough land to widen the roads from 40 to 60 feet as the road engineer might determine. It requires greater width for roads in a broken country than it does in a level country. Under the present system many of the roads are so narrow, especially in the broken districts there is not room enough for autos and other private conveyances to pass each other. But the greatest difficulty is on many of the roads great ditches are washed on either side and the roads so narrow it is actually dangerous to pass over them. The road proposition may be discussed until 'doom's day' and it will amount to nothing more than hot air if land owners are not willing to give enough land to widen these narrow roads and thus enable road workers to fill those ditches. It is absolutely impossible to grade roads where there is no dirt to grade. The question is, will the people recommend legislation to widen the roads? In my judgment this should be the paramount issue.

The next important thing is, there should be road engineers to permanently establish the width of roads and to supervise culverts, etc. If the people agree to these changes it will be an easy matter to adjust other things pertaining to good roads. What sayeth others? C. C. Turner.

Browns Station, Mo.

Editorial Comment: The above letter from Judge Turner of Boone County, who has for many years been one of the foremost advocates for better roads, emphasizes the absolute necessity for public opinion to be back of any law on the statute book. The present road law was written with a view of giving a good engineer to every county who could plan and supervise the building of culverts and bridges and furnish advice in the laying out of roads, etc. We have seen miles of roads, such as are described by Judge Turner, too narrow in places for two vehicles to pass in safety and along the fence row a strip of briars and bushes covering a rod or more in width and the landowner too close to give a few feet of ground to widen the road.

Any community in this state can have good roads if the people are practically unanimous for the improvement and we will not have good roads until they are. This is a live subject and we would like to have our readers write us their views on what is needed in their respective neighborhoods to bring about better roads. A discussion of this subject by the farmers ought to result in a better sentiment and better roads also. Let us hear from you and we will publish your suggestions for the benefit of others who may not yet be so enthusiastic about it as you are.

THE GRANGE

What is the Grange? What does it stand for? Actually, we are sometimes asked these questions! Why is it that people who are well read upon the doings of our country do not know of the Grange? Is it because the farmer has less interest in the former than any other class of people? Oh, no! But some have said "the farmers are still sleeping and not being ready to wake up we must let them sleep a little longer."

But listen, ye sleepers, the Grange is moving on, rapidly moving, and if you wish to be left in the rear, why sleep on!

More granges are being organized all the time and splendid work being done with a promise of more and better work and better farms and happier homes by the organized farmer.

As a useful fraternal organization the Grange can well lay claim to superiority. Most organizations of this kind limit their activities to the things that benefit their members, but the Grange aims not only to do these things but to promote the agricultural interests of the country besides. While primarily the granges themselves may gain through better farming conditions, the product of the soil is the basis of all wealth and prosperity so it is essential to all that the land be made productive; the only means at hand to do this is the farmer. It can be truly said, "Take care of the farms and the cities will take care of themselves.

Some splendid field meetings are being held throughout the summer months. These public meetings besides affording much pleasure to the members enable the grange to give the outsider in each district an insight into the principles and work of the farmers' official organization of the country. And the large gatherings at each meeting attest to the growing interest.

And as a compliment to the Grange it is true that no matter how dire the predictions of the Sleepers may be, the Grange keeps moving right along just the same. So farmers, be a live wire, wake up, get together, organize, co-operate and let your motto be: "Something for the good of our community this year." It is worth the try.

State Grange Secretary.

Boys and Girls Winning Prizes

Boys and girls won $70 in the judging and sewing contests held by the first agricultural demonstration school from the University of Missouri during the Knox County Fair at Knox City, Missouri, August 10 to 13. A 20x40 foot tent filled with all kinds of exhibit material well displayed in uniform cases with three men to conduct the contests and give lectures and demonstrations composed a school that was an out standing feature of interest at the fair.

Judging contests for the boys in corn and livestock were conducted by Mr. L. L. Childers and Mr. S. T. Simpson. Each contest was preceded by a practice exercise which instructed the boys as to what was expected in the contests. The boys were prompt in reporting and showed a keen interest in all the work. They were also free to express that they felt they had learned a great deal. The prizes awarded were $2.50 for 1st, $2. for 2nd, $1.50 for 3rd and $1 for 4th place. The two boys who scored the highest number of points in both contests were awarded $10 each for a trip to Columbia Farmers' Week.

The girls had contests in patching and buttonhole making. These contests were conducted by T. W. Reavis and an assistant. The girls had a practice before each contest and the work displayed by them showed many of them to be real artists with a needle. They reported for their contests promptly and seemed to enjoy the work thoroughly. The prizes were the same as for the boys including the two trips to Columbia.

The exhibit in the tent comprised the most complete and best arranged material ever sent out from the University. Hundrdes of people found time to view the exhibit.

Lectures on alfalfa and hog cholera were delivered to the men while the women were interested in home canning demonstrations. The men in charge were asked numberless questions which showed the people were interested in the work.

F. E. Longmire, County Agent,
U. S. Dept. of Agriculture.

2-Cylinder Cushman Engines

Very Steady Power

8 H. P. 2-Cylinder Weight Only 320 lbs.

For all farm work. 8H P. weighs only 320 lbs.; for silo filling, grinding, sawing, shelling and all light work. 15 H P. is a splendid size where only 1 engine is to be used. It will handle most all farm work, light or heavy. Equipped with Schebler Carburetor and Friction Clutch Pulley.

20 H. P for heavy work, weighs only 1200 lbs. Equipped with gear-driven high tension Magneto and Clutch Pulley. Cushman Engines are **not cheap engines**, but they are **cheap in the long run.** Cooled by circulating water system, pump driven. Sizes 4 to 20 H. P.

4 H. P. Handy Truck Weight Complete 375 lbs.

Cushman Motor Works

827 North 21st St., Lincoln, Nebr.

Try This KRAMER ROTARY HARROW ON 10 DAYS FREE TRIAL

No Money Down

FREIGHT PAID

Harrow and Plow at the same time. Hitch a **Kramer Rotary Harrow Attachment** behind your plow. Can be attached to any sulky, gang or steam plow. Light draft. No extra horses needed. Pulverizes and levels the ground in one operation. Preserves the moisture in the earth—more than pays for itself in increased crops, time and labor saved. Satisfaction guaranteed. Write today for Free Illustrated Fo'der and our Freight Paid 10 Day FREE Trial Offer.

KRAMER ROTARY HARROW CO.
145 Main Street, MORTON, ILL.

Going to "Frisco?"

The Missouri Farmer is offering to send any bright farmer girl to the great Panama Exposition at San Francisco—that is, for a small number of new subscriptions to the paper which she can easily get in two or three weeks' time in any good farming community we will pay her round trip Railroad and Pullman fare. Already quite a number of girls have won this fine trip. We want to send a whole Pullman car full sometime in October. In this way, where a lot of fine girls go together their parents will know they are safe—for they will go and come in the same car and will stay together while in San Francisco. Think of what a fine chance this is to see the "Golden West" with its snow-capped mountains, the "Wonderland" of California and the great Exposition which is conceded to be the greatest show of its kind ever held in the World. We will be able to accommodate 40 girls in the big Pullman car which we expect to send in October—and two weeks hustling will enable any girl to win. There is no time to lose and those who want to win this splendid free trip should get in touch with us as once. With your round trip Railroad and Pullman fare paid, a few dollars will pay the balance of your expenses—and we even provide a way by which you can do this before you start. So write us today if you want to go.

Beautiful Photograph Free!

If you will send us two new yearly subscriptions to The Missouri Farmer at 50c each and a photograph of some loved member of your family we will send you free for your trouble a beautiful enlarged picture 13x17 inches in size. This is not cheap work but a picture of the very highest excellence and one which would cost you several dollars if you attempted to buy it in any other way. Just ask a couple of you neighbors to give you 50c each for a year's subscription and send us the photograph. We will guarantee to surprise you with the beautiful enlarged picture you will receive for your trouble. We wouldn't offer anything that wasn't first class.

The Missouri Farmer.

The Plunderer

By ROY NORTON

Author of "The Garden of Fate"

(Continued from last issue)

They took a desperate chance on foul air and plunged down the drift, pausing only now and then when they came to the first side drifts to make sure of their course. They were informed by the plans that they had barely three hundred feet to explore, yet they had gone even farther than that before they came to a halt, a threatening one, for directly ahead of them the timbering had given way, the shaft caved, and there seemed at first no opening through the debris.

"Well, this looks pretty tough!" exclaimed Bill, stooping down and examining the face of the barrier.

His companion lighted his own candle and together they went over the face of the obstruction.

"It looks to me as if we could open her up a little if we can shift this timber here and use it as a lever," he said, pointing to one projecting near the roof.

"May bring the whole mountain down, but it's our only chance," agreed Bill. "Here she goes. Stand back. No use in both of us getting it."

He caught the end of the timber in his heavy hands, planted his feet firmly on the floor and heaved. The big timber creaked, but did not give. Again he planted himself and this time his great shoulders seemed to twist and writhe until the muscles cracked and then, with a crash, the barrier gave way. He sprang back with amazing quickness and they ran back up the drift for twenty or thirty feet while the mass again readjusted itself and settled slowly into position. A cloud of dust bellowed toward them, half-choking them with its gritty fineness, and then, in a minute, the air had cleared. They went cautiously forward.

"Well, we got some farther, anyhow, unless she comes down while we're working through. We've got a hole to crawl into, and that's something," the big miner asserted.

Before he could say anything more Dick had crowded him to one side and was entering the aperture. He had prevented his partner from taking the first perilous chance. Painfully he made his way, while the man behind listened with terrified apprehension; for none knew better than he the risk of that progress.

"All right, but be careful," a voice came to him faintly from the distance. "She's bad, but the air over here seems good. It's a close shave."

The big miner dropped down and began crawling through beneath the tons of balanced rock, which might give at any instant. Larger than his younger companion, he found it more difficult for his great shoulders persisted in brushing at all times, and now and then he was compelled to squeeze himself through a narrow place that for a moment threatened to be impossible. Once a timber above him gave a little and a rock crowded down until only by exerting his whole force could be sustain it while he scraped his hips through from under it. Then as it descended between his legs he found one of them pinioned. He shut his teeth desperately to avoid shouting, and twisted sidewise, and back, to and fro, at the imminent danger of disloging everything above him. He heard an anxious voice calling outside and replied that he was coming and was all right. He rested for an instant to regain breath, then made a desperate forward effort to find that his foot alone caught him. Again he rolled from side to side, and again he rested.

"Bill! Bill! For God's sake, what has happened?" he heard an agonized call from ahead.

"I'm all right, boy," he called back patiently. "Just keep away from the hole so I can get air. I'm—I'm just findin' some places a little tight."

His reply did not seem to allay the solicitude of his companion, who called again, "Can I help you in any way?"

"Only by keeping clear. I'll makefeet," Dick assented, finding that it another try. Stand clear so if she comes down you won't be caught. If she does come—well—good-bye, Dick!"

As he spoke the final word he made another fiercely desperate effort from his new position. There was a ripping, searing pain along the length of his foot which he disregarded in that supreme attempt and suddenly he seemed to slide forward while back of him came a crunching, grinding noise as the disturbed rock which had pinioned him settled down into place. He crawled desperately forward. A light flared in his eyes and he felt strong hands thrust under his arm pits and was jerked bodily out to the floor of the drift. They fell together and the candle, falling with them, was extinguished. They were overwhelmed, as they lay there in the darkness, gasping by a terrific crashing impact as if the whole mountain had given way and at their very feet huge rocks thundered down. They crawled farther along on hands and knees and the falling rock seemed to pursue them malignantly. For an age it seemed as if the whole drift would give way as each set of timbers came to the strain and failed to hold. Then again all was still.

Strangling, sweating, spent, they got to the side wall and raised themselves up, gasping for fresh air. Their senses wavered and swooned in that half-suffocation and slowly they comprehended that they were still alive and that the dust was settling. "Are you all right?" they called to each other in acute unison, their voices betraying a great apprehension, and then, reassured for the instant, they sagged weakly against the walls and each reached out to find the other. Their hands met and clasped fervently and, again in unison, they said, "Thank God!"

A match spluttered dimly through the dark and dust-clogged air, a candle slowly took flame and they looked at each other. Bill was leaning against the wall, weakly, and trying to recover his strength. A tattered trousers leg clung above his bared leg and foot where he had wrenched himself loose from the rock, and torn his boot away in so doing. Along the length of the white flesh was a flaring line of red, where the point of rock had cut deeply when he made that last desperate struggle to escape. He dropped to the floor and clutched his wound with his hands while Dick, almost with a moan, thrust his candlestock into a timber and savagely tore his shirt off and rent it into strips. He stooped over and with hasty skill bandaged the wound.

"It's not bad, I hope," he said, "but it does hurt, doesn't it, old partner?"

"That's nothin'," bravely drawled the giant, striving to force a grin to his pain-drawn lips. "Don't worry now, boy! Think what might have happened if I'd been there a minute or two longer, or if I couldn't have got loose at all!"

In their thankfulness for the last escape they had almost forgotten the fact that their situation was still almost hopeless, and that perhaps the speedy end would have been preferable to one more agonizing, more slow, to come. They got to their feet at last and hobbled forward, the big man resting half his weight on his friend's shoulder and making slow progress. Again they were centered on the faint hope that beyond was some sort of opening, because now they knew but too well that their retreat was effectually cut off. If there was no opening ahead they were doomed. They consulted the plan again and went forward. Abruptly they came to a halt, shutting their jaws hard. They had come to the end of the main drift and it was a blank wall of solid stone where the prospectors had finished!

"Well, old man, there's still the two side drifts to examine," said Bill with a plain attempt to appear hopeful that did not in the least deceive the other.

"Yes. That's back there about fifty feet," Dick assented, finding that it required an effort to steady his voice. "The other one is behind that barrier."

They looked at each other, reading the same thought. They had but one more chance and that was almost futile; for the plans indicated that the side drift extended but a score or so of yards and had then been abandoned. They felt their feet faltering when they turned into it, dreading the end, dreading the revelation that must tell them they were to die in this limited burrow in the hills. But courageously they tried to assume an air of confidence. They did not speak as they progressed, each dreading that instant when he would again face an inexorable barrier. They counted their steps as they went, to themselves. They came to the twentieth, twenty-first, twenty-second, and were peering fixedly ahead. Together they stopped and turned toward each other. Dimly in the faintly thrown light of the candle beams, they could see it, the dusky gray mass where hope had pictured a continuing blackness. The wall leered at them as they stood there panting, despairing, desperate as trapped animals. Their imaginations told them the end.

"Well, old man"—Bill's voice sounded with exceptional softness—"they didn't extend this drift any farther. All we can do now is to go up and sit down at the foot of it, and—wait!"

"But it won't take long, Bill," Dick replied. "The air, you know. It can't last forever."

They trudged forward for the few remaining yards and then, abruptly, the candle they were carrying gave a little flicker. This time they stopped in their tracks and shouted. Bill suddenly loosened his hold on the younger man's shoulder and began hopping forward, and the light threw huge, grotesque, strangely moving shadows on the wall ahead of them. Dick ran after him, crowding on his heels and shouting meaningless hopes. Abruptly they came to a right-angle drift, and then, but a few yards down it, they discovered an upraise, crude and uncared for, but climbing into the higher darkness, and down this there streamed fresh air.

It was such a one as prospectors make, having here and there a pole with cleats to serve as a ladder, then ascending at an incline which, though difficult, was not impossible ,and again reverting to rock footholds at the sides. Up this Dick boosted his partner, thrusting a shoulder beneath his haunches and straining upward with the exultation of reaction. They were saved! He knew it! The fresh air told that story to their experienced nostrils. Up, up, up they clambered for a long slanting distance and then fell out on the floor of another drift, at whose end was a shadowy light. Again they hobbled down a long length, ever approaching their goal. Bill stopped and leaned against the side wall and voiced his exultation.

"I know where we are," he exclaimed. "This is the blacksmiths' tunnel. They made that upraise following the ore, and that's why the mine was opened for the second time here. They didn't complete the plans because they knew the old work was useless. Dick, we've been through some pretty hard times together and had some narrow shaves; but I don't care for many more like that; Come on. Help me out. I want you to take a look and see if my head is any whiter than it was at nine o'clock this mornin' when we went into that other hole."

CHAPTER V

THE AGED ENGINEER

The sunlight was good to see again —good as only sunlight can be when men have not expected ever again to be enlivened by its glory. They were astonished at the shortness of the time of their imprisonment. They had lived years in dread thought, and but a few hours in reality. They had suffered for the spans of lives to find that the clock had imperturbably registered brief intervals. They had played the gamut of dread, terror, and anguish, to learn how trivial, after all, was the completed score.

"I think that will do," said Dick, with a sigh of relief, as he straightened up from bandaging Bill's leg. "The stitches probably hurt some, but aside from a day's stiffness I don't think you will ever know it happened."

"Won't eh?" rumbled the patient. "Sure, the leg's all right; but it ain't bruised limbs a man remembers. They heal. You can see the scars on a man's legs, but only the Lord Almighty can see those on his mind, and they're the only ones that last. Dick, now that it's all over, I ain't ashamed to tell you that there was quite a long spell down there underground when I thought over a heap of things I might have done different if I'd had a chance to do 'em over again. And, boy, I thought quite a little bit about you! It didn't seem right that a young fellow like you, with so much to live for, should be snuffed out down there in that black place, where the whole mountain acted as if it was chasin' us step by step, to wipe us off the slate."

He stood on his feet and limped across the room to his coat in an effort to recover himself, and Dick, more stirred than he cared to admit by the affection in his voice, tramped out to the little porch in front and pretended to whistle a tune, that proved tunless. He looked at the little valley around the shoulder of the mountain at the head of the ravine, which they had so carelessly invaded that morning, and shuddered. Inside he heard Bill moving around, and then after a time his steps advancing stiffly, and turned to see him coming out.

"I think," he said smiling, "that we're entitled to a rest for today. By tomorrow you'll be all right again, unless I'm mistaken. Let's put in the day looking over these old records."

Bill grinned whimsically and assented. He could keep quiet when he had to; but the day following found him again restlessly investigating anything that seemed worth the trouble and the afternoon saw him standing looking upward toward the same valley of dread.

"I've got over it a little," he said to the younger man, "and do you know I'm right curious to go over there and see how big that rock was that tumbled into the mouth of the old shaft. Want to come along?"

Dick had sustained that same curiosity, so together they made their way to the beginning of the previous day's disaster. They chilled when they saw how effectually they had been caught; for the boulder completely filled the entrance to the shaft and would have proved a hopeless trap had they tried to escape by burrowing around its edge. It rested, as they had discovered, on solid rock, and its course down the hillside was clearly marked.

"What gets me," said the veteran miner, "is what could have started it. I noticed it up there when we went in. It was sort of poised on that little ledge you see, and it didn't have to roll more than thirty feet."

He began to climb up the boulder's well-defined path, and suddenly called to his partner with hoarse shout, needlessly loud.

"Come up here," he said. "That boulder never started itself! Some one helped it. What do you think of that?"

Dick hastily climbed up to his side and looked. The rock around was bare of growth or covering, so that no footprints could be discerned; but a rock rested there that had plainly been used as a fulcrum. The surface beneath it was weather beaten and devoid of moisture, which indicated that it had lain there but a short time, probably only from the time of its mission on the preceding day. They found themselves standing up and staring around at the surrounding hills as if seeking sight of the man who had attempted to murder them.

"We'll find out about this!" Bill exclaimed. "Good thing we know enough to look."

He limped to the edge of the barren spot and began to circle around its edge, while Dick did likewise, following his example. They found a footprint at last and took the trail. It did not lead them far before they came to a path on top of the hill that was so well used that any attempt to follow it was useless; but, intent on seeing where it led, they walked along it as it led straight away toward the timber. Scarcely inside the cool shadows of the tamaracks they paused and looked at each other understandingly; for thrown carelessly into a clump of laurel was a long, freshly cut sapling, that had been used as a lever. They recovered it from its resting place and

inspected it. There was no doubt whatever that it had been the instrument of motion. Its scarred end, its length, and all, told that the man who had used it had carried it this far to discard it, believing his murderous work done.

"I noticed that rock, as I said before," declared Bill. "You noticed how round it was on one side? Well, a man could take this lever, and by teetering on it until he got it in motion, finally upset it. The chances were a hundred to one it would land in the mouth of the shaft. And it's a cinch, it seems to me, he wouldn't do that for fun."

Dick shook his head gravely.

"But who could it be?" he insisted. "Who is there that could want us out of the way badly enough to murder us? No one here knows or cares a continental about us! It seems incredible. It must have been sheer carelessness of some restless loafer who wanted to see the rock roll."

Yet they knew that the theory was scarcely tenable. They walked farther along the path and found that it was one used by workmen, evidently, leading at last down the steep mountain side and across to the Rattler. They surmised that it must be one made by the timber cutters for the mine, and learned, in later months, that the surmise was correct.

"It makes one thing certain," Bill declared that evening when, candidly discouraged, they sat on the little porch in front of the office they had made their home and discussed the day's findings. "And that is that until we get a force to work here, if we ever do, it ain't a right healthy place for us. Of course with a gang of men around there wouldn't be a ghost of a chance for any enemy to get us; but until then we'd better watch out all the time. I begin to believe that about everything that's happened to us here has been the work of somebody who ain't right fond of us. Wish we could catch him at it once!"

There was a grim undercurrent in his wish that left nothing to words. They remembered that in all the time since their arrival they had seen no other human being, the Rattler men had left them as severly alone as if they had been under quarantine.

In the stillness of twilight they heard the slow, soft padding of a man's feet laboriously climbing the hill, and listened intently at the unusual sound.

"Wonder who that is," speculated Bill, leaning forward and staring at the dim trail. "Looks like a dwarf from here. Some old man of the mountain coming up to drive us off!"

"Hello," hailed a shrill, quavering voice. "Be you the bosses?"

"We are," Dick shouted, in reply, "Come on up."

The visitor came halting up the slope, and they discerned that he was lame and carrying a roll of blankets. He paused before them, panting, and then dropped the roll from his back, and sat down on the edge of the porch with his head turned to face them. He was white headed and old, and seemed to have exhausted his surplus strength in his haste to reach them before darkness.

"I'm Bells Park," he said. "Bells Park, the engineer. Maybe you've heard of me? Eh? What? No? Well, I used to have the engines here at the Cross eight or ten years ago, and I've come to take 'em again. When do I go to work? They hates me around here. They drove me out once. I said I'd come back. I'm here. I'm a union man, but I tell 'em what I think of 'em, and it don't set well. When did you say I go to work?"

"I'm afraid you don't go," Dick answered regretfully.

The Cross, so far as he could conjecture, would never again ring with the sounds of throbbing engines. Already he was more than half convinced that he should write to Sloan and reject his kindly offer of support. "We've been here but a week, but it doesn't look promising to us."

"Well, then you're a pair of fools!" came the disrespectful and irascible retort. "They told me down in Goldpan that some miners had come to open the Cross up again. You're not miners. I've hoofed it all the way up here for nothing'."

The partners looked at each other, and grinned at the old man's tirade. He went on without noticing them, speaking of himself in the third person:

"I can stay here tonight somewhere, can't I? Bells Park is askin' it. Bells Park that used to be chief in the Con and Virginia, and once had his own cabin here—cabin that was a home till his wife went away on the long trip. She's asleep up there under the cross mark on the hill. Bells Park has come back because he wanted to be near where she was put away! She was the best woman that ever lived. I'm looking for my old job back. I can sleep here, can't I?"

His querulous question was more of a challenge than a request, and Dick hastened to assure him that he could unroll his blankets in a bunk in the rambling old structure that looomed dim, silent, and ghostly, on the hill beyond where they were seated. His pity and hospitality led him farther.

"Had your supper?" he asked.

Bells Park shook his head in negation.

"Then you can share with us," Dick said, getting to his feet and entering the cabin from which in a few moments came a rattle of fire being replenished, a coffee-pot being refilled, and the crisp, frying note of sizzling bacon and eggs.

"Who might that young feller be?" asked the engineer, glowering with sudden curiosity, after his long silence, into the face of the grizzled old prospector, who, in the interim, had sat quietly.

"Him? That's Dick Townsend, half-owner in the mine," Bill replied.

"Half owner? Cookin' for me? Why don't you do it? What right have you got sittin' here on your long haunches and lettin' a boss do the work? Hey? What are you?"

"I'm his superintendent," grinned Bill, appreciating the joke of being superintendent of a mine where no one worked.

"Oh!" said the engineer. And then, after a pause, as if readjusting all these conditions to meet his approval: "Say, he's all right, ain't he!"

"You bet your life!" came the emphatic response.

The applicant said no more until after he had gone into the cabin and eaten his fill, after which he insisted on clearing away the dishes, and then rejoined them in a less-tired mood. He squatted down on the edge of the porch, where they sat staring at the shadows of the glorious night, and appeared to be thoughtful for a time, while they were silently amused.

"You're thinkin' it's no good, are you?" he suddenly asked, brandishing his pipe at Dick. "Well, I said you were a fool. Take it kindly, young feller. I'm an old man, but I know. You've been good to me. I didn't come here to butt my nose in, but I know her better than you do. Say!" He pivoted on his hips, and tapped an emphatic forefinger on the warped planks beneath in punctuation. "There never was a set of owners shell-gamed like them that had the Croix d'Or! There never was a good property so badly handled. Two superintendents are retired and livin' on the money they stole from her. One millman's bought himself a hotel in Seattle with what he got away with. There was enough ore packed off in dinner-pails from the Bonanza Chute to heel half the men who tapped it. They were always lookin' for more of 'em. They passed through a lead of ore that would have paid expenses, on the six-hundred-foot level, and lagged it rather than hoist it out. I know! I've seen the cars come up out of the shaft with a man standin' on the hundred foot to slush 'em over with muddy sump water so the gold wouldn't show until the car men could swipe the stuff and dump it out of the tram to be picked up at night. It ain't the rich streaks that pays. It's the four-foot ledge that runs profit from two bits to a couple of dollars a ton. That's what showed on the six-hundred level. Get it?"

The partners by this time were leaning eagerly forward, half-inclined to believe all that had been told them, yet willing to discount the gabbling of the old man and find content. Until bedtime he went on, and they listened to him the next morning, when the slow dawn crept up, and decided to take the plunge. And so it was that Dick wrote a long statement of the findings to his backer in New York and told him that he was going to chance it and open the Croix d'Or again until he was satisfied, either that it would not pay to work, or would merit larger expenditure.

Once again the smoke belched from the hoisting house of the Cross, and the throb of the pumps came, hollow and clanking, from the shaft below. A stream of discolored water swirled into the creek from the waste pipes, and the rainbow trout, affrighted and disgusted, forsook its reaches and sought the pools of the river into which it emptied.

Slowly they gained on its depths, and each day the mark swam lower, and the newly oiled cage waited for its freshly stretched cable, one which had happened to be coiled in the storehouse. The compressor shivered and vibrated as the pistons drove clean, sweet air through the long-disused pipes, and at last the partners knew they could reach the anticipated six-hundred-foot level and form their own conclusions.

"Well, here goes," said Bill, grinning from under his sou'wester as they entered the cage with lamps in hand. "We'll see how she looks if the air pipes aren't broken."

They saw the slimy black sides of the shaft slip past them as Bells Park dropped them into the depths, and felt the cage slow down as he saw his pointer above the drum indicate the approach of the six-hundred-foot level. They stepped out cautionsly, whiffed the air, and knew that the pipes, which had been protected by the water, were intact, and that they had no need to fear foul air. The rusted rails, slime-covered, beneath their rubber boots, glowed a vivid red as they inspected the timbering above, and saw that the sparse stulls, caps, and columns were still holding their own, and that the heavy porphyritic formation would scarcely have given had the timbers rotted away. Dank, glistening walls and a tremulous waving blackness were ahead of them as they cautiously invaded the long-deserted precincts, scraping and striking here and there with their prospector's picks in search of the lost lead.

"About two hundred feet from the shaft, Bells said," Dick commented. "And this must be about the place where they cut through pay ore in search of another lobe of the Bonanza Chute. What thieves they were!"

He suddenly became aware that his companion was not with him, and whirled round. Back of him shone a tiny spark of flaring light, striving to illumine the solid blackness. He paused expectantly, and a voice came bellowing through the dark:

"Here it is. The old man's right, I think. This looks like ore to me."

Dick hastened back, and assisted while they broke away the looser pieces of green rock, glowing dully, and filled their sample sacks.

Three hours later they stood over the scales in the log assay-house above, and congratulated each other.

"It'll pay!" Dick declared gleefully. "Not much, but enough to justify going on with the work. I am glad I wrote Sloan that I should draw on him, and now we'll go ahead and hire a small gang to set the mill and the Cross in shape."

They were like boys when they crossed to the engine house and told the news to the hard-worked engineer, who chuckeled softly and asserted that he had "told them so."

"Now, the best way for you to get a gang around here," he said,' 'is to go down to Goldpan and tell 'The Lily' you want her to pass the word, or stick a sign up in her place saying what men, and how many, you want."

"Sounds like a nice name," Mathews commented.

"The Lily?" questioned Dick, anxious as to who this camp character could be.

"Sure," the engineer rasped, as if annoyed by their ignorance. "Ain't you never heard of her? Well, her right name, so they tell, is Lily Meredith. She owns the placed called the High Light. Everybody knows her. She's square, even if she does run a dance hall and rents a gamblin' joint. She don't stand for nothin' crooked. Lily don't. She pays her way, and asks no favors. Go down and tell her you want men. They all go there, some time or another."

He stooped over to inspect the fire under the small boiler he was working, and straightened up before he went on. Through the black coating on his face, he appeared thoughtful.

"Best time to see The Lily and get action is at night. All the day-shift men hang around the camp then, and, besides that, they've got a new batch of placer ground about a mile and a half over the other side, and lots of them fellers come over. Want to go today?"

The partners looked at each other, as if consulting, and then Dick said: "Yes. I think the sooner the better."

Bells Park pulled the visor of his greasy little cap lower over his eyes, and stepped to the door.

"Come out here onto the yard," he said, and they followed. "Go down to the Rattler, then bear off to the right. The trail starts in back of the last shanty on the right-hand side. You see that gap up yonder? Not the big one, but the narrow one." He pointed with a grimy hand. "Well, you go right through that and drop down, and you'll see the camp below you. It's a stiff climb, but the trail's good, and it's just about two miles over there. It's so plain you can make it home by moonlight."

Without further ceremony or advice, he returned into the boiler-room, and the partners, after but slight preparations, began their journey.

It was a stiff climb! The sun had set, and the long twilight was giving way to darkness when they came down the trail into the upper end of the camp. Some embryo artist was painfully overworking an accordion, while a dog rendered melancholy by the unmusical noise, occasionally accompanied him with prolonged howls. A belated ore trailer, with the front wagon creaking under the whine of the brakes and the chains of the six horses clanking, lurched down from a road on the far side of the long, straggling street, and passed them, the horses' heads hanging as if overwork had robbed them of all stable-going spirit of eagerness.

The steady, booming "clumpety-clump! clumpety-clump!" of a stamp-mill on a shoulder of a hill high above the camp, drowned the whir and chirp of night insects, and from the second story of a house they passed they heard the crude banging of a piano, and a woman's strident voice wailing, "She may have seen better da-a-ys," with a mighty effort to be pathetic.

"Seems right homelike! Don't it?" Bill grinned and chuckled. "That's one right nice thing about minin'. You can go from Dawson to Chiapas, and a camp's a camp! Always the same. I reckon if you went up the street far enough you'd find a Miner's Home Saloon, maybe a Northern Light or two, and you can bet on there bein' a First Class."

The High Light proved to be the most pretentious resort in Goldpan. For one thing it had plate-glas windows and a gorgeous sign painted thereon. Its double doors were wide, and at the front was a bar with a brass rail that, by its very brightness, told only too plainly that the evening's trade had not commenced. Two bartenders, one with a huge crest of hair waved back, and the other with his parted in the middle, plastered low and curled at the ends, betokened diverse taste in barbering. A Chinese was giving the last polish to a huge pile of glasses, thick and heavy.

On the other side of the room, behind a roulette wheel, a man who looked more like a country parson than a glambler sat reading a thumbed copy of Taine's "English Literature." Three faro layouts stretched themselves in a line as if watching for newcomers, and in the rear a man was lighting the coal-oil lamps of the dance hall. It was separated from the front part of the house by an iron rail, and had boxes completely around an upper tier and supported by log pillars beneath, and a tiny stage with a badly worn drop curtain.

(Continued in next issue)

We would be glad to have our women readers send us stories of neighborhood club work that we may publish on the "Home Makers" page. There are more than a hundred women's clubs organized among farm women and if every club would send but one report during the year we would have three or four reports in every issue. I am sure something of interest will happen in every club that will help other clubs if printed.

Farm Management

D. H. Doane, University of Missouri

Lord, give the mothers of the world
More love to do their part;
That love which reaches not alone
The children made by birth their own,
But every childish heart.
Wake in their souls true motherhood,
Which aims at universal good.
—Ella Wheeler Wilcox.

Lots of wet weather gives us plenty of time to think. Have all of our thoughts been devoted to self, or to others?

Have you made a resolution to help a homeless child? Let this month see that resolution become a deed.

The Missouri Farmer Family and What They Have Done to Help the Little Ones

Think of it, we are 50,000 strong. We are found in every county in Missouri and in many counties out of the state. Most of us live on farms that we own and have in addition to our property a substantial bank account. True, I realize that not all of us are so fortunately situated but this applies to a great many of the 50,000 readers of this paper. In order to show how deeply we have concerned ourselves with the wants and needs of little homeless children, I am going to give you a complete list, or at least a report received the latter part of July covering a statement of what we have done in answer to the call from these homeless children for some of the abundance that surrounds us. Mrs. Ziemendorff, writing from the Sheltering Arms Home, St. Joseph, Missouri, says:

"I received your letter and am sorry to say that we have not received any more donations since you were here, although we have the promise of a case of eggs from a Mr. ..... of Shelbyville, Mo. We have had quite a number of letters from friends in regard to taking some children, but many do not want to adopt them..... Here is the list of things we have received: One case of eggs from Mrs. Taylor and friends, Maryville, Mo., $5 from Mrs. Allen, Macon, Mo., $5 from a friend; five children have been placed in homes through The Missouri Farmer."

This is the month that school begins. Eggs are cheap and plentiful. Let us as school teachers make one sincere effort this month to have each child bring a few eggs that at least a half case may be accumulated and sent to this worthy home for homeless children at St. Joseph. For those of you who have not kept in touch with the work that we are trying to do for these little ones, I will say that at St. Joseph, there is an institution called the Sheltering Arms Home, supported entirely by donations from friends of the institution, that takes homeless children and keeps them until they can be put into good, christian homes. What we desire is to assist in finding country homes for these little ones. We realize that it is not possible for everyone to adopt a child but it is possible for each of us to do some part in helping toward the worthy work that Mr. and Mrs. Ziemendorff, who have charge of this home, are doing for these little friendless and homeless people. The reason that we are asking for eggs is, that eggs are comparatively plentiful in the country and that we can share this gift without feeling any very great strain, and it is a food that Mrs. Ziemendorff says they need most of all at the Home. The last case of eggs that was sent by a friend caused one little tot to exclaim, when told that a friend had sent the eggs, "Oh, my, I wish they'd send a bushel." We are not asking for a bushel this time, but just simply suggesting that each one contribute a few dozen, and where there are Homemakers' Clubs, women's clubs and boys' and girls' corn and tomato clubs, the few that each contributes will make up a case or two, at least a part of a case that can be sent according to the address given. You need not pay express if you do not wish to, simply send them collect. Be sure to mark your gifts carefully so that Mrs. Ziemendorff will know who sent them.

If you wish to know more about these children, write direct to Mr. W. A. Ziemendorff, Humane Officer, St. Joseph, Mo., and you can thus obtain full details.

The "Garden Spot" of Missouri

This Is a Designation Richly Deserved by the "Drainage District" of Southeast Missouri

Here is where farmers produce 40 bushels of wheat and 100 bushels of corn per acre, and the reason of it is that it is impossible to conceive of a soil more rich than ours. Never has Southeast Missouri presented a picture of greater opulence than this year. Everywhere the eye is greeted by great piles of wheat straw and jungles of corn. Truly this is a "Land of Plenty"—a land where Corn, Wheat, Alfalfa, Cotton, Watermelons, etc., flourish as nowhere else in the Mississippi Valley. What's the use of farming on worn-out land when you can get hold of a farm down here that will produce as much in one year as your worn-out farm will in four? We have a lot of fine farms for sale in the Malden District and every one of them will double in value during the next five years. This district is as healthy as you can find anywhere and you will have good schools and good neighbors. Write and tell us what size of farm you want to buy when we will give you the full particulars. Write to any Malden Bank about our honesty.

QUESTIONS CONCERNING THE FEEDING OF LAMBS

A number of letters are coming in at this season of the year asking about lamb feeding. In an effort to answer these questions for others I am stating the questions and my answers to them.

1. Q. What do you mean by Farm Management lambs and the Farm Management system of feeding them?

A. The Farm Management system of feeding lambs is one that the Missouri Farm Management Association members have been following for the past four or five years with entire satisfaction, and a profit in every case where the plan has been followed completely. It consists of pasturing out of the corn fields a growth of cowpeas or soybeans and using at the end of the feeding period a patch of rape grown to finish the lambs on. A Farm Management lamb is one that has been described to the Farm Management Association and can be purchased on the Kansas City market when described in no other way than saying "Farm Management lambs." It means a lamb that will top the market when properly fed according to the system outlined.

2. Q. When should we purchase our feeding lambs?

A. The lambs can be purchased any time after the feed is ready, which is generally from the first of September on to the middle of October.

3. Q. Where can we purchase the lambs?

A. The lambs may be purchased on the Omaha, St. Joseph or Kansas City markets. Probably ninety per cent of them have come from Kansas City, the market that is most handy to the members of the Farm Management Association.

4. Q. How do we buy Farm Management lambs?

A. The Farm Management lambs may be purchased from any reliable commission firm on the markets mentioned. Most of them have been purchased by Clay, Robinson and Company who started the work for the association five years ago. It should be understood that I do not stand as recommending any firm to the exclusion of another. Purchase from the commission firm that you have most confidence in. I am simply outlining the plan that has been followed.

5. Q. What should our lambs cost us?

A. In years past they have cost less than seven cents a pound. This year they will probably cost eight cents or more. In addition to this there will be a charge for commission of $8 for a single deck and $12 for a double deck, dipping, weighing, freight, etc.

6. Q. How high can a person afford to go for feeders?

A. The more experienced feeders would not hesitate to buy lambs at five cents a pound if they knew they could sell them at six, but the same feeders hesitate to pay eight cents even though there is a probability of getting a very good market. It should be remembered that, other things being equal, there is as much profit in feeding a five-cent lamb that sells at six cents as there is in an eight-cent lamb that sells for eight and a quarter. In other words, the higher the feeder the less the needed margin to come out safe. Figure this out, counting the feeder weighing fifty pounds and the fat lamb weighing seventy pounds, a gain that may be expected under good conditions.

7. Q. How are the lambs put onto feed?

A. When the lambs are brought home from the shipping yards they should be put on short pasture and kept there for a day or so until their ravenous appetite is appeased. Then turn them into the corn field where the undergrowth mentioned is growing and leave them there for an hour or two the first day. Each day increase the length of time in the corn field until at the end of ten days to two weeks they should be on full feed and can then be left in the field.

8. Q. What should the lambs eat first?

A. Put the lambs on the poorest, most perishable feed first. Allow them to have better and better feed as the feeding period increases, ending up with the best or certainly that which is most apt to withstand an early frost if we should have it. This means that the rape is the last to be consumed. Start with the cowpeas, soybeans second and finish as mentioned.

9. Q. How long should they be on feed?

A. Sixty to ninety days will generally make a satisfactory feed. This depends, however, upon the number of lambs and the kind and amount of feed.

10. Q. How many lambs can be fed per acre?

A. A good growth of soybeans or cowpeas in the corn with enough rape to finish (the rape should be in proportion of about one-tenth as many acres as there is undergrowth in the corn) will fatten from six to eight lambs per acre of feed.

11. Q. Will crabgrass, foxtail, weeds and corn blades make a satisfactory feed?

A. No, the sheep will eat it but they will make no more gain on it than a steer. Everyone realizes that there is very little nutriment in this class of undergrowth and it should not be counted upon to play any important part in the feeding.

12. Q. Is there anything that can be used to substitute rape?

A. Any feed that has a high feeding value, that will withstand the frost or is available after freezing weather will take the place of rape, to a degree, at least. Such feeds as fairly well matured clover, in some cases alfalfa, will do fairly well. They are not as good as rape but will frequently be found satisfactory. In some cases good sweet silage has been used to finish up on. We have not had much experience on this feed and are not in a position to recommend it, although some of our farmer acquaintances speak of it very highly.

13. Q. Where and when should the lambs be sold?

A. The lambs should be sold at St. Louis or Chicago as these markets are higher than the western ones. If possible, they should go before Christmas as the Christmas market is generally low on mutton and there is not much demand for it.

14. Q. How much profit can one reasonably expect from a single deck of lambs—125 to 150 head?

A. Under ordinary conditions, and with a margin this year of from twenty-five cents to a dollar, the lambs should net from seventy-five cents to $1.50 a head. This will depend upon freight rates, rate of gain of lambs, loss, etc.

15. Q. What is an expected loss?

A. If you do not have more than a four per cent loss do not count it as unusual.

16. Q. What are the chief dangers to watch?

A. One is to see that the lambs do not go onto feed too rapidly. Watch carefully that they do not eat too much corn, as this is apt to bloat them. In the last two or three years the western lambs have had a disease or trouble called "big head" that has been very serious, as it has caused the loss of a large number of lambs. We know of no way to guard against this, and it can be counted but one of the risks of the business. However, when lambs begin to come down with "big head" a swelling of the head, ears and eyes can be noticed and the lambs walk with dropped ears and head, paying little attention to what is going on. These are the early symptoms that may be noticed at the yards or soon after getting home, if the lambs seem to have the disease.

Further information on this subject will be gladly given to those who are interested.

TELL US WHAT YOU ARE DOING

My Dear Sister Home-Makers:

We would like to hear more from our clubs over the state, what you are doing and along what lines you are working.

Let us make use of this department and tell each other what we are accomplishing.

We would like to know some of the topics you are discussing in your meetings and by giving them to this department we can all receive the benefits besides the exchanging of ideas will truly help all.

At our last Pettis County Homemakers' meeting we had a paper on "Economy and Waste" by Mrs. M. D. Norton, one of our faithful and capable members. It was freely discussed and proved most helpful and interesting.

We are sending you the paper hoping your club may enjoy it also and we shall be pleased to have something from your club. [Every member of every woman's club in Missouri could get the best of all the clubs if the members would send it to this department.]

We shall be glad to again hear from the clubs who have written me of their work also from others with whom I have not come in touch. Let us get better acquainted.

Mrs. Harry Sneed,
Meadow Lawn Farm.

WASTE AND ECONOMY

We as a nation are the most extravagant in the world. It costs over two hundred million dollars a year to play golf and it is said that the food wasted in the United States would feed all of Europe.

The wastefulness of the average housewife does not come as a rule from wilful extravagance but rather from sheer lack of training in efficient household management.

False standards of living, with extravagance in dress, food and shelter are to blame for much of modern ills.

Families whose incomes do not warrant it ape the manners, amusements and furnishings of others, thus are often led into debt in order to maintain this fictitious mode of life.

It rests with the housewife for a simple, sincere standard of living; then with this standard fixed in mind, she can more satisfactorily expend wisely and successfully for the various items of the family needs.

The greatest waste on the farm is wasted energy among farm women.

You must realize that the woman who gives all her physical strength to the service of her family is not rendering the truest service.

Most of our farms have all modern labor-saving devices. Why should not the wife and daughter demand and continue to demand all possible aid in their heavy work; this would give them more time and strength for other duties.

Housework—the science of homemaking and motherhood—if followed out on an efficient plan can be the most glorious carreer open to any woman—one that will not degrade but which offers her peculiar talents their widest scope.

Homemakers take countless steps and motions in every task many of which are entirely avoidable; it is not because each household task is hard that so many women find themselves fatigued, but that their work is poorly planned—poorly planned work results in too much changing and hence too much wasted vitality.

"Motherliness" and "homeiness" in the past usually meant drudgery. True and better homemaking will come from a higher realization of the tremendous possibilities of the homemaker who uses scientific methods instead of rule of thumb.

If housework is drudgery for a woman, it is only because that woman refuses to accept the efficient method and improved equipment offered her on every hand.

Only eight per cent of the families of the United States keep domestic help. Think of the number of women doing all their own work. But more expert advice is being offered them than is being offered any manufacturer.

The finest specialists and experts are retained by magazines to tell women how to care for babies; prepare food; how to economize and how to make clothing. So subscribe for a good magazine on these lines and not only read the good ideas given in them but put them into practice.

This is the time of the year that affords farm women a few leisure moments. There is no such thing as clock-work in housekeeping on a farm for people with children, hungry men, young folks, chickens, dogs, cats and nature around.

If you want more leisure you have to win it out of the hours of your working day already full to the brim, and the first and last word on time saving is to cut out every unnecessary task.

I know you have to cook, wash and iron, bake and clean for the entire farm family with only what help the children can give, but if you put your mind on it you will be surprised how much of your labor will be spared and nobody be the worse off—in fact all the family will profit with you in your newly acquired hours for rest and recreation.

Take a few minutes every morning to see how often you can put two tasks into the time allotted for one by simplifying every move you make and strictly forbid yourself every useless drudgery.

Stop drying dishes; rinse them freely in scalding water and leave them on edge to dry. Stop starching your clothes; starch has gone out of style. Stop dressing the children in white; ginghams neatly made will last longer and are not always getting spotted. Stop ironing all underclothes, napkins and sheets; hang them carefully on the line and let the wind dry them. Stop using tableclothes. Stop washing over and over an endless array of old cleaning cloths. Stop so much hand sewing and sit down to your work whenever it is possible.

Get a floor mop for dry dusting; you can go over the whole house in less time than the old way took for one room.

As for furniture and ornaments, we in America seem to possess a mania for a profusion of furnishing and bric-a-brac. Whatever is not in actual use or are not things of real beauty, put away in the attic. A farm woman is worth more to the world than a caretaker of lumber.

Of course the washing is the biggest item of hard work for the farm woman and if she has to do it herself, she is often up before daylight to begin. Right here is the place for one of your most needed reforms.

After you have obtained all the conveniences you can get such as proper piping of water with proper drainage out, with set tubs if possible, give up the old-fashion way and back-breaking methods and make the clothes partly wash themselves.

One good way is by soaking them over night in naptha soap, but another way still better is to have a good washing machine with boiling water in which soap has been dissolved.

An hour saved out of every day foots up more than a month of working days every year and you can save more if you try?

Think of all the joy for yourself, not to mention all the good for your family and the community that could be crowded into such an aggregate of economized time.

The efficiency tool surrounds the housekeeper on every side, but it depends largely upon the housewife whether she needs it or not. She must consider whether it is a paying investment for her particular family. They can all be grouped under four heads: Fuel savers, step savers, labor savers and time savers.

The first great need for comfort in living is better construction in houses. Countless accidents happen because of steep stairways, doors opening the wrong way, windows and doors which are not well fitted and sharp corners where a curve could easily have been placed.

The kitchen especially has been neglected by the builder, the position of stove, sink and shelves are rarely convenient, and the height of the table, tubs and sink are not adjusted to the one who is to use them most.

The housewife should make it her aim to study all conditions inside the house to secure labor-saving devices and especially to train all members of the household in labor saving habits as well as into a general spirit of helfulness where working together it is necessary that the duties of each be defined and that all implements have well chosen places to which each is returned after using. It may save friction to label shelves and hooks as well as boxes and drawers.

For all processes which must be frequently repeated, especially those of cleaning like dishwashing, sweeping and laundry, there should be the best possible facilities. There is no economy in heavy brooms, cheap brushes or inferior cotton dish towels.

Too often women are drudges when a man slavishly accepts her work and sacrifice for her children who do not understand the work she puts forth in their behalf. If men will co-operate and assist women to bring about this new housekeeping certainly a greater companionship between them will be created.

Mrs. M. D. Norton,
Rt 4, Sedalia, Mo.

Help to create an apple eating crusade to promote the consumption of Missouri apples this fall. All housekeepers can fall in line by serving apples to their families in as many different ways as possible.

If you have any extra methods of cooking apples let us have them.

From an appreciative reader comes the following inquiry and we shall be pleased to hear from some of our experienced bread-makers who have either had similar trouble or understand the cause of this young woman's bread souring:

"During the last few weeks we have had trouble with our bread. It gets so sticky that when a knife is run through it the knife comes out sticky and white. The bread also smells badly. We have been cooking four loaves, medium size and the first two will be all right but the third will begin to get sticky and off in flavor."—V. M.

"The Quality Goes IN Before the Name Goes ON"

What To Look For In Buying A Piano

Remember a Piano is, first of all, a musical instrument, not merely a piece of furniture. It must have the musical qualities as well as beauty of design and finish. Decide first on Tone, Action and Durability—select design and finish afterward.

Crown Pianos

are built for lasting musical quality. Perfection of tone is the reason for every part, every bit of workmanship, every careful refinement in construction. The very purity and strength of tone show superior quality. It does not take a trained musician to appreciate the tone of the Crown Piano. All music lovers recognize its beauty.

The action transmits the touch of the fingers to the strings. It must respond accurately to every variation.

To show sensitiveness of action, try getting a soft tone by a very light touch with the "loud" pedal on; then loud crashes to show its strength and wide range of possibilities. Try quick repetitions on the same keys to test the elasticity. These tests show the superiority of the Crown action.

Don't buy the first piano you look at. The more you investigate the more you will appreciate the Crown.

Send for our booklets telling more about how to select a piano. They are FREE.

Harvey's Annual O. I. C. and Chester White Sale

Elsewhere in this paper will be noticed the advertisement of J. H. Harvey, Maryville, Mo., in which he announces that on Tuesday, October 5, he will hold his annual sale of O. I. C. and Chester Whites.

Here is an offering that will appeal to our readers who are interested in securing choice individuals of proven merit. We make this statement because we are familiar with the kind that Mr. Harvey is producing. Mr. Harvey is one of the pioneer hog breeders of this state and his name is no doubt familiar to many of our readers—especially the older ones. Few men have stayed with the business through thick and thin as long as he, and naturally in all these years he has accumulated a very valuable knowledge of the business. It is no idle statement to say that his herd is stronger now than ever and that this year's offering is as good as any he has ever made, because such is the fact.

Sixty-five head are listed and represent the very tops of the 1915 farrow. They are sired by several of the greatest boars of the breed and are out of sows that are conceded to be among the really good ones of the Corn Belt. A number of litters are sired by the good young boar International Boy, the boar Mr. Harvey sold to head J. J. Wills herd at Platte City, Mo. As usual Barber Girl 42882 C. W. R. contributes a crack litter. Harvey's Perfection furnishes a capital litter among them are several outstanding boars and gilts. The good sow Peach Blossom is represented by some corking good boars and gilts sired by International Boy. Three litters out of good sows and sired by Demonstrator, one of the largest boars of the breed. Several herd boar prospects are in the litter of Highland Kind, a wonderfully good young sow, and sired by Wildwood Prince, the champion and grand champion at Des Moines last year and will furnish competition for the buyers.

Our readers need not have the slightest hesitancy to attend this sale as we assure them that they will be pleased with the offering throughout. The catalogs are ready to mail and will be sent to all who write mentioning this paper.

Important Angus Sale

J. W. Austin, Carrollton, Mo., claims Tuesday, October 5th, for a dispersion sale of his well known herd of Angus cattle. About 110 head will be listed, consisting of bulls, cows, and heifers of the most popular and fashionable families—Blackbirds, Pride of Aberdeen, Queen Mothers, Drumin Lucies and Nosegays.

The advertisement will appear in a later issue of The Missouri Farmer and further details concerning the offering will be announced. In the meantime we would suggest that you write for catalog. Please mention The Missouri Farmer when you write.

Report of Faulkner's Sale

The sale of Spotted Poland Chinas held by H. L. Faulkner, Jamesport, Mo., August 10th, resulted in an average slightly under $40. While this average is considerbly below Mr. Faulkner's usual sales, he expressed himself as fairly well pleased in view of the fact that the sale occurred at a time when farmers and breeders were extremely busy thrashing and haying. The few buyers who were there and those who were represented by mail bids secured excellent bargains, and can not help but feel well satisfied with their purchases. Mize & Linn, Clinton, Okla., secured the two highest priced sows when they paid $120 and $115 for Nos. 10 and 11. Col. P. M. Gross, Macon, Mo., did the selling and was assisted by Cols. Wells, Shephard, Nelson and others.

Last Call for Richards & Son's Great Poland China Sale

This is to remnid our readers that on Wednesday, September 8, J. F. Richards & Son, Bevier, Mo., will sell fifty head of very high class Poland China bred sows, gilts and boars.

The offering is strictly first class in every way and will afford a rare opportunity for breeders and farmers to secure Poland China breeding stock of the most approved type. If there is one feature of the offering that is more noticeable than others it is the degree of quality and size offered.

Messrs. Richards have selected and handled this offering with the view of attracting the most critical buyers and we can assure our readers that they will in no way be disappointed. Everything offered, save one tried sow, has been bred on the farm and the two herd boars, Pawnee Price and Wonder R. are largely represented in the offering. Few, if any herds can boast of two as good boars as Pawnee Price and Wonder R. Pawnee Price is a boar that looks better to you every time you see him—he has size, being in the thousand pound class, extreme smoothness, great width and depth, and throughout is put up on well nigh ideal lines. But far more important is his ability as a sire. We know of no boar that is siring more uniformly good pigs. Perhaps this is due to the fact that he comes from a long line of great sires and dams. Wonder R. is a younger boar of very much the same type and excellencies. Messrs. Richards are using him with very gratifying results on Pawnee Price gilts and many of the choicest things in the sale are sired by him. he proof of the pudding always is in the eating and we suggest that you attend this sale and see for yourself if what we have said is not borne out by the offering. The sows are all bred to one or the other of the above boars and will be sold carrying their own guarantees. Among the sows are several that are good enough to be top sows in any herd—many of the yearlings will weigh 450 pounds.

Among the boars cataloged will be found first class herd boar material. Remember this sale and plan to be on hand when this great offering is sold. We recommend this offering very highly to our readers and trust that many will take advantage of the opportunity. The catalogs are ready to mail and will be sent to all who apply. When writing please bear in mind that Messrs. Richards will appreciate having you mention this paper. R. P. Royce will represent this paper at the sale and will be glad to handle the business of our readers who are unable to attend.

Pawnee Price, J. F. Richards & Son's great boar. A sow bred to this boar will fit into any herd and make it stronger

Bridges Bros.' Strong Poland China Herd

Beginning with this issue a new Poland China herd is introduced to our readers. The herd in question is that Bridges Bros., Slater, Mo.

Here is a herd that promises much for the Poland interests of this state and from now on must be reckoned with when considering the good collections.

The development of this herd is interesting. For years the father of the four members of the firm was one of the most successful and progressive farmers of Saline county. The father realized the profit of pork production and made this his principal business. Always alert to learn new and successful methods of economical production he early learned the value of careful feeding and good blood. As his sons grew up they received the benefit of his wide knowledge of the business. Two of the boys attended the College of Agriculture and upon their return to the farm the father encouraged them to start a pure bred herd. The first selections they made were good ones and soon a nice trade was established among the neighbors. Gradually more sows were added to the herd and finally they felt justified in branching out in a more extensive way. Last winter Bridges Bros. were among the best buyers at the more prominent sales and the class of sows they selected were such as would insure their success from the start. or example, at W. E. Williams' sale at Silex several of the choicest sows became their property, likewise at H. B. Walter's sale they secured one of the best fall yearlings sold last winter; again, at U. S. Byrne's sale at Saxton they bought an outstanding daughter of Wedd's Long Kind and bred to Long Jumbo 2nd. These sows together with the sows already in the herd produced a high class lot of spring pigs from which the top boars are now offered for sale. One of the best litters the writer has seen anywhere is the Big Bob Wonder litter. The Long Jumbo 2d litter is also very high class. Several of the early litters by Longfellow Sampson and Cloverdale Hadley afford herd boar material. The spring pigs by Wonder Ex.—as good a son of Expansion Wonder as the writer knows of—are strong on size and quality. The crowning addition to the herd is the great boar King John. King John was purchased in the Mahan dispersion sale last winter and is one of the very best boars ever sired by Long Kings Equal. He is out of a Jumbo Prospect dam.

Bridges Bros. are reserving their gilts for a bred sow sale this winter and are only offering about twenty head of spring boars. These boars are the tops of the spring pigs. They have unusual size, plenty of bone ,and excellent quality and are being offered at very low prices.

Everything is immune and is sold on a broad guarantee of satisfaction. Write Messrs. Bridges if you want a boar bargain, and kindly mention this paper.

Holstein Bulls for Sale

Last week Wm. Zimmerman, junior member of the firm of M. E. Moore & Co., Cameron, Mo., was in Columbia attending the meeting of the newly organized Missouri Holstein Breeders Association and while here visited The Missouri Farmer office. Mr. Zimmerman informed us that they had recently made a large sale of Holstein cows and heifers from their herd to a Tulsa, Okla., firm, but added that they still had a number of choice young bulls for sale at prices he felt would sure move them. The Moore herd is the oldest herd in this state and for years has been regarded as a top collection in every way. Kindly mention The Missouri Farmer when you write.

Halleck Bland's Poland China Sale September 16

This is the last time that we can call the attention of our readers to Halleck Bland's Poland China sale to be held at the Fair Grounds, near Centralia, Thursday, eptember 16.

RED POLLED

RED POLLED CATTLE

HERD ESTABLISHED 16 YEARS

Young stock for sale at all times.

Young bulls for sale sired by Logan 13500. The duel purpose kind.

M. L. Snyder - Polo, Mo.

sane and conservative manner that permitted it to improve each year. At the head of the herd stands King David, a boar that is concede by all to be high class in every respect. King David is one of the large boars of the breed that possess extreme smoothness and quality coupled with the ability to transmit these desireable qualities to his offspring. He is sired by the great Long King, a boar familiar to every breeder of Poland Chinas. Another boar in service in the herd is Leader, by Grand Leader, while still another very promising young boar is ee Wonder by A Wonder.

The offering this year will consist of nine tried sows, six spring yearlings, five fall gilts, sixteen spring gilts and about sixteen spring boars. The bred sows and spring yearlings sell bred for September and October farrow to either King David or See Wonder. The fall gilts sell open as do the spring gilts. Our readers who are looking for something goodwill do well to check Nos. 1, 4 and 6. The sixteen spring boars are a very uniform, useful lot and several of them are genuine outstanding prospects for herd boars.

This is Mr. Bland's first public sale and naturally he has selected with care and judgment the entire number that are cataloged.

Many of our readers are familiar with Mr. Bland's herd and to those who are not we will say that the Long Branch type of Polands are the well bred, big, quality kind. his sale is one we can urge our readers to attend. The catalogs are now ready to mail and may be had for the asking. Write at once for one and arrange to be at the ringside when Col. Gross starts the selling. R. P. Royce will represent The Missouri Farmer and bids entrusted to him will be handled with judgment and care. Please mention this paper when yo uwrite.

White's Durocs

About ten days ago the writer stopped over at Palmyra, Mo., and visited A. White, Jr., who advertises Durocs in this paper.

Mr. White's herd is in great shape at the present time and can take care of the wants of our readers who are in the market for choice Durocs.

Mr. White has on hand several fall boars that he is anxious to dispose of and in view of the quality and breeding offered he is pricing them worth the money. Two of the boars are sired by Crimson Col. I Am, the junior champion of The American Royal, and are out of the great producing sow, Missouri Lady. Mr. White also is offering about twelve extra good values in fall gilts that are sired by Crimson Col. I Am and are bred for fall litters to Select Col II, the boar now at the head of the herd. Select Col. II is one of the best Duroc boars the writer knows anything about. He is bred in the purple and as an individual few boars can approach him.

A very desirable lot of spring boars and gilts are in offer and Mr. White can furnish our readers with pairs, trios or more of unrelated stock, sired by Crimson Col. I Am, Col. Wonder and other good boars. Write for prices on this stuff.

Bennett Bros. Poland Chinas

Elsewhere in this paper will be found the advertisement of Bennett Bros., Lee's Summit, Mo. We take pleasure in introducing this firm to our readers because we know that their herd is one that deserves the serious consideration of our readers, furthermore we have known these boys, Park and Lewis, for a good many years and they are the kind of men to know. Ever since these boys came to Columbia, Mo., to attend the short course in agriculture, they have been making their plans to enter the business of producing pure bred hogs. Both members of the firm are critical judges of all kinds of livestock and when they made their initial purchases they selected individuals that were counted by all to be among the best sold in several top sales. This firm was the heaviest buyer at John Belcher's record winter sale and secured many of the best sows that were bred to Mr. Belcher's great boar Smooth Columbus. No boar in recent years has attracted more interest from breeders in this section than has Smooth Columbus, and it was the competition among breeders for his get that caused the Belcher sale to make an average of over $80. At this same sale Messrs. Bennett bought the great A Wonder sow, Fessie's Lady, at the record price for the state last winter, $355. Fessie's Lady was carrying a litter by Big Joe, at the time, and several of the boars for sale are from this sow. One boar in particular promises much, and is to be shown at the State Fair this

Clydesdale Horses, Jacks and Jennets

W. C. WATSON. - - - - - - - - NEW LONDON, MO.

fall. Messrs. Bennett are offering Smooth Columbus boars out of sows by Big Sampson, Baine's Wonder and Big Hadley. Among the get of this boar are some very high class future herd boars. They can be bought now worth the money and with right handling will develop into valuable breeding animals. When you buy Smooth Columbus boars you get an added value of advertising publicity few boars can give.

Several litters are by their former herd boar, Baker's Hadley, first prize senior yearling at Missouri State Fair last year, and are mighty good material to pick useful boars from.

We have seen this stuff and know that our readers will be pleased with the kind Messrs. Bennett are sending out at reasonable prices. This firm will have a young herd entered at Sedalia this fall and extend an invitation to all to visit their pens. Among the show stuff that is being fitted is a spring gilt by Smooth Columbus, that is as good as the writer knows of.

The Bennett herd is an outstanding good collection of strictly big type Polands and we take pleasure in recommending this herd to our readers. Everything is immune. Kindly mention this paper when you write.

Missouri Holstein Breeders Organize

"More and better Holsteins for Missouri" is the battle cry of some thirty-odd prominent Missouri breeders who attended the meeting at Columbia, called by E. G. Bennett, State Dairy Commissioner. This meeting was the out-growth of several district meetings called by Mr. Bennett for the purpose of getting the Missouri breeders together in a permanent organization. A very enthusiastic meeting was held and The Missouri Holstein Breeders' Association was launched. P. P. Lewis, Crescent, Mo., president of the state board of agriculture, was elected president; S. C. Lindsey, Carthage, Mo., vice-president; Casper P. Gantz, King City, M., secretary-treasurer. A temporary board of directors was chosen to serve until the next meeting which will be held at Sedalia, during the State Fair.

There is a very keen interest in this state in pure bred dairy cattle. The Jersey breeders organized some time ago and the value of such co-operation is already apparent in the large entries of Jersey cattle at the State Fair this year. Much good will be derived from these associations if they organize and operate along militant lines. Every breeder of Holstein cattle in this state should get in touch with the secretary and join in the good work.

The officers are planning a very practical program and are in a position to render members valuable service. Cow test associations, consignment sales, and community breeding will be encouraged.

White Eagle Chief O. I. C.'s

Beginning with this issue W. P. Doolittle, Woodland, Mo., comes before our readers with his White Eagle herd of O. I. C's and Chester Whites. Mr. Doolittle is no doubt well known to most of our readers as he has been engaged in the pure bred business for years, and his herd has come to be looked upon as first class in every way. The herd takes its name from the boar, White Eagle Chief. Wherever white hogs are bred the name "White Eagle Chief" is a byword. White Eagle Chief is not only a great individual but as a sire he is recognized as one of the most prepotent sires of size, bone and quality. Progeny of this boar will be found in many of the leading herds.

Our representative visited this herd not long ago and was impressed with the splendid fall boars and gilts he saw, as well as nice lot of thrifty, well grown spring pigs. Mr. Doolittle makes extensive use of forage crops in developing his young stuff and the wisdom and practical value of such a plan is readily noted in the White Eagle herd.

Usually Mr. Doolittle holds a fall sale, but this year he has decided to sell his surplus at private treaty. Accordingly he is offering a dandy lot of gilts bred for fall farrow, and the top of his spring stuff. Pairs, trios or more of unrelated stock can be furnished at prices that are very reasonble. When you write or visit this herd please mention this paper.

Thomson Bros. Durocs

W. H. & Geo. E. Thomson, Columbia, Mo., are offering splendid values in Duroc spring boars and gilts. Several days ago the writer visited this herd and he takes pleasure in calling our readers' attention to the advertisement which appears elsewhere in this paper.

Messrs. Thomson are making good their promise of establishing a herd that would rank with the best. The herd was good last year but is considerably stronger this season because of the valuable additions made last winter. Messrs. Thomson own in partnership with R. L. Hill, Col. Wonder II, as good a young boar as will be found in the state, and a boar that is destined to play an important part in the breed's development in Missouri. Most of the spring stuff is sired by this boar, but several litters are on hand by Col. Enough I Am, a strongly bred Col. boar, and by Beauty's Col., by Beauty's Model Top, while two litters are by Col Wonder, C. L. Taylor's grand champion and sire of champions. One of the Col Wonder litters is out of the great broo sow, Miss Crimson Col. I Am, purchase last winter in C. L. Taylor's sale for t long price of $270. This sow is easily o of the most valuable sows in the stat She is an extremely large sow, put up splendid lines, carrying remarkable lengt —in short she is a brood sow possessin to high degree those qualities most sought after by all. Several boars—she farrowed in May—are outstanding good ones and should go to good herds. A gilt in this litter is a plumb popper and will be shown this year.

Thomson Bros. have a lot of other good things for sale at prices in keeping with the quality, and they will appreciate having you investigate their herd before you buy. Remember, everything is sold on a positive guarantee.

McPherson's Durocs

J. E. McPherson, Columbia, Mo., is offering some of the best developed Duroc spring boars and gilts that we have seen in a long time—in fact, we don't recall having seen as much size this year. Most of the offering are sired by Golden Tat by Tatarrax Again, the boar that the College of Agriculture has been using with marked success. If you want size and quality at reasonable prices better write Mr. McPherson early. Such stuff as he is offering will not remain in his hands long. Single pigs, pairs or more, not akin, can be furnished. Write for prices and mention The Missouri Farmer.

Holsteins and Ayrshires

Look up the advertisement of the Galloway-Messer Farms offering choice young Holstein and Ayrshire bulls, heifers and cows. This stock is right in every way. Mention this paper.

R. F. Baldwin's Spotted Polands

On this page will be found the advertisement of R. F. Baldwin, Rocheport, Mo., in which he calls attention to his offering of Spotted Poland China spring boars and gilts. Mr. Baldwin is not a stranger to our readers inasmuch as he has used our advertising columns before. However, it is only this season that he really catches his stride as a breeder. For years Mr. Baldwin has been gradually getting a herd together with the view of entering the ranks of the good breeders.

The herd is headed by King Jumbo 71356, a splendid son of King of All, the noted Lawson boar. Mr. Baldwin purchased King Jumbo from Ed. Cook at Pattonsburg, Mo., as the pick of the litter out of the great sow Jumbo Wonder 2d. We regard King Jumbo as an exceptionally good young boar and judging by the way his pigs are showing up we look for him to prove a very successful sire in the Baldwin herd.

Practically all the spring stuff offered is by this boar and are out of dams carrying the blood of Blaine's Wonder, Big Hadley, Grand Look, Expansion K, Spotted King and Missouri's Best.

The writer visited this herd recently and is glad to call the attention of our readers to it, and to recommend it to those who are in the market for good useful breeding stock. Mr. Baldwin can furnish either black or spotted pigs and will ship out only such stock as he will guarantee to please. Lack of space at this time prevents us giving a more extended notice, but we will have more to say in subsequent issues. Mention this paper when you write.

Splendid Jersey Sale

Attention is called to the advertisement of R. L. Finch's sale of Jerseys at Carrollton, Mo., Sept. 18th. This is a splendid lot of rich producing cows and heifers and is a great opportunity for those interested in this great breed of dairy cattle to secure some bargains. The herd is headed by Eminent's Dairy Boy 104275, son of Eminent 2d, who sold for $10,000, and sire of 80 butter test cows. If interested in the sale, kindly write B. C. Settles, Sales Manager, Palmyra, Mo., for a catalog, and mention this paper.

POLAND CHINA SALE

Centralia, Mo., Thursday, Sept. 16

FIFTY HEAD OF THE GOOD KIND

This is my first public sale and I have selected the kind that I feel justified in asking the public to bid on Included in the offering are 9 TRIED SOWS 6 SPRING YEARLING GILTS, 5 FALL GILTS, 16 SPRING GILTS and 16 SPRING BOARS.

The entire lot represents my best efforts as a breeder, they are sired by KING DAVID 170565—the best living son of LONG KING; LEADER 201105 by GRAND LEADER, and by SEE WONDER the best son of PRITCHETT'S A WONDER I ever saw.

The tried sows and yearlings sell bred to KING DAVID and SEE WONDER.

Sale will be held at Fair Grounds near town.

Catalogs will be mailed to all who ask for one.

An After Thought

A short while ago a couple of fine but stubborn friends of mine fell out over a matter and concluded "to have the law" on each other. Altogether, not over a couple of hundred dollars were involved in the controversy—but if it had been five thousand they could not have been more "het up." Furthermore, both are honest men and as a general proposition want nothing but what is right—once they know what right is. When I heard of the row I tried to get them to agree to a compromise but neither would listen. In due time, both consulted a lawyer. Smith's lawyer promptly agreed that they could easily "beat Brown" while Brown's lawyer filled up his pipe, leaned back in his chair and as he emitted a cloud of long green, complacently assured him that they would "mop up the Earth with Smith"—and so I suppose in due course the fur will fly.

Now, of course, Smith and Brown cannot both be right in their contentions and inevitably one or the other must lose the suit—or possibly there will be a compromise verdict in which both will have to give and take and pay lawyer's fees and a lot of court costs besides. That the two lawyers in question understand both the law and the justice of the conflicting contentions I have no doubt because they are both able, well read barristers. But they make their living out of the quarrels and disagreements of the public. If Smith and Brown got together and compromised their differences out of court there wouldn't be any lawyer's fees. And since lawyers are normal human beings like the rest of us we cannot expect them to assault their own pocket books. Practicing law is no more philanthropy than banking, farming, merchandising or mending shoes. But the fact remains that our present system of legal jurisprudence is a direct bid for legal controversies and the fees which flow from these controversies are the very foundation upon which much of the structure rests. That there are lawyers who frankly advise their clients when they are in the wrong is of course true—but they are the exception and not the rule. As a general proposition they hang out their shingle "to do business" and to give everybody a "run for his money"—and hence, when the day of trial comes they glare at each other with mighty and profound mien, roar like the lions of the jungle, read long passages of precedents and statutes—and then finally, mopping their learned brows they sit down with an air which inaudibly says to their clients, "I've done my blamedest. If you get skinned now it ain't my fault."

As I contemplate this system the thought comes to me, why should there not be in every county a high class judge of the caliber and legal learning of the average circuit judge and why should not such a judge have jurisdiction over a great share of the legal problems which come to pass? Then when Smith and Brown disagree about some matter, why should they not be able to go to this judge and explain their differences and after he has patiently heard both sides, let him deliver his decision—and thus not entail a penny of lawyer's fees or court costs upon the parties to the quarrel? I don't mean that the right of appeal to a higher court should finally be denied or that such a judge should have jurisdiction over the graver crimes and controversies which now and then arise—but in my humble judgment a county judge clothed with this power would automatically shut off 75% of our present court costs and at $3000 per year in salary I am confident he would affect a tremendous saving for both the county and the state—saying nothing of the money and vexation saved for litigants.

After all, under the present system the circuit judge is the legal umpire with reference to the controversies that come before him. After the rumpus and tearing of hair is over he delivers the instructions which guide the jury—so why not have a learned judge in every county to whom men and women can submit their differences without the cost of a penny? In nine cases out of ten his verdict would be accepted. Would not such a system tremendously simplify justice and would not both rich and poor have an equal opportunity in such tribunal? It may be "lese majeste"—but anyway, the thought has occurred to me.

—By the Author of After-Thoughts.

MAKE ROAD MAKING A BUSINESS

Dear Editor The Missouri Farmer:

Since I can remember we have been resolving and legislating on good road propositions and have made very little advancement.

We have architects and other competent men to construct buildings, why not have good engineers and others that can make road work their business to build our roads?

We have had as good men as the country affords for road overseers but they have all been handicapped owing to the fact that they can't get men and teams at the proper time for it is necessary for farmers to be in their fields and the overseers can't do more than touch the roads up to last one year, doing no permanent work to build on in the future. I'll admit there have been some concrete culverts made but very few planned so as to grade to in the future, therefore, we can not expect to get anything permanent unless a radical change is made.

I suggest that our law makers study the road question seriously and intelligently and make a law that will enable us to lay a foundation that will not have to be torn out but one that can be built to year by year in all time to come. We have had and will always have men competent to make this law if they could just leave out self and work to the best interest of the state. I think all are willing to admit that this grand old state is entitled to better public highways and in my judgment I feel sure this can be done if we can have a practical engineer to supervise the work. Some might say that one man can't supervise the road work of a whole county. I think he can, if he can have good men and teams in different parts of the county as he thinks best.

I do not expect to live to see this completed but hope to witness the beginning of the work on a basis when completed it will be an honor to the state.

I hope there will be no further legislation on roads without a fixed purpose in view. C. C. Turner.
Browns Station, Mo.

A GOOD ROADS BOOSTER

The Missouri Farmer: I have read the article by Judge Turner in your valued paper as to a change in our road system in this state and I can heartily endorse what he says. Our present road system will never benefit our roads but very little. Our people are waking up as to the importance of good roads and they are generally becoming very enthusiastic as to immediate action of some kind to guarantee Missouri good roads in every county in our grand old state. This is becoming the burning issue throughout this land and the people have for the first time begun to realize what a very great benefit good roads will be to each and every farmer and business man or any other citizen, no matter where he lives. To solve this good roads proposition no doubt it will be taken up by our state and national governments soon and laws will be passed that will in the near future guarantee to the citizens of every state and county a better and a more efficient system of making good roads.

Some suggest one thing and some another as to the best and most efficient and economic way to build and maintain good roads. It all has resolved itself into one question, how are we to raise the necessary funds to do this road work and buy all the necessary machinery—the very best type and that which can do the quickest, cheapest and best work.

A Guaranteed Worm Expeller
GILBERT HESS, M.D., D.V.S.
Worms are responsible for nine-tenths of your hog troubles at all seasons of the year, but especially in the fall. Do not be misled, thinking your hogs have some other ailment. Nine times out of ten their trouble is worms. My Stock Tonic will positively expel these worms and keep your hogs in a healthy condition, thereby enabling them to resist disease and lay on fat. Feed my Stock Tonic to your hogs right now.
Dr. Hess Stock Tonic
Makes Stock Healthy—Expels Worms
25-lb. pail, $1.60; 100-lb. sack, $5.00
Why pay the peddler twice my price?
It isn't enough to rid your hogs of worms, mark you. You must also tone them up and put them in such a clean, vigorous condition as to make worm development impossible. That is why my Stock Tonic not only contains vermifuges to expel the worms, but it also has in it tonics, blood builders and laxatives to build up and regulate the animal's system.
My Tonic is highly concentrated, as the small dose quantity will prove, and as I have no horses, wagons and salesmen to pay for, I can sell you at rock-bottom prices through your local dealer.
My Stock Tonic also aids digestion and assimilation, makes your hogs and other stock thrive; it is the result of knowledge which I have acquired as a veterinarian, doctor of medicine and stock raiser. Formula on every package.
So sure am I that Dr. Hess Stock Tonic will keep your stock healthy and expel worms, that I have authorized my dealer in your town to supply you with enough Tonic for all your stock and, if it does not do all I claim, just return the empty packages and get your money back.
25-lb. pail, $1.60; 100-lb. sack, $5.00, smaller packages as low as 50c (except in Canada and the far West and the South). Send for my free book that tells all about Dr. Hess Stock Tonic.
DR. HESS & CLARK, Ashland, Ohio
Dr. Hess Poultry Pan-a-ce-a
A splendid tonic during the moulting period. It gives the moulting hen vitality to force out the old quills, grow new feathers and get back on the job laying eggs all winter. It tones up the dormant egg organs and makes hens lay. Also starts the pullets to laying. Economical to use—a penny's worth is enough for 30 fowl per day. 1½ lbs. 25c; 5 lbs. 60c; 25-lb. pail, $2.50 (except in Canada and the far West). Guaranteed.
Dr. Hess Instant Louse Killer
Kills lice on poultry and all farm stock. Dust the hens and chicks with it, sprinkle it on the roosts, in the cracks and dust bath. Also destroys bugs on cucumber, squash and melon vines, cabbage worms, slugs on rose bushes, etc. Comes in handy sifting-top cans, 1 lb. 25c; 3 lbs. 60c (except in Canada and the far West). I guarantee it.
For every 2 hogs, put one tablespoonful of Dr. Hess Stock Tonic in the swill twice a day and I guarantee it will get the worms.
If you have sick or injured animal, write me giving symptoms and I will send you prescription and letter advice free of charge. Send 2c stamp for reply.

Most people are of the opinion that the quickest and best way to raise the necessary funds would be by direct taxation and by forming special road districts, as the law provides, and issue 20-year bonds. I am a good roads booster day and night and at all times and places, and I am living in hopes that we may soon be able to build fine roads throughout every township and every hamlet in this state. Let this good work go on and on until good roads are a reality in Missouri

I think there is a general tendency to crowd all the roads by setting fences in on all these roads and some now are very narrow and no space to ditch our roads as they should be. This practice should and ought to stop and all should be compelled to move back and give the full distance for each and every road. There is also another practice that is bad for our roads, that of changing the road to other places and oftentimes very rough and hilly land, and a good road can never be had.

Dr. H. J. von Gremp, Dixon, Mo.

TAKES MONEY TO BUILD ROADS

Editor Missouri Farmer:

I see you are asking the farmers to write you their views on the subject of Better Roads. In the first place, it is very discouraging to try to do something without anything to do it with. A few years ago we had a property tax for roads that could be levied and collected in labor and the road work done near the land on roads the farmer was interested in. Some smart Alec introduced a Bill in our Legislature and had this law changed so the tax was paid in money. Now, the road money is collected and spent on a few main or automobile roads. Other roads including rural mail routes are neglected. The automobile tax money is put on a few inter-county seat roads and men hired to drag them. The dragging is done indifferently, one round at a dragging and soon there is a ditch inside the main ditch and the road is cut down to sixteen feet wide.

I am opposed to any law showing favoritism to farmers because they happen to live on a road leading from one county seat to another. Our farmers are donating work and money the renters doing their part of it and we are doing this to improve our roads to get to school, to church and to town.

I favor a uniform width of road of forty or fifty feet. Then levy a poll tax of $2.50 on able-bodied men and a land tax of 40 cents an acre running for five years. Then on personal property where the owner pays no land tax a levy of 40 cents on the hundred dollars valuation and at the end of the five years reduce the rate to just what may be needed to keep the roads up. When the money is paid in to the county superviser or township trustee let him have the work done and thus relieve the farmer of loss by being taken from his fields when the crop need working.

I give this as a suggestion for a plan I think is better than what we are now doing. G. B. Weaver,
Harrisonville, Mo.

There have already been several frosts in Wisconsin and other Northern states and their seed corn supply will be cut short. Missouri farmers better take warning and gather their seed now.

Grades Roads Levels Land
Ditching Made Easy
With the Martin Ditcher and Grader
Cuts V-shaped ditch up to 4 ft. deep. Fine for levee work; terracing; cleaning out laterals and bed furrowing.

The Missouri Farmer

VOLUME VII SEPTEMBER 15, 1915 NUMBER 18

Modern Systems and Practices of Swine Management

L. A. Weaver, Assistant Professor of Animal Husbandry, University of Missouri

High priced farm lands, which as a ule are less fertile than formerly, are emanding that more attention be aid to modern methods of farming. f agriculture is to be permanent, then he fertility of the soil must be, at east, maintained if not increased. In rder to economically keep up this ertility, it is a recognized fact that ome kind of live stock must be kept. The demand of the meat eating public nakes it imperative that a large part f the live stock produced on the farm e cattle, sheep or swine. The kind f animal to be kept is determined by good many different factors of which the following are some of the nost important:

First: The kind of farm, or in other vords, the kind of food available. It s easily understood that no man could row hogs profitably on the large razing areas of the west or on any arm where grain could not be readly supplied. As a country develops, he beef and sheep industry gives way o a certain extent to the dairy cow nd hog for the reason that dairy and ork production adapt themselves bter to intensive farming than does the roduction of beef or mutton.

The Hog Makes Economical Use of Feeds

The next thing to be considered is he relative efficiency of the various nimals for utilizing the feeds grown n the farm. No other meat producng animal, with the possible exception of very young lambs, will make s economical use of food given as vill swine. This is shown by a table iven in Jordon's "Feeding of Animals," the data of which was obtained rom the recorded data of experiment tations involving a number of obserations and hence should be reliable or average conditions. A part of the able follows:

Kind of animal	No. of experiments	No. of animals	Digestible organic substance to produce one pound increase in live weight
Steers (avg.)...	32	242	7.40
Sheep (avg. for sheep and lambs)	11	122	7.20
Swine (avg.)...	277	1,385	3.29

If the above results are trustworthy, t is seen that a little more than onehalf as much digestible organic matter is required to produce a pound of gain in live weight of swine than in case of cattle or sheep. (In this connection it is conceded, however, that cattle and sheep are able to utilize a greater amount of roughness than can the hog.)

Nor does the food required to produce a pound live weight tell the whole story. Another part of this same table shows the food requirements to produce one pound increase in carcass and also the requirement to produce one pound increase in edible solids.

	Digestible organic substance producing	
	One pound increase in carcass	One pound increase edible solids
Steer	12	36.3
Sheep and lambs.....	14.2	37.9
Swine	4	6.4

This table goes to emphasize the fact which we already know, i. e., that swine will dress out a much higher per cent than either sheep or cattle and also that a larger per cent of the swine carcass may be utilized for human food. So far, then, as economy of production is concerned, we see much in favor of swine when compared with cattle and sheep.

Capital Needed Relatively Small

A third consideration, as to kind of animal produced, would probably be the supply and demand. In other words, we must be able to obtain the animals which we can finish into a marketable product and must have a demand which will enable us to sell the finished product at a price which will give us a profit. Owing to the prolificacy of swine, there is no class of animal which is easier obtained. A small number of brood sows will produce a large number of animals to feed. The capital needed in order to start in the business is for this reason relatively small As to the demand for the finished product in the past statistics show that pork has sold for as high or higher price per pound than either beef or mutton. The facts already given show this to be the logical result. Pork is getting to be more and more the meat used by the working class of people and for this reason we may conclude that the demand for pork will continue.

The kind of animal to be produced is also determined, more or less, by the present prospects of the industry. Probably the greatest drawback of the industry in the past has been the dreaded disease of hog cholera. Since much progress has been made in the last few years in methods used to control this disease, it would seem that it should be only a question of time and education until the danger from hog cholera should be reduced to a minimum.

By the facts already brought out, namely: the trend toward intensive methods of farming; the economy of production, including both the cost and the food value of the product, and the demand for the finished product it is shown that there are some fundamental reasons why the swine business is profitable compared with other meat producing industries.

As a country develops, land increases in value and it becomes necessary to change the systems of farm management and farm practices. It has been shown that pork production is profitable. It is not, however, as profitable as formerly unless modern systems of management are followed. For example: Conditions were formerly such that it was profitable, as well as desirable, to market extremely heavy hogs. In the case of swine, however, as well as with other meat producing animals, early maturity and short feeding periods are now the rule so we find few prime heavy hogs (350 to 500 pounds) reaching the market. It is only by adopting the system of management to changing conditions that the hog feeder can make the most out of his operations.

Three Systems of Swine Management

Owing to the different kinds of farming there are several more or less well defined systems of swine management, each requiring to a certain extent, its own specific practices. For example, a system which is well adapted to farms having good equipment and on which is grown a large amount of grain, is that of keeping on the farm a breeding herd large enough to produce all the pigs needed for feeding. These sows are bred to produce, as nearly as possible, two litters a year. The pigs produced in this way should be crowded from birth and are marketed at from 6 to 8 months of age, at 200 to 250 pounds.

A second system is that of raising but one litter a year and having this litter come during the late spring. The sows and pigs are on forage of some kind for the grazing season with perhaps a small amount of grain in addition. The pigs are in this way grown, rather than fattened, until fall. At this time they are large framed, muscular hogs and are put on feed and finished for spring market at the age of 12 to 14 months.

A third system, practised by some, is one very much like the second except that the hogs are on pasture with little grain during the first summer, are fed a growing ration during the winter and during the second summer, or when the hog is a yearling, he is provided forage crops such as alfalfa, clover, rape, etc., and grain enough to finish him by the end of the grazing season. These are marketed in the fall at a weight of 300 pounds or more.

Other more or less distinct systems might be mentioned. Each has its advantages and disadvantages and the one practiced depends very much upon local conditions. The best system for one man may not be the best for another. The system best adapted for a given individual one year may not be the best for the year following. It is impossible therefore to say that any one system is best for all conditions.

Regardless of the particular system of swine management which is practiced, however, certain principles must be kept in mind and followed in order to make risk from disease small, cost of production low and selling price as high as possible.

Professor L. A. Weaver

One of the first principles which should be observed with any kind of live stock, in order to advance, is that of handling improved types. Many years of breeding a type, for a particular purpose, has resulted in the production of animals which are more efficient machines. The improved dairy cow, for example, is a more efficient producer of milk and butter than is the unimproved animal. She can take the raw product and from it more economically produce milk and butter. The same thing is true of meat producing animals. Years of breeding has produced a type of animal which will make a much more valuable carcass with no greater cost.

The profit made from pork production is the difference between the cost of producing the hog and the selling price. The improved type of hog is highly developed over the back and loin, is heavy in the hams, is light in offal, etc., and hence commands the better price. In order to increase the profits then, a better type of hog should be used. It is not enough to simply make pounds of pork but it must be pork of the right sort.

Generally speaking, it is profitable to produce on the farm the pigs to be fattened, since this gives the feeder much greater control over the type of animals handled. Better sires and dams mean that the offspring will be a better type of pork hog. It is very important that great care should be exercised when selecting the sire since this influence for good or bad, in the herd, is relatively much greater than is the case with a single dam. The dams should, of course, be of the best type which one can afford, but it is apparent that where polygamus mating occurs that it is good business to improve the herd through the sire, rather than through the dam.

ARE WE GIVING THE PEOPLE WHAT THEY WANT?

Sometimes we do not know altogether what we want or what may be best for us. Sometimes we may have a big problem on our hands and not know it. The other fellows think they know what we need, and what is good for us, and they attempt to apply a remedy but we will not stand for it, unless we see the need for their medicine. Common "cure alls" do not go down us as they once did.

I am referring in the foregoing to farmers and instructors in agriculture. In all the years too many of us farmers have not seen that we needed agricultural medicine, and too many instructors, while they may have known we were sick, either did not know the brand of sickness or if they did they did not apply the right medicine, or they gave it in wrong doses in the wrong way. Gave us a small pill but required us to take it in a bucket of water, and our capacity for water was too small, so we balked.

Too much of the time the farmer and the agricultural instructor, or institute lecturer, or what ever you may want to call him, have viewed a problem from different angles, and usually reached unlike conclusions, and unless they can see from the same viewpoint they are not likely to get together in a solution. Too often the speaker and writer, seemingly to appear wise, use terms that are as "Hebrew" to the average listener. When the hearer does not understand the meaning of every work a speaker uses the "chain is broken" and his interest is lessened, and the speaker has to that extent wasted "ammunition." Too many "farmers' bulletins" are largely "Latin" to the farmer. It may be true that all the farmers should know the meaning of the terms used in farm talks and bulletins, but the facts are that they do not and neither does anybody else without a reference once in awhile to the dictionary. We cannot deal with these things as we would like them to be but we must handle the conditions as they exist. A few varied experiences will help to make my meaning clear.

Not long ago I made a first visit to a place for making a speech, and I could not get attention until I spun a few jokes. Then I said a few mean things ,and gave them some real "rough stuff." When I once had attention and launched into my farm talk, the crowd stood for one hour and listened and at the close asked me many questions and they want three days next year. The trouble was in the beginning that they did not have the same viewpoint as myself but when we all got on the same track going in the same direction we "got somewhere."

In some cases I have signally failed to accomplish any visible results, and largely attribute the reason for this that at the start we did not get a mutual understanding of each other.

At Columbus Junction, Iowa, where I talked for one hour and gave them thirty minutes for asking questions, they were not satisfied to stop, but we had to give way for a 30-minute number to follow, and when that was done I was called back for another half hour to answer questions. The same happened on two other occasions. At Lincoln, Ill., I had only one hour, and of that I talked fifty minutes and had but ten minutes for questions, as I left the platform one man asked me if I could give him some time as he wanted to ask me more questions. I consented to do what I could for him. So we went about fifty yards away to a building with seats in it, and by the time we were started not less than twenty-five men were in my new audience. We had a conference lasting three-quarters of an hour longer and they asked me if they could make arrangements with me for next year for one week with a farm talk each day.

At one Missouri point where at least 2000 were present, the "main show" lasted one hour, questions forty-five minutes. When I went a mile into the country to take supper with a friend and within fifteen minutes after my arrival the telephone rang and two men wanted to see me to ask me further questions. I gladly welcomed them and a pleasant talk of perhaps ten minutes followed. I want to just mention incidentally that in my opinion not one of these ethusiastic farmers is a failure on his job and I know that not one of them is a blamed fool.

I mention these meetings to show how successful we may be in some places and how we fail in others. In the one case we no doubt give the farmer what he wants in the way he wants it and in the other maybe we do not know what the farmer wants nor how he wants it, and we sometimes think that many of us do not in reality know what is for the best. To know what the farmer wants and how he wants it is one of our biggest problems, and when we do get the answer iti makes all concerned feel mighty good.

Sam Jordan.

THE GREAT ST. LOUIS FAIR

The good old City of St. Louis is to be congratulated; a new organization of live business men has taken hold of the matter and is now bending every effort toward the completion of all necessary arrangements for putting on a new and up-to-date Agricultural Fair the first week in October. Some idea of the magnitude of the undertaking is indicated in the fact that they have leased one hundred and fifty acres of land as a fairground just outside the city on the St. Charles Rock Road, where extensive improvements, costing over one hundred thousand dollars have already been made including a large concrete grandstand and a beautiful mile race track, known as the Maxwelton Track. More than twenty acres of this ground will be covered with an exhibition of farm machinery. The Tractor Show and Demonstration alone will draw many enterprising farmers to this fair.

A number of men connected with the enterprise are well known in business circles and among livestock exhibitors. Col. Paul Brown, the wealthy broker and horseman, the owner of Johnnie Jones and My Idol, two of the best in the Missouri Saddle Ring, is one of the prime movers in this new enterprise and is vice-president of the company. Col. D. S. Stanley of the United States Army is the enthusiastic and active head of the Executive Committee. Mr. John T. Stinson, the Secretary and Manager of the Fair, was for seven years secretary of the Missouri State Fair at Sedalia, and is known to all the stockmen of this and surrounding states. Mr. Fletcher R. Harris, one of St. Louis' wide-awake real estate men is the Treasurer, and one of the most enthusiastic workers for the Fair. Among others who are actively pushing preparations for the coming event are Dinks L. Parrish, the owner of Belle Beach; Mr. Adolph Boeckeler, the lumber man, one of the live wires of St. Louis; Mr. Henry Steinmesch, one of the leading Poultry raisers of Missouri. Mr. A. L. Shapleigh, one of the live business men of St. Louis, is an active worker on the Finance Committee. Mr. Richard McCulloch, head of the United Railways, and Mr. A. C. Einstein of the Union Electric Company are also enthusiastic members of the Board of Directors.

Mr. Wade Childress, president of the Columbia Transfer Co., another live wire in business circles, is also one of the directors and an enthusiastic worker for the Fair. Mr. James E. Hereford, president of the Trust Company of St. Louis County, is President of the Fair Association and is well known in business circles. Hon. W. D. Vandiver, Assistant United States Treasurer, is another enthusiastic promoter of the Fair, as one of its vice-president. Porter Taylor of Montgomery City is Superintendent of Grounds, and now has a force of men at work getting the track and grounds in proper condition. Mr. Merritt Marshall., Jr., an experienced horseman and E. F. Bisbee of the National Stock Yards are both active supporters and directors of the Fair. Mr. James A. Houchin of Jefferson City, the owner of Astral King is also one of the Fair boosters and Mr. William Hirth, Publisher of The Missouri Farmer has shown great interest in the movement. Altogether, a large number of public-spirited gentlemen are devoting their time and energies to the making of a great Agricultural Exhibit, which is to be a permanent annual event for this great Metropolis of the Central West.

Another indication of permanence and prosperity of the undertaking is the fact that nearly all the banks of St. Louis, all of the big daily newspapers and most of the big mercantile establishments have taken hold of it in earnest. The Retail Merchants Association have taken one-tenth of all the stock of the company and the railroads are showing great interest in it by advertising it in a thousand or more of the country newspapers and sending out a quarter of a million circulars to be distributed through their local agents. The Mayor of the City has declared Big Thursday of Fair Week a Municipal Holiday. All the city offices will be closed and the business houses will be asked to close up also and all attend the Fair. It is probable the public schools will close for the Fair on Monday. The Automobile Show, the Veiled Prophet's Parade and the Buy-in-St. Louis Show will all come in this week. Verily the FAIR WEEK is to be the BIG WEEK of the city of St. Louis this year and the farmers of Missouri are cordially invited to take two or three days off, bring the "whole family" and have a good time before "corn shuckin" begins.

One thing that is exciting much interest is the Five Hundred Dollar Stake for Mule Colts. This is expected to bring the best mules of the country to this Fair. Five herds of dairy cattle are already entered for the Fair and others are expected. Also a big lot of sheep and hogs are to be on hand. The Chicken Show bids fair to be one of the finest in the country.

Possibly the biggest thing on the program is the great Three Thousand Dollar ($3000) Saddle Stake divided into five sections: Stallions, Geldings, Mares and Juniors, $500 each, and Champions $1000. This is perhaps the largest saddle stake in the world this year and is expected to be a sensational event. The Women's Clubs of St. Louis are to have a tent at the Fair, and they are giving great assistance in making the New St. Louis Fair rival or surpass the glories of the old Fair, which was for many years the great autumn attraction and brought many thousands of country folks to the Mound City.

Johnny Jones, one of the great show hor ses expected to be at the St Louis Fair

THE BANKER AND THE FARMER

We often see what some one has said that cannot be too often repeated and the following editorial in the September issue of Successful Farming is worth repeating:

The Banker-Farmer Conference

In an editorial last month, mention was made of a banker-farmer conference to be held in Chicago, July 7-8. It was a splendid program and the spirit of co-operation manifested there was good to see.

You may wonder, as did the editor and others, why the bankers are taking such an interest in the farmers that they should call such a conference. We have learned by experience that almost every effort put forth by politician, business concern or class of individuals, to benefit some other person or class, has back of it the element of self interest. We would not condemn this. We need only to recognize this element in human nature.

The bankers have come to see at last that they stand in a strategic position in relation to country life. They can make or break any community. Some bankers are Shylocks, and bleed the community of every dollar they can and give nothing back. But do not condemn all bankers because there ar some who do not have the broad community interests at heart.

The conference disclosed the fact that the better class of bankers are very deeply concerned in the upbuilding of country life. They want to lend all possible aid to the farmers who are worthy of aid. Some bankers lend money without interest to farmers who will build silos. Others will lend money at low rates for the purchase of live stock, alfalfa seed, or things they consider essential to good farming.

The bankers as a class are good level headed business men who know just how each farmer is succeedi They can often advise wisely against foolish investments or supposed improvements, or suggest ways of making the farm pay better returns. Mos country bankers are well read along agricultural lines and it is folly to think that because they wear white collars and sit in an office they know nothing of value to the farmer.

We will continue to have the loan-shark banker as we will continue to have the dead-beat farmer, but let not your minds be warped into thinking that these represent either class. They do not.

Among bankers the same as among other human folks there are the "wide" and the "narrow" ones. There are those in every class who consider self interest in the narrowest possible way, and those who see self-interest in a broad way.

The one sees self interest in filching

from others all he can get, and the other sees self interest in the welfare of his community. One sees or recognizes the principle of the brotherhood of man, and the other does not and does not count that he owes anything to society, and the other sees that society is all that can make him anything. One builds up, the other tears down, and as a class none see the principle of community interests more clearly at this time than does the up-to-date, wide-awake banker.

It has been my very great pleasure to have been among bankers in their meetings and associations for several years, and with very few exceptions they are anxious to lend every possible aid to community betterment.

If he were prompted alone by self interest let's analyze the situation and see if from that standpoint alone if no other he would be amply ustified.

A part of his business is to receive deposits. Since from these deposits he secures his greatest revenue, if the community is not prosperous that community does not have much money to deposit, hence his revenue for the bank must be cut short.

Listen! If the bank's loans are good the institution is safe and the quality of its loans depends upon the way the borrowers discharge their obligations, hence the bankers want us to have good credit by being prosperous. Now, "honest Injun" what do you think of a "feller" who does want to "get along"?

We get most of our six billion dollars of farm loans directly or indirectly through bankers. We get nearly all of our enormous personal loans through bankers and if we who borrow fail the banks must fail. So if we give him no credit for anything but self interest he is justified because that self interest helps the banker, the depositor and the borrower.

Sam Jordan.

THE BROOD SOW

The success of the prosperous hog breeder is due to the wise selection of the brood sow, as well as the wise selection of the herd boar.

In selection of the individual animal, there are a few points to consider. In general appearance, the sow should be fairly low set, good length, good constitution, deep bodied, strong back and symetrical throughout. She should stand square on strong feet and legs. Her head should be refined, indicating quality and present a feminine (breedy) appearance. The shoulders should be broad, deep, smooth on top and well fleshed. The back should be strong, slightly arched and with well sprung ribs. The loin should be wide, thick and strong. The sides should be long, deep and smooth, free from wrinkles. The rump should be broad and well carried out (not too drooping). The hams should be wide, deep and well filled down to the hocks. The legs should be straight and have quality and substance combined.

Other things besides individuality must be considered. One of the most important characters of the brood sow is fecundity, that is, the bearing of large litters. It costs just as much to winter a brood sow that produces three or four pigs in the spring as it does to winter one that will produce eight or nine. In selecting the brood sow, it is well to select those from large litters and whose mothers and grandmothers were from large litters.

After the first crop of pigs are weaned, the poor mothers and the sows that produced small, runty litters should be culled out and sent to the butcher.

Good sows improve for a number of years in the number and size of pigs they produce to the litter. At the Wisconsin Experiment Station, yearling sows averaged 7.8 pigs per litter with an average weight of 14.2 pounds per liter, while sows from four to five years old averaged 9 pigs per litter, with an average weight of 26 pounds per litter. The United States Department of Agriculture compiled the records of over six thousand sows and found that yearling sows averaged 6.65 pigs per litter and five year old sows averaged 8.4 pigs per litter.

The practice of some farmers selling their old brood sows each year and replacing them with immature ones is a bad one, as the older sows are better mothers and produce larger and stronger litters. C. W. Hickman.

Idaho Experiment Station.

THE FARMER'S SALARY

The farmer sometimes thinks his salary is too small and I have been one of those who shared in that belief, but if we are to remedy the trouble we can hope to reduce the wages of laboring men nor the profits of the average business man, but it must come by reorganizing and simplifying methods of distribution and marketing. Then there is need of reform in official salaries, methods of controlling public expenditures and stopping so much speculation and the parasitic expense taken by a class of middle men who are not needed and who render little service to society.

But while we are working and waiting for these reforms we should not become too easily discouraged with our business and quit farming and look for something better. The man in town who does not own his property will find the monthly rent bills coming in all too often, particularly if the weather is bad or times are slack and he is out of work. Then on the farm a big part of the family living comes from a well cultivated garden and orchard. If the farmer wants to take his family to church or for an outing a few miles away he does not have to pay a livery or garage bill of five or six dollars as nine out of ten men living in town would have to do. A salary of $1000 to $1500 may look big to the small farmer who does not sell that much grain and live stock off the farm in a year, but if he will look over the expense bill of the family in town he will find that the farmer has had more fresh fruits and vegetables on his table, more fresh eggs and fried chicken to eat, a much greater use of horse and buggy or automobile and while at the end of the year his bank account may be no bigger than it was at the beginning of the year his neighbor in town is in the same fix, minus the good things enjoyed during the year.

SOME MONEY SAVERS

Occasionally you will see a good rustling fellow but some how he just can't get ahead very fast. A close observance of this class of men as a rule will show a lot of little leaks in their system of doing business. It may be that a gate to the corn field has a broken hinge that a 25-cent hinge and twenty minutes work would make good, but it is just neglected until some night the stock break in and possibly a $200-horse is foundered and practically lost so far as any future value is concerned. Keeping the barn doors, gates, fencing, well covers and everything about the farm in shape will not only add to the daily convenience of things but it will save actual money loss in very many ways.

A few months ago a swine raiser had cholera among his hogs and neglected to quarantine the sick ones from day to day and to vaccinate the well ones, and finally in six or seven weeks the last hog on the farm died. A short time ago he cleared up the hog lots and stocked up again with some nice brood sows. An old strawstack standing back in the field was overlooked, but as a pig had died there of cholera the live cholera germs were still there and in a few days cholera broke out in the herd. Had that old strawstack been spread upon the fields at the proper time it would have enriched the land and perhaps this second outbreak of disease and the consequent loss would not have occurred. Old strawstacks are eye-sores on any farm, are harbingers of disease germs and some crop pests like grub worms and army worms, and the best plan is to work them into the manure supply during their first winter. A half filled silo is a good thing to hold over but an old strawstack, never.

In a day a man ought to go to the field and gather enough seed corn to plant forty acres or more and have time enough to string it or put it in a rack and get it in the dry. A gain of five bushels per acre is a small estimate for the difference between good and poor seed. Two hundred bushels of corn for one good day's work, but how many farmers will have their seed corn put away before the first freeze this fall?

A few weeks ago a farmer called a representative of the experiment station to vaccinate his hogs. When the veterinarian arrived on the farm he found that twenty hogs were already dead and a number more very sick and only about twenty head not yet visibly affected. These twenty head were at once inoculated with serum and fifteen head came through all right. It would have been a big money saver for this farmer had he called the veterinarian and had his hogs vaccinated the day the first sick pig was discovered.

If you are not entirely satisfied with the roads and with the way the road and bridge funds are employed just sit down and write us your views. If your district is doing some good work we would be pleased to get that so that others may benefit by it. We think the question of getting good roads to reach every farm home is our greatest problem.

Meet Us At Sedalia State Fair Sept. 25 to Oct. 2nd
St. Louis Agricultural Fair Oct. 4-9

The Light "All Work" Tractor

Pulls 3 Plows Easily

A Four-Wheel Tractor Dependable as a Horse

Tried out at all the tractor demonstrations above, with results that proved satisfactory in every instance, and added many more names to our large list of satisfied customers. A simple, durable, powerful machine selling at a price you can easily afford. Equipped with four-cylinder vertical engine, 5x6, developing 25 h. p. at the belt, 12 h. p. at the drawbar. Two-speed transmission working in oil, automobile type front axle, roller-bearing rear axle, steel gears thoroughly protected from dust and self-oiling, radiator and fan that cool absolutely. 16-inch-face rear wheels, weight 4500 pounds.

Our ten years' actual experience in building gas tractors gives to the farm owner of the country the assurance that in buying the above machine he is getting a tractor that is not a freak, nor one that is in the experimental stage, but a machine built along practical, sensible lines, giving guaranteed results, assured by the numerous machines at work in the fields today.

ELECTRIC WHEEL CO., Box 46a Quincy Ill.

FUEL SAVING WITTE ENGINES

Kerosene, Distillate, Gasoline, Gas
SOLD DIRECT FROM FACTORY. 5-YEAR GUARANTY
2 H-P $34.95; 3 H-P $52.50; 4 H-P $69.75; 6 H-P $97.75 8 H-P $139.65; 12 H-P $197.00; 16 H-P $279.70; 22 H-P $359.80. *Portable Engines Proportionally Low.*
Prices F. O. B. Factory.

Besides lower price, WITTE engines use **less fuel** per H-P hour—from one-fourth to one-third less—enough saving in a year to pay entire cost of engine. Easy starting; **no cranking.** Our 28 years engine building makes this higher quality for you, at a small one profit for us. Used for all kinds of work.

New Book Free Write us, so we can send you by return mail, full information.

SIMULTANEOUS VACCINATION AND "BLUE RIBBONS"

J. W. Connaway, D. V. S., M. D., College of Agriculture and Experiment Station, University of Missouri.

The advice I gave several weeks ago in regard to the dangers and disadvantages of "simultaneous vaccination" to the breeder of pure bred swine, was so well received by some of the best breeders of the country who have weighed that system in the balances of personal experience and found it wanting, that I feel justified in writing again to sound a note of warning to prospective swine exhibitors who are fitting show stuff for the state and county fairs.

There is now appearing in some of the farm journals a very attractive full-page illustrated advertisement of an Indiana Hog Cholera Serum Virus Company urging the breeders of pure bred swine who are preparing show stuff for the state and county fairs to **"immunize all their hogs before they take chances at the fair."** The advertisement says that even though your exhibition stock may be immune, they may transmit the infecting germs to the non-immune hogs at home. They therefore urge the breeders to have **"the veterinarian vaccinate every hog on the place"** with their serum. Which they say is more expensive but better than that of their competitors—(although the latter have the same Federal inspection and license). They say that "breeders of prize stock everywhere are taking this precaution" (?) "The season of hog cholera follows fast after the season of county fairs and harvest homes." "Take no chances (says the advertisement) but have your hogs vaccinated **now** with (the advertising company's serum", etc., etc.

Now I am hoping that the attractiveness of the advertisement and the scare-phrases it contains will not cause any breeders to do anything so foolish as he is advised and urged to do by this Hog Cholera Serum-Virus Company.

No old breeder who has had show experience will be caught by this advertisement. But the young breeder who is making his first try for the "blue ribbons" may be caught in the trap.

The promoters of the company who are running this advertisement are simultaneous (serum-virus) propagandists, and they are using all the advertising arts and tricks to promote their business, and to bring the simultaneous method into larger use; but they evidently know very little about the hog breeding business, and about fitting hogs for show, otherwise they would not have urged the course of action they did if they expect to gain and hold the confidence and good will of swine breeders.

Every old breeder knows that the time is too short between now and the opening of the fairs to make hogs safely immune by the simultaneous method, and to get their hogs in "show condition." And there is not one who would take the risk of knocking off the "show bloom" by injecting hog cholera virus into a prospective prize-winner that is already in show condition, because hogs in this high condition are less resistant to the effects of the virus.

There is no veterinarian no matter how expert he may be, who is always able to guage the dosage of the serum and virus so as to prevent occasional disastrous results, if he honestly tries to give the breeder what he is paying for, namely a "life immunity" to his show hogs. To do that the virus used must be an "active" virus, and not an inactive killed virus. It must produce a reaction strong enough to induce an "active" immunity, similar to that acquired by a hog that recovery from a natural attack of the disease—otherwise the immunity runs out. To gain that solid life immunity the hog must suffer some degree of illness, and in the case of show hogs in high condition, it is too great a risk to inject them with an active virus. It is not a safe way to compete for "blue ribbons."

A Warning to Prospective Swine Exhibitors

There is a safer and better way to protect your hogs. You need not lose your show hogs, nor your home herd, and you can save the larger part of that big serum and vaccination bill besides. All that is needed is to use a little sense and sanitation and serum-alone on the show hogs, and keep "virus" off your farms. Our State Veterinarian will confirm the statement that during the past four years not a single outbreak of hog cholera has been caused in the home herds of any exhibitor at the Missouri State Fair. And that but few animals developed suspicious symptoms during the progress of the Fair. The prompt isolation of these and proper disinfection of the pens and hogs, and the use of serum alone prevented the spread of the disease.

No compulsory vaccination of any kind has been required of the exhibitors. But it has been the custom of the Veterinary Department of the College of Agriculture to vaccinate with "serum-alone" the show hogs of any exhibitor who desires it. This service is free of charge. At the close of the fair a considerable number of the exhibitors have their hogs vaccinated with "serum alone" before taking them home.

To prevent the home herd from becoming infected it is the practice of every experienced breeder to isolate or quarantine his show herd for a few weeks on the return from the fairs, and during this period of quarantine proper disinfection measures can be applied to the hogs and their excretions, and the isolation sheds, so as to destroy any possible infection the hogs may carry. This is not a burdensome task to the experienced exhibitor who has formed the habit, and he much prefers this plan to the plans proposed by the serum-virus boosters. It is cheaper and safer and the results are more satisfying.

I would therefore say to the young breeders and exhibitors: do not permit anyone to use that little "virus syringe" on your show hogs, nor on the home herd. Do not permit anyone to bring onto your clean farm a little bottle bearing the label "VIRUS"—"DANGER!" For that little bottle does contain elements of danger which you do not want scattered over your farms. The inoculation of the contents of that virus bottle into your hogs is liable to make some of them sick, and some of them are liable to die, and the urine and dung from the sick hogs contain cholera germs, which it is not well to have scattered over the premises. The scattering of this infection is planting seeds of disease for future trouble.

The fact that the "serum and virus" are imported from Indiana, and may come from laboratories advertised as immaculately clean, and boosted by plausible well written booklets, does not rob "active" potent **virus** of its virulency, and potency for evil when injected into a pure bred sow or boar that is ready to compete for blue ribbons.

In regard to the dangers that come from the unwise exploitation of the "simultaneous method" by commercial serum companies that are more interested in financial dividends than in hog cholera eradication, I will quote from an article written by a level headed veterinarian in Indiana who carries a considerable part of the burdens of the hog cholera control work of that state. Dr. A. F. Nelson, the State Veterinarian of Indiana, says in the June 1 number of the Swine World: **"I rode 91 miles one day last summer and that day did not visit any but sick herds, all of them having been vaccinated by the "simultaneous method", being healthy when vaccinated, the loss ranging all the way from 12 to 94 per cent."**

That Indiana "virus" was evidently deadly stuff, and the serum was not sufficiently potent, or the dose large enough to prevent it from killing lots of hogs in herds that were healthy before vaccination, and which would probably have remained healthy by the use of proper sanitary methods, and a small amount of serum (without virus). But the owners wanted the "life immunity" they had heard so much about. They evidently had read that the losses averaged not more than 1 or 2 per cent. (And taking the average of a thousand or more herds these figures are probably approximately accurate), but these "averages" are not very comforting to the man who loses 12 per cent, and to the man who loses 94 per cent, such data is maddening. As nothing to the contrary was mentioned it is to be presumed that the vaccination was done by graduate veterinarians, and that the serum and virus was supplied by state and federal licensed serum plants—and these may all have done their work carefully, and deserve no blame for the results. But virus is virus; it is disease producing stuff, and it has the habit of giving surprises that are very surprising. And for that reason should be let alone by every breeder who has a show herd ready for the fairs.

I do not know how many of those Indiana herds were pure bred swine, nor how many were being prepared for the county and state fairs, but it is plain enough that none of the herds mentioned were in fit condition to put in the show-ring to compete for "Blue Ribbons." And all this happened in the state where the Serum-Virus Company is located that is advertising such bad advice to the swine breeders and where it is to be presumed the greater part of that company's business is done. But I am sure that the bad advice given by the Serum-Virus Company mentioned does not meet with the approval of the State Veterinarian of Indiana, for this is what he says: **"The more I see of vaccination and its results in a general way, the more I am convinced that sanitation and not simultaneous vaccination is the solution of the hog cholera problem."**

I mention this to show the strong turn of the tide among veterinarians who have no personal financial affiliations with serum companies, against the large and indiscriminate use of virus that has resulted from the commercial exploitation of vaccination.

But we do not have to go to Indiana for examples of bad results from the use of virus in herds of pure-bred swine. I know of breeders in this state who have had to call off an advertised sale because the herd was sick and a considerable number had died, and nothing was in sale condition. And others who have had to withhold from the sale a considerable number of sows that had been advertised as bred sows, but failed on account of the serum-virus treatment and others who have had bred sows

International Harvester Wagons—Weber—Columbus

THERE are a few points about the new **Columbus** and **Weber** wagons that every farmer ought to know. These points make the difference between **Columbus** and **Weber** wagons and others—a difference that means a good deal to you.

The fifth wheel, that prevents the pulling up and pitching of the bolster, makes it easier for your team to pull a **Columbus** or **Weber** wagon and does away with bent and broken king pins and circle irons. The patent folding endgate and the link end rods save much of your time in the busy season. The high-grade wood, iron, steel and paint used add years to the life of **Columbus** and **Weber** wagons. These things mean economy.

These points are explained in detail in our wagon folders and are pictured so plainly that it's almost like looking at the wagon itself. Some dealer near you handles these wagons and has samples set up for you to see. Drop us a line and we'll send you the booklets and folders. We'll also tell you where you can see a **Columbus** or **Weber** wagon so you won't have to waste any time looking for it. Write to us today.

International Harvester Company of America

returned because they were not with pig.

The young breeder who is in haste to get along and have a chance at the "Blue Ribbons" may find himself in the same predicament as the breeders mentioned above if he is misled by the unwise advice given in so much of the serum-virus literature that goes through the mails and even finds its way into some high class agricultural journals, which I am confident have the best interests of the swine industry at heart, but whose advertising managers have not made sufficient study of the serum-virus matter to know what advertising is harmful or what beneficial. It is the duty, however of the editorial staff of every paper to warn its readers against any harmful practice its own columns may have inadvertently advertised.

The time is coming when there will be such a strong line-up of the agricultural press against the commercial use of hog cholera virus, that the interstate traffic in hog cholera virus will be prohibited. It has been charged with carrying "foot-and-mouth disease. Let me beseech you then, young breeder, if you have a clean farm to not let it become a focus of cholera infection by the use of hog cholera "virus," whether it is imported from some other state, or is the domestic variety. Use every possible effort to keep the farm free from disease. Organize an anti-hog-cholera club in the neighborhood for co-operation in keeping the disease out of the district. This will further protect you.

And when you get ready to ship your hogs to the fair, you can make the shipment with safety by keeping in mind the one word "Clean"—clean crates, clean cars, clean pens at the fair, clean troughs, clean buckets, clean bedding. And the time you spend on these details will pay, and you will not regard them as "extraordinary sanitary precautions." Although they may be called so by Dr. Roberts, the president of the Indiana Veterinary College, who is paid to write advertising articles for the Indiana Serum-Virus Company referred to.

Scrub the shipping crates with some good disinfectant. Hot water or fresh slacked quick-lime, or chloride of lime, will cleanse and sweeten the woodwork and kill disease germs. If the crates are old and the floors badly soiled with dung, wet the floor and sprinkle thickly with fresh lime and let stand for an hour then scrub off the floor clean. A three per cent Cresol Compound Solution (Liquor Cresolis Compositis—a pint to each four gallons of water) makes a good chemical disinfectant for spraying and scrubbing the shipping crates. Exposure to the sun for a few hours to dry out the moisture will be helpful.

See that the car in which the hogs are shipped is properly cleaned and disinfected. Saturate the floor and walls with the Cresol Compound Solution, or cover the moistened floor with fresh slacked lime, or lumps of quick-lime, and scrub out clean.

Don't overlook the transfer wagon at the fair grounds. Scrub the floor and sides of the wagon box with the disinfectant mentioned before loading the hog crates. The superintendent of the Swine Department should see that facilities for doing this are provided.

All the pens and alleys in the hog pavilion are thoroughly cleaned and disinfected under the supervision of the State Veterinarian before the opening of the Fair and before any hogs are admitted. Each herd is inspected on arrival, and no sick hogs are admitted to the grounds. A daily inspection is made by the veterinarian of all the hogs. And if an animal shows any symptoms of illness, it is removed to an isolation stall for observation and treatment. The dung and litter from each pen is disinfected and disposed of in a careful manner so as not to expose neighboring pens.

LYON'S PRACTICAL FARM PAPERS

I wonder if farmers generally do as most of us do down here, in regard to work that is usually considered to belong to men who have learned a trade?

We have one barn 36 x 48 feet, and seven years ago put up a 10 x 24 foot shed on the east side, which was all we could afford at the time, so last week we—that is the two boys and I—went to work and put up the other shed 10 x 24 feet, doing the work ourselves in two days. The roof on this shed is of what is usually known as rubber roofing, but we are roofing the main part with so-called cedar shingles, paying $1.75 per square for the rubber and $3.60 per thousand for the shingles, of which 840 lay a square (100 square feet).

We took off white pine shingles laid in 1879, and parts of the roof are good yet, but I do not hope that the cedar will last nearly so long, although another barn, 48 x 60 feet, roofed with them in 1905 is still in perfect condition as to roof.

We will save anywhere from $25 to $30 in carpenters' wages on the shed and roof, and a man who used to be a carpenter told us today that he considered the job as good as any one could do.

Just at this time lumber is cheaper than in years, but you cannot buy it any cheaper in the lumber yards, as the retail dealers are organized—like the farmers ought to be. Would it not be a nice thing to be able to go to the yards and say to the proprietor, "Tommy, I want 22,000 shingles. I am going to pay cash for them, and our association finds that you can sell them at 15 per cent profit for $3.20 per thousand. If you do not choose to sell at that price our agent will put a carload in here and sell at $3.20 with 15 per cent off, or $2.72," and the coon would come down.

I was once among the pine woods of the South for two months, and there saw No. 1 yellow pine mill-run lumber, selling at $9 per thousand feet, and at the yard in our town it was selling at $24, while the cost of bringing it from Forest, Mississippi, to Georgetown, O., was less than $6 per thousand. It is just the same with coal, which we buy by the bushel of 80 pounds, and pay 13 to 15 cents per bushel. Under organization this coal can be set on track in our town at 9 to 11 cents per bushel.

Last harvest we paid 12½ cents per pound for twine, and the grange in an adjoining county bought at 9 cents.

I have often written and oftener said, that the world at large, outside of the farming profession fears more than anything else, a close organization of farmers, and the longer I live the stronger I become in that belief.

With such an organization, and 75 per cent of all farmers members of it, oppressive trusts would have to shut up shop at once, pork barrel legislation would cease, rural credit banks would be established within 100 days, pure food laws would be enforced and adulteration of food products be a thing of the past.

Good Plowing

Cover Trash the Way it Should be Done

The James Oliver No. 11 sulky penetrates hard ground better than any other sulky plow. We stand ready to prove this.

It is the only three wheel sulky that plows as deep on corners as any other part of the field.

It plows a uniform depth in uneven ground.

It is light draft because the rear wheel carries all landside pressure.

The new Oliver trash coverer covers all kind of rank weed growth successfully.

Ask Oliver dealers or write us for full particulars.

Plowmakers for the World

ST. LOUIS KANSAS CITY

No matter how good a friend to the farmer the doctor, the lawyer, the banker, the artisan, the merchant, and all other professional men may be, they do not want to see the farmers of the entire country in a close organization, for they all think, right or wrong, that such an organization would give the farmer too great an advantage. Their opposition it is, that prevents thousands of farmers from joining any organization.

Georgetown, O. C. D. Lyon.

WE DEMAND BETTER ROADS NOW

Editor The Missouri Farmer:

After a term of dry years, during which our roads often suffered because rain did not come often enough, we have a season that has tested them to the limit.

Speaking for Northwest Missouri: This is the wettest season in our history. I am in my twentieth year of road dragging and I cannot remember a season when it was even one-half as difficult to keep any road in decent condition as it has been this one. No doubt our standards are higher—we demand better roads than we thought were good 20 years ago. Also we have more travel.

All these years of dragging I have been criticised by certain hasty, short-sighted people because I keep my half mile of road dragged to a high oval. Within the month an old neighbor took me to task on this account. During these dry years I have had a strenuous time holding my own with abstract argument, but this season, with flat-dragged, seepy spots cutting through and going to the bad all around me, while my old famous reformed mud-hole, about a quarter south of the house, has arched its thick steep-backed shell and resisted both rain and wagon wheels without a single day of failure—I have had a concrete example that gives support for my line of reasoning; and sentiment is growing rapidly in favor of my high-dragged highway as a system.

The argument is this: One had better be patient with a slippery road for a few hours, if one happens to be caught out in a heavy rain, rather than be forced to accept the alternative, which is a series of periodically impassable mudholes.

Another of my contentions that has more adherents than in former years is for the wisdom of lifting the road center gradually by dragging rather than by quickly heaping the middle full of loose earth and calling it an improved highway.

Our frequent torrential rains have emphasized this point during the past spring and summer. A heavy rain would gully a freshly graded road. An alert road boss would gather men and teams, get out the big grader and fill it in. Again a heavy rain—that same night, or maybe with a day between—and out would go the earth once more.

Well dragged roads were little affected by the rains except that they required more frequent dragging and the spring holes, or seeps, needed more care in dragging.

We need now to insist on properly built drags—so that the best of dragging can be done—and then we must have the better dragging.

Maitland, Mo. D. Ward King.

If you have a late immature field of corn that happens to be caught by an early frost the best thing to do with it is to cut at once and put it into the silo. It will be worth more as silage than any other way.

Farm Manager Wanted

Wanted, man to run sheep and dairy ranch. Must be responsible and have $2500 to buy half interest in live stock and farm implements. Will give the right man half the yearly profits; 1100 acres grazing land, part of which can be cultivated—all well fenced. Fine opportunity for right party.

Mrs. Anna Mitchell,
9-152t Monroe City, Mo.

THE MISSOURI FARMER

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

Vol. VII September 15, 1915 No. 18

William Hirth - - - Publisher
Geo. B. Ellis - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year in Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct, always inclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

THE LAND BANK BILL

We want our readers to keep in mind the importance of getting every voter to understand the importance of the Land Bank Bill to be voted on at our next general election. The committee appointed to draft the amendment and the petitions will probably finish its work within the next few weeks and then the canvas for signatures and the campaign for the Bill will begin in earnest. As soon as the petitions are ready we will supply those who have volunteered to circulate them with copies and to others who feel like they want to help the cause along.

In this connection let us suggest that it is taking quite a lot of money for postage and if any one feels like contributing to a good cause they should send their contribution to Dr. E. H. Bullock, Edina, Mo., who will see that proper credit is given and that the money is properly used.

COUNTING THE COST

The Year Book of the U. S. Department of Agriculture for 1914, recently issued, estimates the loss for swine raisers for the year 1913 at $66,439,470. Missouri's part of this loss is placed at $6,079,412. It is estimated that 90 per cent of the total losses from all swine diseases is from hog cholera which would make the loss from that one cause in this state $5,471,470. This is nearly fifty thousand dollars average to the county and in fact the loss in some of the best hog raising counties is several times that amount.

The most serious aspect about this situation is that hog cholera is on the increase and unless something is done to try to eradicate it the business of making pork will become expensive and hazardous. Only two years previous to the date of the above statistics the Department of Agriculture estimate the annual loss from hog cholera at only $18,000,000. If we turn to the big packing plants where the statistics are more reliable and positive we find that the number of hogs condemned on account of cholera has increased from 7,677 in the year 1910 to 116,107 in the year 1914. There was a marked increase in the number of cholera-infested hogs received in every one of these five years over the preceding year while the total number of hogs received at these plants showed a very small increase. While the cholera cases increased by fifteen times the number in 1910 the number of hogs increased by only one-sixth.

If hog cholera is ever eradicated or even reasonably well controlled in this country it must be done along the lines experience has shown that have been successful in controlling other infectious diseases and that is by isolation and sanitation. We are discussing this matter now from the standpoint of eradication in the whole country.

The individual farmer may find it practicable to control cholera on his own farm by going to the expense of immunizing his whole herd and keeping up the practice regularly year after year but unless every other man in the township or county does the same thing you will have permanent infestation in place of eradication.

But suppose we admit for sake of argument that hog cholera can be controlled by the simultaneous process of immunization provided it is made compulsory by law and every hog raiser is required to immunize his hogs, then what will be the cost? We produce annually in Missouri around 5,000,000 hogs. The cost for serum and virus will average fifty cents a head at the lowest estimate and the veterinary fee for administering the stuff ten cents a head additional. The annual tax then on the hog raisers of the state for serum, virus and veterinary bills would be $3,000,000. But this is not the whole cost. In the use of virus the hogs must be fed lightly for two or three weeks and the hogs will be more or less off condition and will make no gains during this time. For this loss if we count but a pound a day for fifteen days and pork is worth seven cents a pound we have more than a dollar a head or $5,000,000 to charge up to the swine raisers. But this is not all! Under the best conditions and with the most careful handling there will be some death loss from the use of serum-virus. The loss may vary from nothing to half or more but a very low and conservative estimate of farmers and veterinarians we have talked with would be 3 per cent of all hogs treated, which for the whole state if compulsory immunization were required, would mean a loss of 150.000 hogs or a dollar loss of at least $1,500,000.

Summing up then the cost of immunization for the whole state we have, for one year only, this showing:

Serum, virus, veterinary	**$3.000.000**
Loss of condition and weight	**5.000.000**
Loss by death	**1,500,000**
Total cost of immunization	**$9,500,000**

The serum manufacturers and veterinary profession are getting a good thing out of the situation, but if the cost would end there the business of hog raising might bear it but the other and greater losses are eating into the very vitals of the business, and it is time farmers were looking at the proposition from the general and future welfare of the swine raising industry.

JACK FROST AND THE CORN CROP

According to the September crop report of the Department of Agriculture the corn crop of the whole country promises a total yield of around three billion bushels. If this forecast makes good we will have about 300,000,000 bushels more corn than we had last year. For Missouri the estimate is for 207,900,000 bushels against a crop of 158,400,000 bushels last year. The estimate for the whole crop is about ten per cent above the five-year average and the Missouri crop is about three and one-half per cent above the same average. There is one fault we find in the estimates of both the state and the Government reports and that is they have made their estimates on the whole acreage planted whereas all through the best part of the Corn Belt there are thousands of acres of corn entirely abandoned because of overflow or wet weather. But the corn is not yet safe from a killing frost and it will take some time yet for it all to be out of the way of a freeze.

FUTURE OUTLOOK FOR WHEAT

A reader writes the following letter which is similar to many others received within the last few weeks:

> I would like your views, as far as you feel at liberty to express them, in reference to the advisability of holding wheat for higher prices than are now prevailing. The sentiment has been strong in our section for better prices later on, while some contend that the lack of an export market, will bring the price of wheat down even below the present prices. Being interested in three large farms containing about 2000 acres we naturally want to get as much for our wheat crop as possible.

We shall not attempt to answer these inquiries for it is against our policy to advise our readers as to future prices on any crop for the wisest men make some mistakes. But we will discuss with our readers the present wheat situation and with these facts and all others they can get they must decide for themselves.

In the first place contrary to all expectations nearly all the countries of Europe have produced more wheat than last year. One uncertainty that we do not know where to place is the surplus of Russia. There is enough surplus there to make an impression on the market if it can be brought out but so long as it is bottled up it need not be counted a bear factor.

The Government September report estimates our total crop this year at 659,000,000 bushels winter wheat and 322,000,000 bushels spring wheat—a total crop of 981,000,000 bushels as compared with 891,000,000 bushels last year. But the Government has not yet made allowance for abandoned acreage and for wheat damaged and not fit for milling and when that is allowed for we will probably have a smaller crop by two or three per cent than we had last year. Canada has a very large crop this year estimated at 170,000,000 to 200,000,000 bushels above what they will need at home and owing to conditions brought about by the war it is probable that the Canadian surplus will be taken before much of our surplus is bought. It is reasonable to suppose that the excessive rains we have been having, the great fall in the price of wheat since harvest and the prevalence of Hessian fly will probably be factors strong enough to reduce the acreage sown this fall. With these facts before us it looks to us that the chances are about even for wheat to hold its own for the next few months with a little better chance for improvement later in the season. The man who has his wheat thrashed and in the bin in good condition and has it insured against loss by fire is not carrying a heavy risk as we see it and neither has he any very great chance for speculative profits. But some one must hold the wheat and the farmer who has good dry granaries ought to be able to hold it as cheaply as any one else.

Just a word of caution: If you have wheat in the granary this year do not fail to examine it for grain weevil and if you find the wheat infested you had better fumigate your bins as explained on page 9 of this issue.

EFFICIENCY IN PUBLIC OFFICE

If the public should demand the same efficiency of men in public positions as farmers expect and usually require of their hired men we would have a lot more money to improve our public shools and country roads. But the average man seems to think that a public salaried position is license for an easy time. It will always be so until the public mind becomes aroused and sufficiently interested to demand the same conscientious devotion to public work that is required of private employment. There are few state offices or departments but what could save a good percentage of their expenditures if they were put on a strictly efficiency basis.

A few years ago in a county where the writer lived an illiterate man was elected to the office of county recorder. He drew a salary (paid in fees) of $5,000 a year but he did not and could not transcribe a single legal document. A very efficient clerk or deputy working on a salary of $1000 a year did the work. This condition and other similar instances may be found in many counties and equally deplorable conditions exist in some of our state institutions and departments.

It looks like about the first thing some men do when they are elected or appointed to public office is to raise a howl about how hard the work is and how great the responsibility and how small the salary! We think the first and greater cause for this is blind allegiance to party. The average man is too quick to condemn everything he sees in one not of his own political faith and always ready, for supposed political expediency, to excuse and cover up or try to minify the shortcomings of one of his own party. There is no good reason for letting differences of opinion on National questions divide us on questions affecting the management of county affairs through the county court, the highway engineer, the county clerk and similar positions. So long as county elections are held at the same time as State and National elections most men will continue to vote their party ticket straight. That being true every man should make it his business to inform himself well about every prospective candidate for a county or state office and use his influence and his vote to have the best men nominated for office. If all men would do this it would make little difference which party succeeded.

We are not opposed to political organization but we think we should use such organization for greater efficiency in office rather than to destroy it.

We call attention to this matter just at this time for the reason that political slates for next year's elections are now in the making. The bosses are meeting with official aspirants and deals are on to eliminate certain men and to boost others and now is the very time for the farmer and the merchant, the laboring man and others whose sole aim should be to get honest, efficient men in office to make their influence felt. The election of a thoroughly efficient business man for Governor of this State, who would ignore for once the political bosses and who would fill all our state boards, departments and institutions with thoroughly efficient men and men who were enthusiastically and patriotically for the best interests of the state—if this could be done, it would give Missouri quite a different kind of publicity than what we are now receiving concerning the disputed school fund and anticipated shortage in state revenues.

BUCKSHOT BY "THE PROFESSOR"

I'll bet every time Woodrow Wilson hears a fire-cracker go off he jumps and thinks it's a submarine.

I heard a fellow argue against alfalfa the other day because he said, "It keeps you busy cuttin' the durn stuff all summer long."

"Bill" Taft has got more nerve than anybody I ever heard of. He's got those fellows across the pond skinned a city block. He's come out "agin" Woman's Suffrage.

I guess "Teddy" must have blown his cylinder heads out when he made that speech to the soldier outfit at Plattsburg, New York, recently. He's been quiet for three whole weeks.

Pick out a bright farmer boy in your neighborhood and tell him The Missouri Farmer will pay his way through the "Farmers' Short Course" at the Agricultural College this winter if he will give us the benefit of his spare time during the next two months.

Do you hear a strangling, gurgling subdued kind of noise? Well, don't get excited. It's the Standard Oil Co. trying to put the castor bean out of business by marketing a substitute for castor oil. It will all be over in a little while—and the castor bean will look as if a steam roller had run over it.

Before I throw my hat up in the air and tramp on it over this "big army" and "big navy" proposition I want to know who it is we are going to have to fight. I'd hate to get all "het up" and then find out that there isn't anybody left to scrap with. First, "show me the enemy" and then I'll promise to throw the finest, assorted bunch of fits anybody ever saw.

They jerked up old "Deacon" Jones the other day and tried him for swearing. One of his gossipy old neighbor sisters said she had heard him cuss the "consarn d—— salt" all summer long. When the other deacons confronted old Jones he smiled angel-like and said: "What I said gentlemen was, "Consarn the damp salt"—and they finally voted to let him off. All I've got to say is that the "Deacon" is one of the smoothest old scamps I ever knew.

They held a voting contest for the "homeliest looking man" at a big picnic in central Missouri the other day and an awful plain looking man won it. A little bit later "Sam" Jordan, the famous Pettis County Farm Agent, who is known from the Atlantic to the Pacific, arrived on the scene to make a speech. When the "awful plain looking man" got a good squint at Sam he arose solemn-like and said: "I make a motion that there vote which was took a little while ago he reconsidered"—and it carried with a whoop.

TO KILL GRAIN WEEVIL

A reader from Washington County writes that his wheat is infested with weevil and would like to know how to be rid of the pest.

The remedy usually recommended by our experiment stations and the United States Department of Agriculture is to fumigate with bi-sulphid of carbon. This can be bought at drug stores for 30 to 40 cents a pound in small amounts and for very much less in fifty-pound packages. If there are any weevil in the bins it is a good plan to fumigate the bins before the grain is put in and if the weevil appears fumigate again after the grain is in the bin.

In the first place the bin must be made as nearly air-tight as possible. This may be done by tacking building paper over all cracks, knot-holes and other open places. The amount of bi-sulphid to use will depend somewhat upon how nearly air-tight the bin is. The Michigan station recommends the use of one dram for every cubic foot of space in the bin. Count the whole space in the bin whether it is full of grain or not. At this rate a wheat bin 6 x 10 feet by 6 feet high would take about 2 pounds of bi-sulphid.

The Kentucky station reports that with 3.2 ounces per 100 cubic feet only 10 per cent of the weevil were killed in five hours, but the same amount killed all the weevil after 10 to 24 hours. Where there is only a small amount of grain and no tight bin is available large boxes will answer and for a 10-bushel box about four ounces of the bi-sulphid will be sufficient.

After the bin is made air-tight put some shallow dishes or crocks on top of the grain pour the bi-sulphid in the dishes and quickly close the bin.

The Michigan station says that "If the seed or grain is more than two or three feet deep in the bin, the liquid should be poured into it at some depth in order to insure its spreading evenly and filling all the space treated. This is easily done with a piece of gas-pipe fitted with a wooden stick for its entire length. The pipe with the stick inside it is thrust down half way to the bottom of the bin, then the stick withdrawn and the liquid poured down through the pipe. The stick merely prevents the pipe from becoming filled when thrust into place."

The liquid when poured into the dishes or into the pipe will soon be transformed into gas and as it is heavier than air it settles to the bottom and fills all spaces in the grain.

No fire or light should be near when using the liquid or when opening up the bin as it is a very explosive gas. Care must be taken not to breathe the fumes much as they are very poisonous. The bin should remain closed for twenty-four to forty-eight hours and then opened up to let air out.

This method is good for seed corn, beans, wheat and in fact all grains liable to infestations by any of the grain weevils.

BLACKLEG IN CALVES

A reader from Henry County writes he has lost a calf recently from what he fears is black leg and wants to know what to do to protect the rest of his herd.

Blackleg is a very fatal disease, especially among young cattle. It is more liable to occur in calves and yearlings. When an animal dies of blackleg it should be burned where it dies if possible. If allowed to lie on the ground to decay or if cut open for examination the germs are spread. If it is not safe to burn them the carcass should be buried deeply and cover the place where the animal has been with quick lime.

For prevention all young animals up to two and a half years old should be vaccinated. The U. S. Department of Agriculture recommends revaccination every six months. The vaccine is made by several firms and it can also be had free of charge from the Bureau of Animal Industry, Washington. D. C.

"The disease manifests itself by swelling under the skin of the fleshy parts of the body, usually the quarters, hence the name "quarter ill." The animal becomes lame and lags behind the herd. In experimentally inoculated animals, they frequently continue to eat as long as they can stand. The swellings, at first hard, hot, and painful, later become cold and insensitive, while the skin becomes discolored and leathery. Gas accumulates underneath the skin so that when pressed with the fingers a crackling sound is heard similar to that produced by placing a piece of paper under the coat and rubbing with the hand. The animal finally goes down, and lies struggling upon the ground, catching its breath in gasps. and expelling it with groaning, grunting sounds. The head is frequently thrown to the side.

"After death the animal is found in distorted positions, and is usually bloated as tightly as the skin will hold. which causes the legs to stick straight out horizontally in a characteristic attitude. Bloody fluid oozes from the natural openings, is forced in drops from the skin, and collects in large blisters under the outer layers.

"On cutting into the swollen parts a sweetish, foul smelling gas rushes out, and a bloody, frothy fluid runs from the opening, sometimes accompanied by the black, mushy, disintegrated muscle, which is forcibly blown out by the pressure of gas. The loose tissue underneath the skin is filled with a bloody fluid and bubbles of gas, which appear as a quaking gelatine-like mass. The divisions between the muscles contain the same fluid and have a greenish metallic color while the muscles are soft and black.

"This condition is not general throughout the body but is confined to certain affected portions. The organs seldom show extensive changes."

WELCOME MISSOURI FARMERS

Do you live on a farm? Then you have farm problems. Maybe it's alfalfa or soybeans, fertilizers, or cover crops, pruning or packing, animal rations or animal diseases, housekeeping or house building. Whatever your problem is, bring it to the Missouri State Fair and talk it over with the men and women from the College of Agriculture who will have their headquarters in the University building just inside the railroad entrance to the fair grounds.

Twelve men and women from the college will make up the "first aid" squad who will be on the job all week to take care of farm and farm home troubles brought to them for emergency treatment.

The opportunity to "talk things over" is only a small part of the service which the College of Agriculture will give to Missouri farm folks. One half of the University building—a space 30 x 120 feet—will be filled with exhibits telling the story of successful farm practice in Missouri in a way that even he "who runs may read." And like the three-foot colored boy with the six-foot stomach whose faith was expressed in the contention, "Not too much watah-million but too little niggah," the College of Agriculture finds it necessary this year, after taxing the capacity of the University building, to occupy a tent with 850 feet of floor space and an additional 2,500 feet in an adjacent building.

Lectures and demonstrations along the lines of soils, fertilizers, farm crops, corn judging, live stock judging, feeding of live stock, cooking, canning, and baking will be conducted. In the tent there is to be a hog cholera demonstration showing right and wrong conditions for the spread of the disease. Just outside the tent is where the big cholera clean-up demonstration will be given Thursday, September 30.

The "big show" will be in the University building. There you will find a whole carload of talking points—something of interest to every member of the family. Like the farm sale they are "too numerous to mention." But why mention them anyway, for all Missourians will want to see this all-Missouri feature of the big all-Missouri fair, Sedalia, September 25 to October 1—every day a Fair Day.

A. J. Meyer,
Extension Service, University of Missouri.

Clover Silage

The Missouri Farmer:

Can you give me any information in regard to filling a silo with clover? What quality of silage will clover make? W. R., Higginsville, Mo.

With any legume crop such as clover, alfalfa, soybeans, cowpeas, etc., where the weather will permit it is better to make hay of the crop and fill the silo with corn, kafir or sorghum. But when it is raining every day, and the clover or other legume is likely to spoil if cut for hay it can be put into the silo and will make fairly good silage but the keeping qualities are not so good as corn. If put into the silo it will probably be best to feed it out early, say during the early part of the winter and then if desired the silo may be refilled with shock corn. If you have corn ready for silage you will get better results by mixing the clover with corn, load about and this mixture will keep and make good silage. The acid in the corn will help to keep the clover. The clover should be well matured before it is cut for silage.

SOME NEW BOOKS

"Common Diseases of Farm Animals." The greatest loss farmers annually sustain is caused by diseases among live stock and most of this loss could be prevented by adopting better sanitary measures and better care in feeding. A book just received "Common Diseases of Farm Animals" by Dr. R. A. Craig, Purdue University should prove valuable to both the student and the stockman. The author lays special stress on the cause and prevention of disease and that is what the average stock raised should know something about. The book is nicely illustrated and printed and published by J. B. Lippincott Company.

"Productive Swine Husbandry," a recent book by J. B. Lippincott Company is by George E. Day of Ontario Agricultural College, who is favorably known in the United States, will prove valuable to any swine raiser or agricultural student. The prominent features of the book are: Breeds of Swine with the history and description of each breed and good photographic illustrations; Results of Experiments in Swine Feeding; Feeding and Management; Marketing and Curing; Buildings, Sanitation and Diseases. The book ought to prove a valuable and reference for any swine raiser.

If you have no silo about the best thing you can do with your late corn is to cut for fodder and feed out early.

A HOUSE? A BARN? A GRANARY?
A SILO? WHAT ARE YOU GOING TO BUILD?

Whatever it is to be—*This Is Your Best Time To Build!*

And whatever building you have been considering, build it now. You'll save money by it.

Since the European war has curtailed lumber shipments from this country, there never was a time when such large and complete stocks of high grade Southern Yellow Pine were available everywhere in the markets here. And prices are exceptionally reasonable—you'll be surprised to learn how little it will cost you to provide for your building needs.

SEE YOUR LUMBER DEALER NOW!

Ask for prices on *Southern Yellow Pine*, the best wood that grows for all 'round farm building and repairs.

Note This: If you want up-to-date plans for economical and convenient farm homes, barns and other buildings, complete with lumber bills, we have them—and they're yours FREE for the asking. Also, we have a free book, "How To Choose and How To Use a Silo," the most practical work of the kind ever published. Send for it.

P. S.—We have nothing to sell to you.

The Plunderer

By ROY NORTON

Author of "The Garden of Fate"

(Continued from last issue)

"Is the boss here?" Bill asked, pausing in front of the man with a wave.

"Who do you mean—Lily?" was the familiar reply.

"Yes."

"I think she's over helpin' nurse the Widder Flannery's sick kids this afternoon. They've got chicken pox. Might go over there and see her. if you're in a rush."

"We didn't say we wanted to borrow money," Bill retorted to the jocular latter part of the bartender's speech. "What time will she be here?"

"About ten, I guess," was the more courteous reply.

The partners walked out and past the row of buildings until they came to a general store, where they occupied themselves in making out an order for supplies and arranging for their delivery on the following day. The trader was a loquacious individual with the unmistakable "Yankee" twang and nasal whine of the man from that important speck of the United States called New England.

When they again turned into the street, the long twilight had been replaced by night, and on the tops of the high peaks to the westward the light of the full moon was beginning to paint the chill white with a shining glow. The street was filled with men, most of them scorning the narrow board walks and traversing the roadway. A pandemonium of sound was robbing the night of peace through music, of assorted character, which boiled forth from open doors in discordant business rivalry, but underneath it all was the steady, dull monotone of the stamp-mill, remorselessly beating the ore as if in eternal industry.

"Hardly know the place now, eh?" Bill said, as they entered the open doors of the High Light. It certainly keeps gettin' more homelike. Camp must be makin' money, eh?"

Dick did not answer. He was staring at a woman who stood at the lower end of the bar outside, and talking to a man with a medicine case in his hand. He surmised that she must be The Lily, and was astonished. He had expected the customary brazen appearance of other camp women he had known in his years of wandering; the hard-faced, combatative type produced by greed. Instead, he saw a woman of perhaps thirty years of age, or in that vague boundary between thirty and thirty-five.

She was dressed in a short skirt, wore a spotless shirt waist over an exceptionally graceful pair of shoulders, and her hair, neatly coiled in heavy bronze folds, was surmounted by a white hat of the frontier type, dented in regulation form with four hollows.

From the hat to the high tan boots, she was neat and womanly; yet it was not this that attracted him so much as her profile. From the straight brow, over the high, fine nose and the firm lips to the firmer chin, the face was perfect.

As if sensing his inspection, she turned toward him, and met his wondering eyes. Her appraisement was calm, repressed, and cold. Her face gave him the impression that she had forgotten how to smile. Townsend advanced toward her, certain that she must be the proprietress of the High Light.

"You are Miss Meredith?" he interrogated, as he halted in front of her.

"Mrs. Meredith," she corrected, still unbending, and looking at him questioningly as to his business.

A forgotten courtesy impelled him to remove his hat as he introduced himself, but Mathews did not follow it when he was introduced, and reached out and caught her competent hand with a hard grip. Dick explained his errand, feeling, all the time under that steady look, that he was being measured.

"Oh, yes, they'll be all right by tomorrow, Lily," the doctor interrupted. "Excuse me for being so abrupt, but I must go now. Goodnight."

"Goodnight," she answered, and then: "I'll be up there at three o'clock tomorrow afternoon. Ah, you were saying you wanted——"

She had turned to the partners again with her unfinished question leading them on to state their mission.

"Men. Here's a list," Dick answered, handing her a memorandum calling for so many mill-men, so many drill runners, swampers, car handlers, and so forth; in all, a list of twenty odd.

"Who told you to come here?" She exploded the question as if it were vital.

"Park. Bells Park."

She laughed mirthlessly between lips that did not smile and regular, white teeth. But her laugh belied her lack of sympathy.

"Poor old Bells!" she said, with a touch of sadness in her voice. "Poor old fool! I tried to keep him from gambling when he had money, and he went broke, like all the other fools. But he loved his wife. He made her happy. Some one in this world must be happy. So he came back, did he? And is up there at the Cross? Well, he's a faithful man. I'm not an employment agency, but maybe I can help you. I would do it for Bells. I like him. Good men are scarce. The bums and loafers are always easy to get. There isn't a mine around here that isn't looking for good men, since they made that discovery over in the flat. Most of them broke to the placer ground. Wages are nothing when there's a chance for better."

She had not looked at Dick as she talked, but had her eyes fixed on the paper, though not seeming to scan its contents. The room was crowded with men and filled with a confused volume of sound as she spoke, the click and whir of the wheel, the monotonous voice of the student—turned gambler—calling "Single O and the house wins. All down?" the sharp snap of the case-keeper's buttons before the faro lay-outs, the screech of the orchestra in the dance hall, and the heavy shuffling of feet; yet her words and intonations were distinct.

"We would like to get them as soon as we can," Dick answered. "We have unwatered the main shaft and——"

From the dance hall in the rear there came a shrill, high shriek, oaths, shouts, and the orchestra stopped playing. Men jumped to their feet from the faro layouts, and then, mob-like, began to surge toward the door, while in the lead uttering scream on scream, ran one of the dance-hall girls with her gaudy dress bursting into enveloping flame. She had the terror of a panic-striken animal flying into the danger of the open air to die.

As if springing forward from live ground, Mathews leaped into her path, and caught her in his arms. He jammed her forward ahead of him, taking no pains to shield her body save with his bent arm, and seized the cover of the roulette wheel, which lay neatly folded on the end of the bar.

"Give me room!" he bellowed, in his heavy, thunderous voice. "Stop 'em, Dick! For God's sake, stop 'em!"

Dick leaped in among the crowd that was madly stampeding—women with faces whose terror showed through masks of rouge, shrieking, men who cursed, trampled, and elbowed their way to the outer air, and the wild-eyed musicians seeking to escape from a fire-trap. Dick struck right and left, and in the little space created Bill swathed the girl in the cover, smothering the flames. And all the time he shouted:

"Don't run. What's the matter with you? Go back and put the fire out! Don't be idiots!"

As suddenly as it had commenced the panic subsided, and the tide turned the other way. Sobbing women hovered round the door, and men began to form a bucket line. In a long age of five or ten minutes the excitement was over, and the fire extinguished The dance-hall floor was littered with pieces of scorched wood torn bodily from the boxes, and the remnants of the lamp which had exploded and caused the havoc were being swept into the sodden, steaming heap in the center of the room.

Through the press at the sides came The Lily, who, in the turmoil, had sought refuge behind the bar. The partners, stooping over the unconscious, swaddled figure on the floor, looked up at her, and Dick saw that her face was as calm and unemotional as ever.

"Bring her to my room," she said; "I'll show you where it is. You, Tim," she called to one of the bartenders, "go as quickly as you can and get Doctor Mills."

The partners meekly followed her lead, pausing but once, when she turned to hold up an authoritative hand and tell the curious ones who formed a wake that they must go back, or at least not come ahead to make the case more difficult. Mathews carried his senseless burden as easily as if it were of no weight, and even as they turned up a hallway leading to a flight of stairs ascending to The Lily's apartments, the doctor and bartender came running to join them.

Not until they had swathed the girl in cooling bandages did any one speak. Then, as they drew the sheet tenderl over her, they became conscious of one another. As Bill looked through blistered eyelids, exposing cruelly scorched face, his lips broke into a painful smile.

"Doctor," The Lily said, "now you had better care for this patient."

She put her firm, white fingers out, brushed the miner's singed hair back from his brow, and said: "I've forgotten your name, but—I want to say —you're **a man!"**

CHAPTER VI

MY LADY OF THE HORSE

"It serves you right for bein' so anxious to help one of them dance-hall women; not but what I'd probably 'a' done it myself," was the croaking, querulous consolation offered by Bells Park as he sat beside the singed, suffering and heavily bandanged Bill that night, or rather in the early hours of the morning, in the cabin on the Cross. "They ain't no good except for young fools to gallop around with over a floor."

He poured some more olive oil over the bandages, and relented enough to add: "All but The Lily, and she don't dance with none of 'em. She's all right, she is. Mighty peart looker, too. None purtier than Dorothy Presby, though."

Dick looking up from where he sat with his tired chin resting on his tired hands and elbows, thought of the gruff Bully Presby with some interest.

"Oh, so the old Rattler owner has a daughter, eh?"

"I don't mean old skinflint Presby!" sharply corrected the engineer. "He ain't the only Presby in this whole United States, is he? He don't own the whole world and the name, even if he thinks he does. This Presby I'm talkin' about ain't no kin of his. He's too white. He owns all them sawmills on the other side of the Cross peak, about four miles from here. Got a railroad of his own. Worth about a billion, I reckon."

Dick's momentary interest subsided, but he heard the old man babbling on:

"I worked for him once, when Dorothy was a little bit of a kid. Him and me fought, but he's a white man. She's been away to some of those fool colleges for women back East, they say, for the last four or five years. It don't do women no good to know too much. My wife couldn't read or write, and she was the best woman that ever lived, bar none."

He looked around as if delivering a challenge, and, finding that no one was paying any attention to him, subsided, figeted for a minute, and then said he guessed he'd "turn in so's the water wouldn't gain on the pumps in the mornin'."

On the insistent demand of his partner, Dick also retired shortly, and the cabin on the hillside was dark save for the dim light that glowed in the sufferer's room.

They began to straggle in, the men wanted, before the partners had finished their breakfast on the following morning. Some of them were real miners, and others were nondescripts, bearing out The Lily's statement that good men were scarce, but all were hired as they came, and the Croix d'Or began to thrill with activity.

A fat cook—and no miner can explain why a camp cook is always fat —beamed from the messhouse door. A blacksmith, accepting the ready name of "Smuts," oiled the rusted wheels of his blower, and swore patiently and softly at a new helper as he selected the drills for sharpening. Three Burley drill runners tinkered with their machines, and scraped off the verdigris and accumulated dust of storage; millmen began to reset the tables, strip the damaged plates, and lay in new water pipes to drip cease-

"The Quality Goes IN Before the Name Goes ON"

Learn How To Select a Good Piano

Buying a piano is not the mystery some people think. There are many tests described in our *series of free booklets* which anyone can apply and weed out poor pianos from the good ones.

Naturally the makers of inferior pianos prefer to keep you in the dark, but we are glad to give you these tests with the hope that you will try them on the

Crown Piano

If you buy a piano on its merits, you will consider the Crown and a few others. You will appreciate the superior tone and action of the Crown, and recognize unusual value—a thoroughly high grade instrument at a reasonable price.

Insist on seeing and hearing the Crown before you buy. Its selection means immediate and permanent satisfaction. *Send for the booklets NOW.*

lessly over the powdered ore. Over all these watched Bill with his bnadaged face, rumbling orders here and there, and tirelessly active. Out on the pipe line, winding by cut and trestle from the reservoir in the high hills, Dick superintended repairs and laid plans.

Leaving his gang replacing sections near the power-house, he climbed up the length of the line to discover, if possible, how far the labors of the vandal had extended. Foot by foot he had traversed it, almost to the reservoir itself, when he paused to breathe and look off at the mountains spread below and around.

The Cross, in the distance, was softened again to a miracle of dim yellow laid against a field of purple, and, like a speck, a huge eagle swept in circles round its point to come to rest on its extreme summit. He turned from admiring its flight to inspect a bowlder that had tumbled down from the slop above and come to rest in a big dent; it had smashed in the top of the pipe. He picked up a piece of a storm-broken limb, used it as a lever, and sent the rock crashing across the pipe to go bounding down the hillside as it gained momentum with every leap.

There was a startled snort, a sudden threshing of the brush, and it parted to disclose a girl astride a horse that was terrified and endeavoring his best to dismount his rider. Dick, surmising that horse and rider had suffered a narrow escape from the bowlder, ran toward them remorsefully, but the girl already had the animal in control after a display of splendid horsemanship.

"Thank you," she said, as he hastened toward the horse's head, intent on seizing the snaffle. Please don't touch him. I can quiet him down."

"I am so sorry," he pleaded, with his hat in his hand. "I had no idea that any one ever rode up this way."

"Don't apologize," she answered, with a careless laugh. "No one ever does, save me. It's an old and favorite view of mine. I used to ride here to see the Cross, many years ago, before I went away to school. So I came back to see my old friend, and—well—your bowlder would have struck us if my horse hadn't jumped."

She laughed again, and reached a yellow-gauntleted hand down to pat her mount's shoulder with a soothing caress. The horse stopped trembling, and looked at Dick with large, intelligent eyes.

"Ah," said Dick, remembering the garrulity of the engineer. "I believe you must be Miss Presby."

Even as she said simply: "I am, but how did you know? I don't remember ever seeing you," he took note of her modish blue riding-dress with divided skirts and patent-leather boots. There was a clean freshness about her person, a smiling candor in her eyes, and a fine, frank girlishness in her face that attracted him beyond measure. She appeared to be about twenty years of age, and was such a girl as those he had known and danced with, in those distant university days when his future seemed assured, and life a joyous conquest with all the odds in his favor. Now she was of another world, for he was, after all, but a workingman, while she, the daughter of a millionaire lumberman, would dance and associate with those other university men whose financial incomes enabled them to dawdle as they pleased through life. He had no bitterness in this summary, but he sustained an instant's longing for a taste of that old existence, and the camaraderie of such girls as the one who sat before him on her horse.

"No," he said, looking up at her, "you never saw me before. I have been in the Blue Mountains but six weeks. I am Richard Townsend."

Her face took on a look of aroused interest, different from the casual look she had been giving him in the brief minute of their meeting.

"Oh," she said, "then you must be the Mr. Townsend of the Croix d'Or. I learned of your arrival last night after I came home. You are rehabilitating the old mine?"

"Yes," he answered, smiling. "At least we are trying to. As to the outcome—I don't know."

"You mustn't say that!" she protested. "Faith in anything is the first requisite for success. That's what it says in the copybooks, doesn't it?"

(Continued in next issue)

Home Makers' Conference

This Department is Edited by Miss Alice Kinney, New Franklin, Mo.

HOW ORGANIZATION IS DONE IN NEBRASKA

From a Nebraska reader comes the following interesting report:

Dear Home-Maker's Conference:

I am quite interested in your department of The Missouri Farmer, and as we once lived in Missouri I wish to tell you of our National Home Canning Club, which was first called the Nebraska Home Canning Club, but as the interest extended into other states we enlarged our boundary.

Our object is to promote home canning of fruits, vegetables and meats and give mutual help to each other; the only requirement being to report the number of cans put up and the number of chickens they have canned under the steam pressure system and report not later than October 1st, 1915.

The members have in their cellars such a variety of material that a novice would think it was a day in June rather than a possible bleak winter day—it is like having a garden the whole year 'round and ever so much better than living out of the butcher shop.

Every day the members of the National Home Canning Club are giving their friends such delightful surprises that their guest, after learning "how" firmly resolve to join and help fill more cellar shelves with something beyond fruit and jellies. As we enjoy our beautiful store of canned goods our hearts go out in sympathy to those who have failed in their bright anticipations for a full supply of home product, by floods or drought even after the garden was a dream in bright promises.

"With our first failure comes the starting point of success." So in locating the garden if possible hunt a more fertile spot of ground or a higher locality which will be above high water mark, and above all else better cultivation which always brings better results.

The individual reports of this club show that the following things have been canned successfully: Asparagus, beets, beans—string and lima; Boston-baked beans, pork, cabbage, carrots, field and sweet corn, chili sauce, chards, dandelions, Brussel's sprouts, hominy, kohlrabi, peas, potatoes, pumpkins, salsify, squash, sweet potatoes, turnips, vegetable soup, mixed greens, beef, sausage, browned ribs, head cheese, tripe and fish.

We also find the 121,500 quarts of vegetables and meat have been canned for home consumption, mostly in glass jars, by farmers and city gardeners.

We have a few members, who live on the farm, have been canning for market. Besides doing every day work they have averaged 625 cans per day for market.

This work is pleasant and profitable, cuts down the high cost of living besides furnishing the family with a well balanced ration at all times, eliminates the drug bills by insuring better health to all.

We agree with the government workers that to take care of what we have to prevent loss is the best way to reduce the high cost of living.

Each member of the club seems to realize that the $15 spent for their Steam Pressure Canner was the best investment they ever made.

Grace Dietz,
Secretary Nat'l Home Canners Club,
Lancaster County.

Vegetable Soup

Any one who is successful in canning tomatoes will be able to use this receipt even in the ordinary way of canning.

We all know how hard it is to have a variety of fresh vegetable soup and know how much time it takes to prepare the vegetables each time you desire to have vegetable soup.

You will find that to open a jar of canned vegetable soup and simply add your meat stock will be very handy. We have some of this soup in the cellar now put up a year ago—and it is just as good as it was the day we made it.

If fresh tomatoes are gone—we mention this because they are gone by the time the carrots are ready for use. Slice cabbage, dice carrots, onions and cut celery in quarter-inch lengths; blanch each vegetable separately after being prepared as described above in a small cloth sack which is dropped into a kettle of boiling water; after the water again reaches the boiling point leave vegetables in the kettle three minutes then remove and place the sack of vegetables in a pail of cold water and allow to chill through.

Take each vegetable and place in separate pans and cover with boiling water, salt to taste and boil until tender. Mix the cooked vegetables in the following proportions, using the liquid in which they were cooked—2 quarts cabbage, 1 quart carrots, ½ quart onions, ¼ quart celery, 1 quart ripe tomatoes (cooked); boil briskly one-half hour to blend flavors and seal—never add anything starchy for ordinary canning of this soup."

Grace Dietz,
Secretary Nat'l Home Canners Club,
Firth, Nebraska.

Canning Corn

The following recipe for canning corn comes from Mrs. J. Ed Hall of LaMont, Mo., whose entry of canned corn at the Missouri Home-Makers' Conference, exhibit of Pantry Stores, during Farmers' Week, scored 100 points:

"Take perfectly fresh corn, and before it begins to toughen rub off the silk with a stiff brush and with a sharp knife take off the top of the grain and press out the pulp. Have your jars perfectly clean and well sterilized; fill them with the corn, pressing it in firmly, to within 1 inch of the top—the milk will fill up the space to the top. Add a teaspoonful of salt to each quart jar, put on top and fasten down with spring.

Place the jars, as many as you can without crowding, into a clothes boiler which has a false bottom. This can be made of wire netting and is absolutely necessary, as the jars will break if placed directly on the bottom of the boiler.

Put in cold water sufficient to come up on the sides of the jars and place on the stove. Let come to a boil and keep boiling constantly for 4 hours, if quart jars. If half gallon jars are used, boil 5 hours.

Remove from water and set in a good place in the pantry for ten days then if everything seems right and lids are tight, they may be put in the cellar.

Mr. and Mrs. J. Ed Hall are the good people who are offering the $10 prize for the six jars of canned vegetables.

V. M. in her inquiry for the cause of her bread souring fails to state how she cares for the bread; if shut up in a close box or drawer during the continuous damp weather it would naturally take on a musty flavor, which would not be present if kept in a thin towel and placed where there was a good circulation of air.

The fact that the first two loaves were good goes to prove that it was time and conditions that changed the flavor rather than any inherent cause in the yeast and sponge.—M. R.

Prince Albert just does this little old thing:—

Copyright 1915 by R. J. Reynolds Tobacco Co.

Constantly, men who have earned their spurs as smokers are being chosen members of the Prince Albert "Old Time Jimmy Pipers Club." Here is J. H. Hill, of 208 W. 82nd Street, New York City, who has known the daily joys of a jimmy pipe since he was 17 years old. Mr. Hill is enjoying his sixty-seventh summer.

puts a jimmy pipe or makin's cigarette into your mouth with a brand-new idea of how joy'usly good tobacco smoke can be! Fire-away any hour of the night or day with P.A., it's so good, so cool, so full of kindly flavor and fragrance. The patented process takes care of that—and *cuts out* bite and parch. Quick as you can, you get some

PRINCE ALBERT

the national joy smoke

It certainly *is* the brand that's *all there*, no matter *how* you smoke it, *when* you smoke it, or *where* you smoke it! Just puts sunshine into your spirits the whole day long. Can't hardly wait, sometimes, till you can fill up that friendly old pipe or roll a cigarette!

Just you *find out for yourself* that Prince Albert excels, in flavor, coolness and all-around smoke-joy the most cheerful thought either we, or its most enthusiastic friends, could express.

Buy Prince Albert everywhere in toppy red bags, 5c; tidy red tins, 10c; handsome pound and half-pound tin humidors—and—that classy pound crystal-glass humidor with sponge-moistener top that keeps the tobacco in such fine condition.

Cook's Great Offering

Thursday, October 7, will be a red-letter day in Poland China circles. This is the date claimed by Ed. W. Cook, Pattonsburg, Mo., for his first sale of strictly first-class Polands.

Perhaps no sale will be looked forward to with greater interest—especially among those who have watched the founding of this herd.

When a man goes out to the big sales and buys one or two, or perhaps three, good sows he attracts attention to his herd, but when he goes out and buys fifteen or twenty top sows, all eyes are centered on his herd in a powerful way. This is just what Ed Cook did—he bought two or three top sows—and then, ten or twelve more. Mr. Cook did not merely top sales in the matter of price—be topped them in individuals, and few breeders can show a better lot of herd sows, any way you take them. After the sows were purchased Mr. Cook set about looking for a suitable herd boar and he exercised the same care and judgment displayed in his sow selections. The boar he finally purchased is a son of King of Wonders, one of the best boars in service in Iowa, and is out of Big Joe's Success by Big Joe.

We have watched the development of this boar ever since he was placed in the Cook herd, and we are frank to say that in every particular he has met Mr. Cook's fondest hopes. King Joe, the boar in question, is now two years old, and if there ever was a two-year-old boar that would weigh 1000 pounds King Joe can turn the trick. He has extreme length, and depth, massive bone, and withal, is one of the smoothest big boars of the breed. King Joe would be a great boar because of his extreme size and quality, but when one sees the class of pigs he sires, one likes to think of him as a great sire. The second boar in service is Bob the Wonder 72214 by Big Bob, out of Long Big Model by Big Wonder. This youngster promises to develop into a boar of extreme size, and he is siring the right kind. Two and two make four, and likewise two great boars used on great sows produce great pigs.

Mr. Cook has been getting ready for this sale for three years and has persistently refused to price his best stuff—and now he finds that he simply must cut down his herd, and accordingly he has selected for sale an offering that merits the attention of those who want as good as the breed affords. The sale will include fifteen of the private herd sows, six yearling boars, twenty spring gilts, and ten spring boars. Taken as a whole we doubt if any sale will offer as many really good tried sows and yearlings as are cataloged for this event. Most any one would be an attraction. Jumbo Wonder 2nd, by A. Wonder, out of a Jumbo dam, is a litter sister to the sow U. S. Byrne paid $400 for. She is an 800-pound sow and smooth. She sells with a litter by Bob the Wonder.

Belle Jumbo by Big Jumbo II sells with a litter by King Joe. This sow has extreme size and bone and perhaps will be as good as will be sold this year. Belle Jumbo together with her litter will put one right in the hog business. Big Lady Jumbo is one of the litter that sold in H. B. Walter's sale last fall for $1530. She is by Long Jumbo out of Big Lady Wonder by Long Wonder. Big Lady Jumbo sells open. Lady Josephine, Miss Big Joe, and Big Josephine are three crack spring yearlings by Big Joe and are out of Lady Giantess Wonder by A Wonder. Jumbo B and Jumbo C by King of All and out of Jumbo Wonder 2d are spring yearlings that are 700 pound sow prospects. In short, if we named all the fifteen good sows that sell, we would

CLYDESDALE HORSES

Clydesdale Horses, Jacks and Jennets

Clydesdale Stallions, Mares and Colts, with quality and breeding, for sale at lowest prices. We also breed Jacks and Jennets and sell them as low as the lowest.

HIGHVIEW FARM F. L. CROSBY, Prop., Mexico, Mo.

RED POLLED

RED POLLED CATTLE

HERD ESTABLISHED 16 YEARS

Young stock for sale at all times. Young bulls for sale sired by Logan 13500. The duel purpose kind.

M. L. Snyder - Polo, Mo.

simply give fifteen reasons for attending this sale.

The six yearling boars furnish excellent herd boar material and merit the attention of any one in the market for something good. They are all sired by King Joe, four of them are out of the great sow Jumbo Wonder 2d, and two are of Princess Expansion. Among the ten spring boars listed are six by King Joe and two by Bob the Wonder. Two out of Wonder's Queen and by King Joe are extra good. The spring gilts, litter mates to these boars, show extreme size and bone together with smoothness, and the buyer who can't find what he wants among them will be hard to please.

Remember this sale is first class in every way. Cook has the goods to back up every statement, and it will be a long time before you have a better chance to buy this class of stuff at your own price. Send at once for the catalog and arrange to be there. R. P. Royce will represent this paper and will be glad to look after the bids of our readers who are unable to attend. Please mention this paper when you write.

100 Pigs to Show In Duroc Futurity

Geo. E. Thomson, treasurer of the Missouri Duroc Jersey Breeders Association, advises us that over one hundred pigs have been entered in the futurity show to be held at the Missouri State Fair. This is the first year of the futurity and such large entries are a distinct credit to the officers of the above association. Prof. L. A. Weaver of the College of Agriculture will judge the futurity.

The Austin Angus Cattle Dispersion Sale

On Thursday, October 5, at the fair grounds, Carrollton, Mo., J. W. Austin will close out his herd of Aberdeen-Angus cattle. Mr. Austin's eyesight has failed and it is impossible for him to give his pure-bred herd his personal attention. There are 115 head listed, of the five most fashionable families known to the breed—Blackbirds, Pride of Aberdeen, Queen Mother, Drumin Lucy, and Nosegays. Every one of these families has done much to make history for the breed. The latter family is noted for the very heavy milers it has produced as well as the good individuals. The herd has been developed along constructive and progressive lines as near as nature would permit to maintain the high standard of the animals. Bulls of the very best blood lines and merit have been used in the herd for 20 years and the tabulation of the pedigrees for the catalog shows many of the most renowned animals. There are 28 bulls listed, including the double bred Blackbird bull Blackbird Monarch A, a grandson of Prince Ito and Black Magic—of the same family that such great bulls have come as Gay Blackbird, Black Knight of Estill, Lord Woodlawn, Blackbird Jim, Woodlawn Black Lad and many others. He is in fine form and will make good in some other herd of pure-bred cattle. The other 27 bulls are in nice form to begin service and they will range in age from 8 to 20 months. Several very nice herd-headers can be selected and there are others that will please the farmer or the rangeman who wants to produce the market topping steer. The 87 cows and heifers are the kind that when once seen will please. Developed as they have been, almost the year in and out, on the best of bluegrass, no one need have the slightest fear of them not being able to make good. Many valuable matrons will pass into new hands sale day that have been priceless heretofore. Several of the cows will have calves at foot. The offer is free from old cows that have about done their life work. Everything of breeding age has been bred to Blackbird Monarch A and the young things not yet old enough to breed will be found most attractive and will make good foundation stcok. This herd is one that has been a money-maker and who ever invest in them sale day will find that they will give them good returns on the investment. Send for catalog and mention his paper.

Grade Angus Herd for Sale

Look up the advertisement of Delia Rehn, Crocker, Mo., in which is announced that her entire herd of grade Angus cows and heifers, together with the herd bull, must be sold. Mrs. Rehn writes that her reason for selling is due to the fact that her son has been offered a good position outside the state and that the cattle must be sold before he can leave. Here is a good opportunity for South Missouri readers to buy a profitable producing herd of grade Angus worth the money. Write for prices.

Goodspeed & Son's Chester White Sale

MARYLLVILLE, MO., WEDNESDAY, NOVEMBER 3

30 BOARS -:- -:- -:- -:- -:- 20 GILTS

Our offering includes 28 spring boars and 20 spring gilts. All of March and April farrow. Sired by my 1000-POUND TWO-YEAR-OLD, SWEEPSTAKES GIANT 25957; the Iowa Champion, Wildwood Prince and Iowa First, out of sows of the most approved breeding.

We believe that we are offering more size and quality than ever sold in Missouri. Bred for size and fed for size.

TWO HERD BOARS SELL

MISSOURI'S GREATEST POLAND CHINA SALE

PATTONSBURG, MO., THURSDAY, OCT. 7

50 HEAD OF GUARANTEED ATTRACTIONS

This is my first sale and I am proud to invite the public to attend this sale and bid on this magnificent offering. In no other sale will be found as many real high class attractions. This is not said boastfully, but is a plain statement of fact. Almost any one cataloged would be an outstanding attraction in the average sale.

15 PRIVATE HERD SOWS

Included in the lot are some of the top sows of the breed. **JUMBO WONDER II** by old **A. WONDER**, dam **LADY JUMBO**, sells with litter by **BOB THE WONDER**. **BELLE JUMBO** by **BIG JUMBO II** sells with litter by **KING JOE**. Both are real 800-pound sows. **BIG LADY JUMBO**, one of H. B. Walter's $1530 litter. Three spring yearlings by **KING JOE** out of the great sow **LADY GIANTES WONDER**. Other choice sows and yearlings by **BIG BONE CHIEF, KING OF ALL, BIG BEN, BIG MASTIFF, BIG SMOOTH PRICE.**

Six Top Yearling Boars

All by **KING JOE**—four out of **JUMBO WONDER II**, two out of **PRINCESS EXPANSION**. There is certain herd boar material here. Save railroad fare by attending this sale.

King Joe by King of Wonder Heads My Herd

KING JOE is pronounced by all to be among the best young boars of the breed and if you want to see a smooth 1000-pound 2-year-old boar, take a look at **KING JOE**. King Joe at 20 months old weighed 825 pounds, stood 40 inches high, 77 inches long, 72 inches, heart and flank. **King Joe is bred right and breeds right.**

Ten Early Spring Boars

Here are ten tops. Sired by **KING JOE** and **BOB the WONDER** and out of several of my best sows.

Ninteen Crack Spring Gilts

Every one a certain brood sow prospect. Size and bone and quality to suit the most critical.

This sale will not be surpassed in size and quality. Arrange to be my guests October 7. Write at once for handsome catalog.

ED. W. COOK, PATTONSBURG, MO.

COL. H. S. DUNCAN, Auctioneer **R. P. ROYCE, Fieldman**

Dickerson's Spotted Poland China Sale

Look up the advertisement of H. T. Dickerson, Jameson, Mo., in which he calls attention to his annual fall sale of spotted Poland Chinas to be held at Jamison, Wednesday, October 6th, Mr. Dickerson is one of the younger breeders of the popular spotted Poland China, who has built up a herd that ranks up high in the opinion of his fellow breeders. Starting several years ago by purchasing a few top sows from the better known herds he has gradually increased his herd until he is able to select for the coming sale about sixty head, consisting fo twenty-five spring boars, twenty-five spring gilts and ten fall and summer yearling gilts. The writer visited this herd last week and found the sale offering to be such as will interest any of our readers who are in the market for a few of the old-fashioned, spotted kind.

Mr. Dickerson has endeavored to produce a type of hog that will meet the demand for efficient pork producers, and while he has insisted on size and bone, he has not lost sight of other essentials, namely, quality and prolificacy. Everything cataloged is bred deep in the blood lines most popular. Most of the lot is sired by one or the other of the two boars, Spotted Chief 65306 by Pawnee Pete, and by Spotted King 66978 by Longfellow 62829 by Hoppe's Big Chief. Several of the yearlings are by Spotted Mike, a good son of Lamar Chief, one of the best sires of spotted Polands in the state. Several of these yearlings are good enough to go into any herd. Several litters are by Lucky Judge, Cainesville Boy and Good Enough 56907, three of the best known boars of the Corn Belt. The dams of the offering are choice sows carrying the blood of Budweiser, Clipper, Lamar Chief, Lucky Judge and others.

Mr. Dickerson has handled this stuff intelligently and will be able to offer a superior lot. Everything sells open with the privilege of breeding. Write at once for the catalog and kindly mention this paper.

Baker & Son Buy New Boar

In a recent letter from W. A. Baker & Son, Butler, Mo., they have the following to say: We have just returned from an automobile trip to Page County, Iowa, where we went in search of a herd boar. We saw a lot of good ones, but believe we got the best when we purchased a fall yearling from John B. Lawson. This boar is sired by Big Long Jumbo and is out of a dam by A Wonder. To our mind, he is an outstanding boar and we feel that we have strengthened our herd materially. We will be "on deck" at Sedalia and will be glad to have all Missouri Farmer readers visit our herd."

Messrs. Baker have one of the good herds of the state and we take pleasure in referring our readers to the advertisement elsewhere in this paper.

A Capital Poland Offering

N. R. Riggs will hold his annual sale at Lawson, Mo., on Thursday, October 7, and at that time will offer a very desirable lot of Poland China spring boars and gilts of strictly big type breeding. We saw the offering a few days ago and in point of uniformity and size it will be hard to equal.

Mr. Riggs has been in the business for a number of years and has perhaps given as much study to the production of swine as any breeder in the state. We have been visiting this herd for three years and it seems that each year Mr. Riggs produces a better lot than the year before.

The sixty head to be sold are all of February and March farrow and will include thirty boars and thirty gilts. Most of them are sired by Mr. Riggs' good herd boar, Jumbo Orr 178083, by Missouri Lad by Big Prospect, out of a Long King dam. Jumbo Orr has proven to be one of the most consistent sires owned in the state and the class of young stuff by him offered in this sale is added proof of his ability to produce the kind that the buyer wants. Several litters are by Long Superior by Big Superior's Equal, Iowa King and Big Superior's Equal. The dams of the offering are sows possessing unusual size, and quality, that have been retained in the herd because of their marked prolificacy. Buyers will look a long time before they will find a more uniform lot to bid on. Mr. Riggs says he never had pigs do better and that by sale time these February and March boars and gilts will average 220 pounds. We take pleasure in calling your attention to this sale and would urge that you write for the catalog. Please mention this paper.

Thomson Bros. Ship Durocs to Florida

Thomson Bros., Columbia, Mo., recently shipped four yearling gilts to the Everglade Sugar and Land Co., Miami, Florida. These gilts were exceptionally high class and will do much to extend the influence of this herd throughout the South. Included in the shipment was a daughter of Crimson Chief Again by Crimson Wonder Again, and out of a Col. Gano dam, one was an extra good Commander Chief gilt out of a Crimson Wonder Again sow, one was a toppy daughter of Golden Model 34th out of a Col. Gano dam, and one was by Col. Wonder II, the prize winning son of Col. Wonder.

Messrs. Thomson are enjoying a nice trade for breeding stock from their herd and we would suggest that you write this firm for prices before you place your order elsewhere.

See the Giant 72083 at Missouri State Fair

Notice the change in Will G. Lockridge's advertisement in this paper. Mr. Lockridge wants every reader of this paper who is interested in bigger and better Poland Chinas to visit his exhibit at the State Fair at Sedalia, and see his great young boar, The Giant 72083. Mr. Lockridge writes that The Giant will not be fitted for show but will be there in his every-day form. This boar has attracted about as much attention as any young boar in the state and promises to figure strongly in the development of the breed in Missouri. The Giant was sired by Hercules 68356 the noted son of Big Ben 61935, and is out of Colossal Giantess by Colossal. The Giant promises to develope into a boar of extreme size—when he was nine months old he weighed 400 pounds and measured 65 inches from between the eyes to root of tail, and stood on a straight 10½ bone. In Mr. Lockridge's winter sale sows bred to this boar averaged $57.

You will want The Giant represented in your herd and Mr. Lockridge can furnish a number of cracking good spring boars and gilts. Get his prices. Don't forget to look this boar up at the State Fair.

WELLS & NELSON, Auctioneers; R. P. ROYCE, Fieldman

TwentyDuroc Gilts for Sale

Notice the change in the advertisement of R. L. Hill, proprietor of the Adenhill Duroc herd, Columbia, Mo., in which he offers twenty choice March gilts.

These gilts are out of Missouri Lady Again, she by Crimson Wonder Again and out of the $405 brood sow, Missouri Lady.

Missouri Lady Again was first in her class at the Nebraska State Fair in 1913. Her litter brother was first in under year class, and her two litter sisters second and sixth in their class. The litter was first in herd under a year; first in Nebraska special offered by the National Duroc Jersey Record Association, and won the silver cup given by the National Duroc Jersey Record Association. Missouri Lady Again is a great brood sow and decidedly prolific. She farrowed 13 pigs on March 13th, and we are offering five of the gilts for sale, sired by Col. Wonder II.

A few of the March gilts sired by Col. Wonder II are out of Golden Model's Maid, she by Golden Model 30th, he winning in 1912 2nd at Iowa, 1st at Minnesota, defeating the hog that won 1st at Iowa, 1st at South Dakota, again defeating the hogs that won 1st at Iowa and 3d at Sioux City. Her dam is May Crimson by the grand champion Crimson Wonder Again. She is the biggest sow in the herd, and has never farrowed less than 11 pigs to the litter. Her spring gilts by Col. Wonder II are the big kind with quality, and a nice even bunch.

There are several March gilts by Col. Wonder II out of Columbia's Beauty, the good sow by the three times champion, Beauty's Model Top and out of a Defender dam. Here is a line of breeding that is very popular, and the gilts from this litter will please particular buyers.

Miss Col. Bob, another big and prolific brood sow by the good breeding boar, Col. Bob, is the dam of a nice bunch of March gilts by Col. Wonder II Miss Col. Bob is also very prolific, a good mother, and always raises a good bunch of pigs. A gilt out of her and by Col. Wonder II will make money.

Write Mr. Hill for prices and mention this paper.

ANDREWS STOCK FARM

Annual Sale of Spotted Poland Chinas

Lawson, Mo., Thursday, October 14, 1915

50 Tried Sows Yearlings Spring Gilts Spring Boars

50 Tried Sows Yearlings Spring Gilts Spring Boars

Following my usual custom I will offer at public sale a superior lot of old-fashioned, big boned Spotted Poland Chinas from my well known herd. Fifty head will be cataloged and will include 14 SUMMER AND FALL YEARLING GILTS; 20 SPRING GILTS; 15 JANUARY, FEBRUARY and MARCH BOARS. Sired by the great boars, SPOTTED JUMBO and SPOTTED KING. In addition, I am putting in for attraction 2 TRIED DAUGHTERS OF OLD BUDWEISER. SEND FOR HANDSOME CATALOG

ANDREWS STOCK FARM - - - Lawson, Mo.

P. M. GROSS, CHAS. R. THOMPSON, Auctioneers R. P. ROYCE, Fieldman

Andrews' Spotted Poland China Sale, October 14

Our readers' attention is directed to the advertisement of the Andrews Stock Farm, Lawson, Mo., announcing that the annual sale of this well known firm will be held at Lawson, Thursday, October 14. For several years past this sale has proved to be an event of more than passing interest to those in the market for Spotted Poland China breeding stock and this year's offering should be no exception. We have been in close touch with this herd for the past three years and feel that we are rather familiar with the line of breeding found in the herd. We have seen many breeding animals sell in these sales and we know that they make good for the buyers. Only recently we saw a boar that was purchased in last year's sale to head a herd and we know of no better young Spotted boar in the state. Mr. Andrews insists on size and knows that it takes more than breeding to develop size and because of his ability as a feeder he is able to offer a highly desirable class of stuff.

The two herd boars, Spotted King and Spotted Jumbo have been largely responsible for the success of the herd. These two boars were very much of the same type—boars with plenty of size—not the largest—heavy bone, width and depth, and bot hshowing excellent quality. When crossed on the herd sows, all of which were bred along the most popular lines, a very excellent type of pork producer was the result. Spotted Jumbo, the larger of the two boars, died this summer ,and the sale will be the last opportunity to secure his blood. Another young boar that has been used in the herd is Spotted Clover 74709 by Spotted Giant 62468, counted by many to be the best spotted boar in the country.

This year's offering will consist of about fifty head and will include two tried sows, fourteen summer and fall yearling gilts sired by Spotted Jumbo, Spotted King and Spotted Mammoth, 20 spring gilts and 15 spring boars of the same breeding. Taken as a whole this year's offering does not includes as many January and February boars and gilts as last year's lot but there are a goodly number of early ones. Among the yearlings are a number of very attractive gilts, and we might mention the yearling daughter of Spotted Mammoth out of Spotted Carwin as being particularly good. The real attractions of the sale will perhaps be the two tried daughters of the great old sire, Budweiser. These sows, Budweiser Girl and Budweiser Lady have been splendid producers for Mr. Andrews and the only reason he is offering them is in order to make this sale a very attractive one. Budweiser Girl sells bred to Spotted Clover, and her litter sister will sell open.

Write at once for the catalog and watch this paper for further details.

HARVEY'S

Annual Chester White Sale

MARYVILLE, MO., TUESDAY, OCT. 5

65 SPRING BOARS and GILTS

The Harvey Kind

On the above date I will offer for public sale 65 Chester White spring boars and gilts, the very tops of my 1915 spring farrow. The offering will afford an excellent opportunity to secure breeding stock of exceptional quality. Sired by such noted boars as

WILDWOOD PRINCE 28531, the champion and grand champion at Iowa last year.

DEMONSTRATOR 27501, one of the largest boars of the breed.

INTERNATIONAL BOY, one of the best boars now living.

The dams of the offering represent one of the choicest collections of sows in the Corn Belt.

Write for catalog, mentioning this paper.

J. H. HARVEY, - Maryville, Mo.

THOS E. DEEM, Auctioneer

Frost's O. I. C's

For over thirty years the name of Frost has been associated with O. I. C. hogs, and this name has been regarded by many as synonymous with quality. The herd was founded by Judge L. L. Frost, of Mirabile, Mo., and it remained his sole property until October, 1912, when the present firm of S. D. & B. H. Frost was formed. The Spring Grove and Caldwell County herds have an enviable record in producing both show and breeding animals of high order. It will be recalled by many that this herd made a remarkable record at the World's Fair at St. Louis—almost cleaning the boards.

At present a number of attractive fall boars are for sale, and the top spring boars and gilts of the 1915 farrow. Our readers will like the kind Messrs. Frost are producing and we know their prices will please. Mention this paper when writing.

Last Call for Harvey's Chester White Sale

This is our last opportunity to call attention to J. H. Harvey's annual Chester White sale to be held at Maryville, Mo., Tuesday, October 5. These Harvey sales have come to be events looked forward to by breeders and farmers who are in the market for choice breding stock, and each year it seems that Mr. Harvey is able to improve on the previous offering. This fact is evidence of his ability as a constructive breeder, and is further evidence that his herd is improving. Last week the writer visited this herd and was pleased to note the general high character of the spring boars and gilts that are being prepared for sale. The offering throughout is very uniform, has been well grown by intelligent feeding and we believe exhibits a bit more bone than last year's lot. The major portion of the offering is sired by International Boy, a splendid boar that stood at the head of Mr. Harvey's herd until a long priced offered by J. J. Wills, Platte City, Mo., caused him to sell. Barber Girl 42882 C. W. R. furnishes a capital litter by International Boy. Barber Girl is one of the best producing sows in the herd. Harvey's Perfection 59084, Anna 50688, Minnie Ha Ha 59088 and the great old sow, Peach Blossom, all have litters by International Boy. Several litters sired by Demonstrator 27501 show unusual bone. Hiland Kind 69058, one of the best young sows we have seen in years, is the dam of a remarkably good litter sired by Wildwood Prince, the Iowa champion last year.

In all, 65 head will be sold and will in-

S. D. & B. H. Frost will exhibit Chester Whites at the State Fair.

DISPERSION SALE OF HIGH-CLASS ABERDEEN-ANGUS CATTLE

Carrollton, Missouri, Tuesday, October 5, 1915

115 Head 28 Bulls 87 Cows and Heifers **115 Head**

This is without question one of the greatest offerings of Aberdeen-Angus cattle that has ever been booked for sale in the great state of Missouri. The consignment represents five of the most fashionable families of the breed: **Blackbirds, Pride of Aberdeen, Queen Mothers, Drumin Lucy,** and **Nosegays.** (This last family has long been noted for the very heavy milkers it produces.)

Twenty-eight Bulls are listed, including the double Blackbird bull **Blackbird Monarch A 168334,** a great grandson of the mighty **Prince Ito** that holds the record price, $9100. He has been used in the herd with most satisfactory results. Among the other bulls listed are several herd-headers and there are plenty for the farmer or the cattleman who wishes to produce baby beef. They will range in age from 8 months to 20 months old. They are now in the very pink of condition to begin service. The ranchman will find them the kind of bulls to please and make good.

The eighty-seven cows and heifers wear the very stamp of approval. Many valuable matrons will pass into new hands on the day of sale. All will be found in tip top breeding condition. Several cows will be sold with calves at foot. Everything of a breeding age will have been settled to the service of **Blackbird Monarch A.**. Heifers that have not been bred are well developed and will please any one who is wanting young things. The cows in this herd have been money-makers and will give good returns to the party who invests in them at this sale.

The individuality and blood lines of the whole offering is such as will meet with the approval of the old breeder or new beginner who wishes to start a herd of pure-bred beef cattle.

This sale will take place the second day of the American Royal Live Stock Show and there being no Angus sale at the Royal this year, I cordially invite every breeder, farmer, cattleman and rangeman to attend this public auction and secure some of the bargains. Where there are so many cattle sold in one day there is no doubt that at times the sale will lack support. For a catalog and other information about the cattle to be sold address

J. W. AUSTIN - - - - - - - CARROLLTON, MO.

M. A. JUDY, Sales Manager, West Lebanon, Ind.

COL. SILAS IGO, Auctioneer **R. P. ROYCE, Fieldman**

clude the top spring boars and gilts of the herd. We commend this offering to our readers feeling that it will afford a splendid opportunity to select a future herd boar or sows that will develop into valuable additions to any herd.

When you buy of Harvey you get more than just a registered animal—you get one that is the result of years of careful breeding and selection. The catalogs are ready to send out and will be mailed to all who ask for one. R. P. Royce will attend the sale in the interest of The Missouri Farmer readers and will handle any bids sent to him.

Goodspeed & Son's Chester Whites

F. B. Goodspeed & Son, Maryville, Mo., will hold their first public sale of Chester Whites from their Pleasant View herd on Wednesday, November 3rd.

This herd has not been before the public long, but what it lacks in years is more than made up in quality, and from now on is bound to figure strongly in the progress of the breed in this state. The foundation breeding stock was secured from such herds as J. H. Harvey, B. M. Boyer & Sons, and other leading breeders. The senior Goodspeed is a very critical judge of livestock and knows what he wants and will purchase only such animals as come up to his standard. Further, he is admirably situated to raise hogs of the highest type, having one of the good farms of Nodaway County on which alfalfa and corn are among the staple crops. Last week, during the Nodaway County Fair the writer had occasion to visit this herd and was impressed with what he saw. The sow division includes daughters of such noted boars as Jumbo 2nd, Chief Select, Seldom Fed, Silver Lad, New York's Pride, Rustler, International Boy, etc. At the head of the herd stands the best two-year-old Chester White boar we have seen in Missouri, Sweepstake's Giant 25957. This boar was two years old last March and in his every-day clothes tips the scales at 905 pounds, and could easily carry 250 pounds more. Sweepstakes Giant was sired by the grand champion, Sweepstakes 28006, and is out of Goldie 3rd 26048 by the great boar Jumbo. Sweepstake and Jumbo were 1200 pound boars. Sweepstake's Giant is not just a big boar —he is good most every way. He has a typical head and ear, great length and width with corresponding depth; carries a good strong back, stands on excellent bone and feet, and is wonderfully smooth for so large a boar.

The sale offering will consist of fifty head, including thirty boars and twenty gilts of March and April farrow. We have seen a great many herds during the past few months but we have get to see a herd that can show more size than the Goodspeed herd. Most of the offering is sired by the above boar, but there will be three litters by the champion Wildwood Prince, and one by the well-known boar, **Iowa First.** Two older boars are also listed, **one Valley Prince, a September yearling by Grubstake, a son of Sweepstakes and out of Daisy by New York's Pride, will make the buyers set up and take notice; the other Harvest Lad, by International Boy, out of a Jumbo 2d dam, is the kind that will meet with ready appreciation.**

We will have more to say regarding this offer in a later issue. Remember the date is Wednesday, November 3rd, and we would urge that you write Messrs. Goodspeed at once and ask for catalog. Please mention The Missouri armer when you write.

Holstein Bull Calves

S. W. Cooke & Sons, Maysville, Mo., are advertising several very desirable Holstein bull calves sired by a richly bred bull and out of high producing cows. Dairy experts declare that a good bull can raise the production of his progeny 1000 pounds of milk and 40 pounds of butterfat per year above that of their dam. Therefore in selecting a dairy bull it is essential that he comes from producing dams. Several of the calves offered for sale are from cows with A. R. O. records. Mention this paper when you write.

Richards Has Poor Sale

J. F. Richards & Son's Poland China sale held at "Pen-Yr-Hyl" farm, September 8, was a flat failure so far as they were concerned, but it proved to be a regular harvest for the few buyers who were there. A full report will be given next issue.

Bridges Bros. Lose King John

Bridges Bros., Slater, Mo., write that they had the misfortune to lose their herd boar, King John 72135. King John was undoubtedly one of the best Poland China boars owned in Missouri, and his loss means much to the breed in this field.

Record Entry of Senior Bulls

With 29 entries, the two-year-old bull class in the Hereford division of the American Royal live stock show, to be held in Convention Hall, Kansas City, Mo., Oct. 4 to 9, establishes a new record for senior bulls. A search of the records of the American Royal and other leading live stock shows fails to show where this record was ever equalled. While eight monies are offered in this class, it is expected that, because of the large number and high quality of the entries, several additional animals will be placed, and probably extra monies added.

The Hereford entries for this year's American Royal number 352, of which 325 are in the breeding classes and 27 in the steer classes. There will be 28 exhibitors in the breeding classes and eight in the steer classes. The large number of steers entered presages an exceptionally interesting exhibit in this department. The steer recently imported by Col. E. H. Taylor, Jr., of Frankfort, Ky., for the express purpose of "cleaning up" this year's shows will be one of the contestants, and Hereford breeders are eager to learn how he will rank with the home-groun article. George M. Boles of Lubbock, Tex., will judge the Herefords.

60 Boars and Gilts

My offering this year includes 30 boars and 30 gilts of February and March farrow and shows more size than any lot I have ever sold. Competent judges pronounce it one of the most uniform lots seen this year. Size, bone, quality and prolificacy are the foundation of the Crystal Springs herd.

Everything offered is bred in the best big type blood and has been fed to produce size. Most of the lot is sired by my great breeding boar

JUMBO ORR 178083

by MISSOURI LAD by BIG PROSPECT and out of a LONG KING dam.

Other litters by IOWA KING, LONG SUPERIOR, BIG SUPERIOR'S EQUAL. My herd sows are the big, motherly, prolific kind and are daughters of several of the great boars of the breed.

If you need a herd boar or a few gilts I can fit you out in this sale.

THE HOME OF MISSOURI'S GREAT AGRICULTURAL COLLEGE AND THE MISSOURI EXPERIMENTAL STATION

Real Heroes

The other day a messenger boy handed me a telegram. As I tore open the envelope I felt the quickened heart beats with which I always receive these missives that come flying on the wings of the wind and which nearly always imply important news of one kind or another—and nearly always good news or bad. This time it was to be the latter and as I quickly scanned the words they told me that one of the best friends I have ever had in this World, or expect to have, had breathed his last upon the operating table of a great hospital. Since then I have talked to another mutual friend who stood by his side as the surgeons—the most skillful that could be found in a great city—performed their delicate task which, in this instance, was to be the last act in the wonderful drama of a human life. "To the very last" said my friend, "he joked and laughed with all of us. Turning to the surgeons he said, 'I know you will pull me through if you can—and if you can't, I'll simply have to take the count. But don't be afraid. I am tougher than I look and I am going to try to live if I can—for I like the game. But if I have to go it's alright'—and as they applied the ether he laughingly remarked, 'that stuff could smell worse—but if I had my choice I'd prefer a bunch of American Beauty roses'—and, with a smile he sunk into unconsciousness to awake nevermore."

For years this man had filled a position of great responsibility. His mandates affected interests which involved millions of dollars as well as the weal or woe of many men—and although for a long while he had been the victim of an incurable malady, never once have I seen him when the keen, though distressed smile was absent from his kindly face. Often when the pain would overwhelm him I have seen him bury his face upon his desk—and then, after a moment or two look up and say cheerfully, "Go ahead, I am alright, now."

This brings to my mind another incident: Last winter, one evening, I sat in a great Chicago theatre which makes a specialty of high-class pictures and vaudeville. The chief picture on this particular night was one of the most touching I have ever seen and it portrayed a crippled, hunch-backed cobbler—the unfailing friend of the little street urchins who lived in his part of a big city. As I followed the scenes and beheld this almost inhumanly gnarled, twisted and mis-shapen bit of humanity perform little acts of kindness which made him the "Good Samaritan" of the little friendless ones who came to his little cobbler's shop with their tears and troubles, it was with difficulty that I held back a sob—and I am sure I was no exception to many others in the audience. No sooner had the last of the picture been flashed upon the canvas, when a property man carried a little table out to the center of the stage. Then he disappeared for a moment only to reappear an instant later, half guiding and half carrying to the little table, Marshall P. Wilder—the man who had taken the part of the hunch-backed cobbler in the films—and firmly grasping the table in order not to topple over, he smiled a smile which seemed to me to have more sunshine and more human kindness in it than any other smile I had ever seen. When the audience recovered from its surprise it gave him a mighty cheer—and then for a half hour this man whose wit and fun has been heard around the World—this man who had never known a waking hour free from torturing pain—this little maimed and crippled hunch-back told that great audience of healthy men and women how to laugh and be happy and pointed out the many beautiful flowers which grow by the wayside of life if we will only stop to look for them. Several months ago he died and as he passed out of the World he carried a pile of its sunshine, laughter and good cheer along with him. When I think of these poor heroes who drag themselves through life with a smile despite the never-ending pain which is written upon their pale faces, I am reminded of what fault finding cowards the most of us are.

The Little Devil or 8 Horses—Which?

Compare the cost of eight horses with the cost of a Little Devil oil tractor—$850—and don't forget that the Little Devil eats only while working and feeds on common kerosene.

It enables you to plow at the proper time—and the time of plowing has greater effect on crops than any other factor over which a farmer has control—think that over.

Think of one man plowing fifty acres in four days—doesn't that open big farming possibilities for you? And he did it with common kerosene, too. Here is the story, read it yourself.

Elizabeth, Colo., Aug. 11th, 1915
Hart-Parr Co., Charles City, Ia.

Gentlemen:—In answer to your letter, I pulled a Moline plow, three bottom, fourteen inch and plowed from five to six inches deep in ground that had been plowed once about eight years ago, which was practically back to sod. I plowed fifty acres of such land in four days and am very much pleased with the work. I feel satisfied that the engine will continue doing as good, for it is in fine shape. Yours truly.
J. H. CLARK

Mr. Clark is one of many who is pleased with the Little Devil.

This same Little Devil will harvest, run a 29-inch thresher, fill a silo and do all kinds of belt work, up to 22 H. P.

The Little Devil does such good work because it has a valveless motor—powerful and simple. The whole tractor has but seven gears, all made of steel. Ask us to describe this motor—you'll be interested—it's a wonder.

And we want you to know about our drive wheel, a skeleton type wheel built up with "Hold Fast" lugs, which do not pack the ground. They grip the ground like a horse's hoof.

We haven't the space here to tell you all about it, but if you'll send us your name and address we'll give you the whole story.

HART-PARR CO.
381 Lawler St., Charles City, Ia.
The largest builders of oil tractors exclusively in the world.

FOREWORD TO LAW-MAKERS

If farmers would have their own ideas made into laws they should be discussed before the public so as to inform other interests what is needed. And then farmers do not always agree among themselves and a free and full discussion of the merits and demerits of a measure may result in something free from material fault. There is a certain class of legislation affecting farmers only and as a rule the farmer members of the Legislature can get anything they want of this kind of legislation if they can agree among themselves. Farmers do not usually have a very thorough understanding among themselves, which is to their own disadvantage, because with the fifty or sixty members of the lower branch of the Legislature which they hold they should wield a most powerful and wholesome influence on all legislation.

Last year, just before the convening of the Legislature we opened the columns of The Missouri Farmer for a discussion of "Needed Legislation" and as a result of that discussion some strong support was given to the passage of the "Land Bank Bill." One measure that failed which was discussed in our columns was the proposed protection of sheep owners. But the reason that measure failed was because the farmers did not agree and too many measures were allowed to get before the Legislature. So let us begin now and have a free discussion of new laws or changes in our present laws which will aid in the development of our agricultural interests. Are you satisfied with the presten game and fish protection laws? Do you think it is fair to compel the man who owns a sheep or a hog to keep it on his own premises but allow the fellow who owns a dog to let it prowl at will? What do you think about our road laws? Have you not in your experience found something in the road law that does not work well?

We do not want these questions discussed from any selfish or narrow point of view but let us think and talk and work together for the public good. Any question of interest to farmers may be discussed in our columns.

One Farmer Awake

We have just received the following letter along the line suggested in the above article which shows one farmer awake to this subject:

In this connection, why not establish in your paper a department entitled something like "Legislative Needs of the Missouri Farmer" with the hope that possibly it may start a movement that may develop into "National Legislative Needs of the American Farmer." It would seem that many suggestions could be made between now and January, 1917, some of them of such a character that they could be accomplished with a unity of farmers interested. These suggestions as worked up and discussed in this department of your paper could be discussed also to some extent at the Farmers' Week meetings at Columbia in January. A committee appointed at that time could shape them up, select what seemed to be the best, most needful and most likely of accomplishment, get them in shape and make as much publicity of them to the farmers of the state as possible and as far as possible get representatives elected in the various counties who would pledge themselves to try to make such laws in the interest of the farmers. They might in this way go to the Legislature in 1916 with considerable strength and power.

Every class of business interests except farmers work in harmony to secure legislation of their own suggestion for their own interests. They spend money, time and use their best influence to get such legislation enacted—much of it honest and honorable, some of it not, but because they unite to get the legislation and use their best efforts and money for that purpose is no sign the legislation is wrong or corrupt or that corrupt methods are used to get it enacted. And so with the farmers. They are entitled to some legislation in their behalf and they ought to go after it to get it and wont get it until they do.

Take Illinois, for example. Their legislation for some years has been most favorable for labor interests, simply because of the strength of labor unions and the fact that they stood united in their demands. Labor in Illinois is not as strong as farming interests in Missouri.

It is now none too soon to start this work if it is to be started, for things should be gotten in tip top shape in time for use even before nominations.

A. S. Ennis.

Protecting Cottontails

The Field and Farm says:

"The farmers throughout the northern part of the state are up in arms against the cottontail law which stands to protect rabbits in certain seasons. These orchard pests are already feeding on the bark of the young trees, preferring it to all the succulent food available. As a result some of the fruit growers' associations and nurseries have petitioned the governor, the state game commissioner and the county commissioners to permit the killing of cottontails before the open season. We know what we would do, law or no law, to a lot of pesky cottontails that were chewing up our trees. This fool statute was fathered by a locomotive engineer who probably never saw a jackrabbit and who certainly had no fealty for the agricultural interests of the state."

We have not gone quite so far in this state with the cottontail but we have with the skunk.

The Difference Is In Specialization

THE TEST OF A TIRE is the mileage it yields. Firestone Tires yield "Most Miles" per Dollar" because they are the product of the highest degree of specialization.

You are familiar with the quality advantages of Firestone Specialization. Extra rubber and fabric, the two-cure process of building, the added inspections—all of which account for the multiplied mileage.

Tremendous volume and Firestone distribution cut cost. You reap the benefit in these low prices.

Send us the name of your dealer and the name and make of your tires and we will send you one

Cementless Tube Patch Free

Good Roads Our Greatest Country Life Problem

By Geo. B. Ellis, Managing Editor

How to get a system of good roads is the most important of all questions affecting farm life.

It is an economic impossibility to build rock roads from every farm to town. Neither is it desirable to do so.

It will cost $4,000 to $5,000 a mile to make a good rock road. In some instances it will cost $6,000 to $8,000 but it is only necessary to rock a few miles for the heaviest traffic near town.

A good dirt road with good culverts with easy grades can be built through any good farming section for $100 to $1000 a mile and the maintenance cost of a dirt road is much less than the maintenance cost of rock roads.

D. Ward King of Holt County, Missouri, has given a practical demonstration for 20 years proving that with only a plow and split log drag a road made of Missouri clay can be made dependable every day in the year—good for buggy, automobile or a heavy load—and at a cost not to exceed $30 a mile for a year. There is no excuse for poor dirt roads in any good farming county in Missouri.

That we may not be misunderstood in what we have to say in this article let us introduce the subject by saying that we consider the question of how to get and to maintain good roads in every neighborhood as the most important problem affecting farm life and farm prosperity that we will have to deal with for a number of years—at least until the question is settled in some permanent sort of way. But while that is true we can not agree with so many enthusiasts for good roads that it is more an economic than a social problem.

When the average man comes to look at good roads from the same point of view he looks upon the matter of providing a better house for his family—as a necessary convenience for the better enjoyment of life, we will then make more material progress in road building. Paradoxical as it may seem, I am not sure but what the average man has looked upon the road question mainly from the social betterment point of view while engineers and road agitators have based their arguments too much on the economic value of good roads to get much of a following among farmers.

Some Common Fallacies

A few years ago a distinguished jurist, who sought the nomination for Governor of this state, made this argument in favor of rock roads in Missouri: "The ordinary farm team will draw a ton of grain to market over the ordinary country road and the same team will draw two tons over a good hard surface road. Therefore, the farmers could sell one-half their horses and mules and save all the expense of keep and apply it on the cost of hard roads." This argument while sound in theory is not in accord with farm practice and hence the eminent judge made little progress with his campaign among farmers. The fact is that farmers are not teamsters, they do little heavy hauling on the road and they know they will need about the same number of horses to do the farm work whether they live on a rock road or an ordinary dirt road.

It is sometimes stated by those who look only or largely from the economic side of the good roads problem that it costs the farmer from 25 cents to 35 cents a ton-mile to get his grain hauled to market over the ordinary dirt road and that this cost may be reduced one-half or more by building good hard roads. This argument does not appeal to the average farmer with any force because comparatively few men in this state, except the dairymen and truck farmers near the cities have much tonnage of farm crops to haul over the roads. The man who feeds his grain to beef cattle or mules is not much moved by the economy argument for good roads because his cattle and mules will market the grain without expense and do it as easily and as cheaply over a dirt road as they will over a rock road. If the corn is fed to hogs it is but an ordinary load over the average dirt road for a farm team to market 200 bushels of corn.

To get this question a little more clearly before us let us consider the cost of building rock roads and the cost of upkeep and see what amount of traffic it will take to make it a profitable improvement. The cost of a good macadam road under Missouri conditions will run probably from $4000 to $5000 a mile. The cost will often exceed these figures but for this calculation we will concede these figures a fair average. The annual interest on $4500 at 5 per cent amounts to $225, and if a macadam road is kept in first-class repair it will take at least five per cent on the first cost to keep it up. Thus if we place road building upon a strictly economic basis we must have traffic enough on every mile of road to sustain a tax of $450. If there is a saving of 10 cents a ton-mile, which we think a liberal estimate, it would take 4500 tons of freight per mile of road to make it an economic saving. Expressed in bushels of wheat it would take 150,000 bushels to be transported over the road to sustain the cost of building and upkeep. This is enough to show our road engineers that it is only those roads bearing a very heavy traffic that will justify the expense of a hard metal surface.

Earth and Rock Roads Compared

Again engineers should know that a good dirt road is even a better road for all kinds of travel except heavy hauling for from eight to ten months in the year than any hard surface road. So the advantages are reduced to the difference between the dirt road and rock road for only two to four months in the year. Good roads' boosters sometimes get so enthusiastic about hard surface roads that they tell us there is a great saving on the "wear and tear" of vehicles, harness as well as horses by using rock roads in place of dirt roads. But every farmer who has had any experience in this matter knows that a vehicle will last much longer used on a dirt road than if used on a rock road. The shoeing of horses is a considerable expense on hard surface roads but amounts to very little on the dirt road. We make these statements not because we are opposed to building hard surface roads where conditions are favorable but because we see the statement so often made that "no road is a good road but a hard surface road." We believe this sentiment is responsible for much of the apathy of communities in road building. This is so because the people know that it is an economic impossibility to hard surface all the roads at a cost of $4,000 to $5,000 a mile (and some will cost much more), but they reason if a dirt road can not be made good there is no use to do anything.

If now we get back to the idea that the good roads question for the average farm community is more largely a social than an economic problem and plan our road building along lines that people are willing and financially able to build, we will then begin to make progress. The well kept dirt road will serve the social needs of the farm community in a very efficient way for 365 days in the year. We make this statement knowing that thousands of good people will dispute its accuracy. But we make the statement because we have seen the evidence. We have seen dirt roads crowned and ditched and persistently kept smooth with the drag that were dependable every day in the year for light vehicles and also for the occasional heavy load that passes over country roads. We make that statement because it is substantiated by 20 years of experience of D. Ward King who has for that time demonstrated that a dirt road can be made dependable for every day in the year and for year after year and with no other implement than a two-horse plow and a split-log drag. Some people object to the dirt road because they say it must be everlastingly repaired. But what of that? We may not have to go over the rock road so often for repairs as we do the dirt road with the drag but the average annual expense for keeping up a rock or gravel road will be greater than the expense for keeping a dirt road in first-class shape all the year round. It is not the average country road that gets a little rounding up once a year with the big grader or which has some brush and dirt thrown in to fill up the holes that we call a good dirt road but it is the road that is well rounded in the center with open ditches

Roads should be built according to the amount of traffic they carry.

kept smooth with a drag so the water will run off quickly. Such a road with good concrete culverts, twenty feet or more in length, will prove both a social and economic improvement for any agricultural section in the state. It is estimated that we have 110,000 miles, or more, roads in this state and we have 277,000 farmers which means that for the average mile of road in the agricultural sections of the state there are two and one-half farmers. It will cost anywhere from $100 to $1000 to put a dirt road in good condition including the small culverts but not including the larger bridges built out of county funds. If $300 a mile is a fair average it means that the first cost of getting a good dirt road is approximately $1 an acre for the first cost and the road can be kept up for not to exceed 10 cents an acre annually. And with this nominal cost every farmer has a good road to school, to church, to his neighbor and to the railroad station. The only thing we need to bring about this kind of roads in Missouri is a better road sentiment and a better system for doing the work. The first step is to make up our minds that we must have good roads and the next step will be to put our road work into the hands of men who will give their whole time to the business of making roads. A crew of men after a few weeks experinece in road building and with the latest improved road machinery to work with will not only do better work but they will do about twice as much as men who take green teams and poor tools off the farm to work on the road.

Some Rock Roads Necessary

While we are convinced from experience and observation that the dirt road can be made to answer the needs of intra-commuity travel and at a cost that can be easily borne by any community, we know there is a small percentage of the road mileage of the state that will carry so much traffic that only some hard surface will answer. Near our cities and larger towns where roads become pactically street extensions and over which must go many heavy wagons every day in the year regardless of the condition of the weather the only road that will give satisfaction is one made of gravel, macadam, concrete, brick or other hard surface material.

These roads will cost, if well built, $4000 and up per mile. But such roads are built through land that is much more valuable than the average farm land and the town people are enough interested to pay part of the cost. Several hundred miles of such roads have already been built in Missouri under the special road district organization. Around towns like Sedalia, Joplin, Springfield, Columbia, Lexington and other good towns the main roads leading in all directions have been hard surfaced and the levy for funds is made to cover the property in the town and the farm property within the district where the roads are built. This plan combined with the special benefit assessment plan which provides for assessing the land according to the benefits of the road, will provide for what rock roads that can be made economically profitable and they can be paid for without unreasonable increase in road taxation. The increased levy for good roads will be cheerfully paid by farmers who learn to value their social as well as their economical value.

Missouri is making some progress in road building, not very rapid to be sure, but a gain that shows an increased public sentiment. Every additional mile of good roads is a standing argument for a system of better roads throughout the state.

PREPARING TO FARM BETTER

A practical course for practical farmers. This is the description that fits the Short Course in Agriculture at Columbia. Twenty years ago the Short Course was established at the University of Missouri. Since then 2,468 students have been enrolled in it. Students have attended the Short Course from every county in Missouri save one. A number of students from other states have been attracted by the good things which this practical course offers.

At the Short Course in Agriculture the largest amount of instruction that it is possible to give is crammed into each term. There are four distinct and separate terms of work that a student can take. During each term he has an opportunity to study from 6 to 8 different branches of agriculture. Each term is seven weeks long and is complete in itself. Two terms are given each year. When a student completes four terms satisfactorily he is given a certificate of graduation. In other words there are four distinct and separate short courses combined and these four together are generally spoken of as the Two-Year Winter Course in Agriculture. A considerable number of students find that it is possible to attend only one term of the Short Course. The majority however manage to attend at least two. This gives them 14 weeks of instruction. A lesser number return for the second year of instruction and at the end are given a certificate. This number is increasing.

Many people wonder what is studied at the Short Course in Agriculture. One studies all there is to teach about practical agriculture. Mr. E. H. Autenreith, a young farmer of Bluffton, Mo., a graduate from the Short Course two years ago, recently said: "Numerous as are the different branches of Agriculture found on a general farm there is none of them concerning which I did not learn something of considerable value which can be put to some practical use."

The students who will enter the first term of the Short Course November 1st, 1915, will study six different subjects. In one of these he will take up a detailed study of the cereal or grain crops and grain judging. In this course he learns the best methods of producing profitable yields of corn, oats, rye and barley and other grain crops. He studies the methods of preparing the seedbed, planting, cultivating and harvesting these crops. Last but not least, he studies the methods of improving them and learns to judge the important varieties of these different crops and how to judge and grade commercial grain. He spends nine hours a week in the study of this. Three hours are given up to lectures and recitations and a general discussion of the subject matter. Six hours are spent in the laboratory where he handles the grains and learns to judge, grade and classify them.

The student also studies farm dairying. This course gives him information about dairying which will be of value to any one engaged in farming. He studies the composition of milk. He learns its value as food and how to separate cream and properly make butter under farm conditions. He learns how to test cream and milk for butter fat and how to test individual cows. Six hours a week is spent on this subject. Two of these are discussions and recitations and four hours are spent in the laboratory actually handling the milk and milk products. In these days when dairying is becoming more and more important in the agriculture of Missouri the emphasis given this course is more than justified.

No course in agriculture would be complete without a study of live stock judging. The student is taught to be thoroughly familiar with the types of the common breeds of live stock. He learns to judge them. That is, he learns to decide which animal of a group is better from the standpoint of work, beef production, pork production, mutton and wool production, milk production and as a breeding animal. He spends six hours a week at this work.

Five hours a week is spent in studying the principles which have to do with the most successful feeding and handling of farm stock. The student is taught which feeds are most digestible and most nutritious. He learns in this course how to select certain feeds to get certain results. What to feed to growing animals and what to feed for the production of meat, milk and work are taught and demonstrated. He studies something of the breeding and marketing of farm stock. When a student has finished this course satisfactorily he knows the feeding value of different feeds and how to properly balance rations.

Each first year student is required to take a course in the handling of poultry, for this fifty million dollar farm industry demands consideration. He learns how to hatch and grow farm poultry, how to feed for egg production and handle the stock for market. Instruction is given in the most economical way of dressing poultry for the market. He learns how chickens should be housed on the farm and how to treat poultry for the common diseases. This is essentially a poultry course for the farmer.

In addition to the courses described above, the student has an opportunity to select another course. This may be a course in Wood-working, Forging, Commercial Orcharding or Breeds of Live Stock. In the first course, the student can learn the principles of carpentry so that he can build ordinary buildings on the farm for himself. He also learns how to properly handle tools. He can do the necessary carpentry work on the farm with much less effort after he has been trained for it. In the Forging course, he can learn to make simple weldings, how to temper metal, and in short to do the things that it is possible to do at home if one has a little forge and home blacksmith outfit. The man who applies himself in this course will be able to save many trips to town for repairs during the season and incidentally many repair bills.

It is possible the student is interested in fruit growing. In that case instead of choosing the course in Forging or Woodworking, he can take one in Commercial Orcharding. Here he is taught how to properly care for an orchard. He learns what trees to plant, how to take care of them including pruning and spraying for this is important and necessary if one wants to get profits from orchards. In addition to all these things he is taught the best methods of marketing his fruit. In these days when an orchard that is not cared for brings practically nothing and the one that is cared for brings a good income this is a dollar making course.

The student who is interested in live stock can take up a more detailed study of the Breeds of Live Stock commonly found on or adapted to use on Missouri farms, if he does not want to take the course in Woodworking, Forging or Commercial Orcharding.

Thus it will be seen that a student in the first term of the first year's work gets instruction on practically every particular branch of farming and is permitted to specialize through the selection of the last four courses described. This plan is followed out more in detail in the second term of the first year and in both terms of the second year. In the Short Course the practical things are emphasized. The student is taught how to make more money with less bodily effort.

The Short Course Literary Society, the University Grange, the University Y. M. C. A. and the Agricultural Club, all have membership open to him. His attention is called to the more important duties of citizenship and he is given training along that line.

The best test of the value of this Short Course to young farmers is that gained by practical experience and we give below statements recently made by Short Course graduates:

"When viewed from a dollars and cents standpoint the Short Course is worth ten times what it actually costs. By applying the principles taught in the veterinary science department I feel sure I have saved in live stock many times the cost of the course."—Dennis Phelan, Allenton, Mo.

"Before I took the Short Course I was working as a farm hand at less than $20 a month. Last year I was tester for the Jackson County Cow Testing Association at $50. Now I am herdsman for one of the best herds in the state, at $60 a month and board."—E. F. Pentecost, Martin City, Mo.

"This course gives you the many years of past experience which has taught others and gives you a chance to begin where others stopped off instead of spending the best part of your life in finding out what should be known in the beginning."—R. E. Higgans, Houstonia, Mo.

"I now have doubled the amount of live stock the place had before I attended the Short Course and it is paying a greater profit than formerly. I do not consider the training I got in the purely practical subjects the greatest value, but have found it of general helpfulness in making me a broader man."—W. D. Ashburn, Farmington, Mo.

The first term of the Short Course this year begins Monday, November 1, it closes December 17. The second term begins January 10 and closes February 26. The second term will not open until the Monday following Farmers' Week. A bulletin for free distribution has just been issued which describes this short course in detail. For further information write to Superintendent of Short Courses, College of Agriculture, Columbia, Mo.

Students use the State Farm live stock to learn live stock judging

HOGGING DOWN CORN

That the practice of hogging down corn is a good one has been shown by tests carried on at many experiment stations and has been demonstrated in actual practice by a large number of feeders.

Eleven trials with hogging off corn at the Missouri Station have shown that there is no better way of finishing hogs than by allowing them to do their own harvesting. This was true considering both the rate and economy of gains.

Some of the advantages of hogging down corn are well summarized by the Iowa Station as follows: (Bulletin 143)

(1) Labor is saved. Four handlings of the corn crop are omitted, namely: (a) husking, (b) cribbing), (c) reloading, shoveling into wagon at a later feeding time, (d) feeding the hogs on pasture or at the yards. These enumerated handlings of the corn crop are modified under local conditions; some simply take the load of corn from the field, if they have an extra wagon, into the hog lot and feed it there, thus doing away with cribbing and reloading.

Two handlings of manure are discounted. The manure is dropped in the fields where it is needed, no labor is necessary to haul it out of the lots and to scatter it. Any animal such as the hog, or device such as the self-binder, the corn husker, or gang plow is welcome under the present existing labor conditions: "Hogging down" has been pressed into service largely because of the extenuating difficulties arising in the securing reliable efficient help to harvest the corn.

(2) Storage charges are saved upon the portion of the corn hogged inasmuch as crib space is not needed. The rats and mice do not get any of the corn that is "hogged down."

(3) Returns are equally as good in pork produced where the hogs gather their feed themselves as where it is hand-fed. It is proposed of course that some pasture or supplement be fed in conjunction with the corn in field as well as in dry lot feeding. Hogs running in the cornfield and having alfalfa, rape or clover pasture in addition with possibly a little supplement depending upon the pasture used are ideally handled to secure a maximum of pork at a minimum expense. The hogs gain more economically and rapidly when in the cornfield properly supplemented than they do in dry lot.

(4) The hogs develop good constitutions with considerable strength and are in excellent condition for quick fattening feed after coming out of the field. Range with its accompanying exercise provides a most excellent tonic; the hogs are healthier than in dry lot feeding and are especially inclined to stretch and develop in the cornfield, building frame and muscle to a large degree, putting them in good shape for a few weeks close-pen fattening.

(5) No manure is lost, practically speaking, as in dry lot feeding; of course this does not apply to pasture. Animal husbandry has not yet been able to devise a system of manurial fertility, conservation which would excel the "hogging down" way. With the almost entire lack of leaching loss we have only that fertility removed from the land which is carried away in the hog's body; which really comprises only a small portion of the corn crop's fertility.

(6) The manure is evenly and uniformly distributed over the field in such a manner as to do the most good without the intervention of human labor. Hogs easily excel the modern mechanical manure spreader. These manurial advantages of "hogging down" mean increased yields as compared to the elevator way of handling the corn crop.

(7) The crop is harvested without waste, the hogs if rightly managed picking up practically every stray kernel of corn. By following up the fattening hogs with young shoats or even with brood sows, the field will be garnered more closely than it would be by the ordinary husker. In truth the hogs turned into the field after the husking is over pick up considerable corn which might otherwise go to waste.

(8) The weeds may be cleared up to some extent. One man especially says, "Quack grass has disappeared permanently since I started "hogging down." One would not ordinarily expect such a happy result as this but nevertheless considerable of the weeds are destroyed.

(9) Hogs may follow up cattle and otherwise save waste. They may clean up after silo filling time, gathering the ears which have been dropped by the corn binder, they may follow the husking machine and garner the waste grains.

(10) Facilitates and encourages the gathering of seed corn early from the standing corn in the field. One practical man puts it this way: "The reason many men do not gather their seed corn early is because they do not like to 'smash' down the rows with a wagon and carrying a sack is tedious, discouraging, sticky business..... With us in half a day two men with team and wagon gather enough seed to plant a hundred acres..... We then turn the hogs in and they efficiently do the rest with much profit resulting directly and indirectly."

(11) Poor stands of corn may be taken advantage of in that rape may be sown at the last cultivation, thus enabling the land to produce a full crop that season; the hogs do the rest.

(12) Brood sows which are to farrow spring litters may be advantageously run into the field after the fattening or other hogs are removed; they gain health from so doing, thriving under the tonic of invigorating exercise and beneficial range.

(13) Fall plowing is sometimes possible if the hogs clean the field up early, thus preventing rush of spring work.

(14) Organic plant matter will be largely added to the land if supplementary crops such as rape, rye, soy beans and cowpeas or the like are sown in the cornfield. The rape stumps as well as the mat of material left from rye or soy beans will discourage washing and erosion to some extent. The "hogged down" stover reverts more quickly to the desirable manurial and fertilizing form of organic matter than does the hand-husked. Quick and speedy incorporation of crop residues into the soil is quite desirable.

(15) Corn is harvested omre quickly.

If such a practice is to be most profitable it must, as in the case with any other method of harvesting, be rightly managed. For best results the hogs should not be given access to the entire field but should only have the run of what they will clean up in ten days or two weeks. If the hogs are limited in this way they will have fresh forage from time to time and will clean the field up much better as they go. For this purpose some kind of a movable or temporary fence must be supplied. A cheap and efficient temporary fence may be made from woven wire by fastening well at each end and then tying to the corn stalks.

Before placing the hogs on the corn they should be gotten on full feed of new corn gradually by starting them on a few stalks and increasing until they are getting about all they will clean up. They may then be placed in the field to do their own harvesting. The hogs should be turned into the cornfield when the dent has just formed in the kernel. They will do better at this stage than if the corn is allowed to get harder. For profitable results it is of importance to supply an abundance of water to hogs on a full feed of corn.

The question of a supplement to the corn which is "hogged down" is one of importance. In sections where crops like rape, or soy beans may be successfully grown in the corn, a grain supplement is perhaps unnecessary. When such crops are not grown it will do doubt pay to feed in addition a small amount of some supplement, like tankage. For this purpose one-fourth to one-half pounds of tankage per 100 pounds live weight per day should give good results. The tankage may be fed either dry or wet in a trough. The Iowa Station reports good results by feeding tankage in a self-feeder and allowing them to eat at will. Their results indicate that hogs will balance their ration about right.

L. A. Weaver,
University of Missouri.

Information on Tractors

In the last issue of The Missouri Farmer appeared the advertisement of the Electric Wheel Co. of Quincy, Ill., which is putting out a splendid small sized tractor suitable for pulling three plows as well as performing a lot of other farm work. In this issue you will find the advertisement of the Hart-Parr Co. of Charles City, Iowa, and we suggest that all our readers who are interested in tractors drop a line to each one of these concerns and ask them for their literature which you will find very instructive. Be sure to mention The Missouri Farmer when you write. Also remember there will be a big Tractor Demonstration at the St. Louis Agricultural Fair, October 4 to 9.

Going to Need a Gas Engine?

If you are in the market for a gas engine we suggest that you drop a line to the Witte Engine Works of Kansas City, Mo., and the William Galloway Co. of Waterloo, Iowa, and ask them to send you their literature. Their advertisements appear elsewhere in this issue. A good gas engine goes a long way as a substitute for a farm hand. You will find the literature interesting and helpful. Be sure to mention The Missouri Farmer.

Spreads Wide or Narrow

Black Hawk Spreader

You have been looking for a manure spreader that has the advantage of spreading wide or the width of the box. The Black Hawk is such a spreader. It gives you an opportunity to do the best spreading under all conditions.

The rear trucks are close enough to the back end to prevent front tipping up when spreading up steep hills.

It is a low down manure spreader with the trucks under the load. It is 41 inches from the ground to top of box.

The horses carry the load easier and there is less strain on the spreader. This means a light draft and more durable machine.

The wide spread attachment operates without the use of a gear or chain.

It spreads 7½ feet wide evenly, and with very little additional draft.

Oliver Chilled Plow Works
Plowmakers for the World
ST. LOUIS KANSAS CITY

Ditching Made Easy

With the Martin Ditcher and Grader

Cuts V-shaped ditch up to 4 ft. deep. Fine for levee work; terracing; cleaning out laterals and bed furrowing.

Sold on 10 days' trial.
Money-back guarantee.
Thousands in use.

Simple—Practical

Nothing to break or get out of fix. Weighs 300 lbs. Does all, and more than the big machines. Pays for itself in a few hours' use. Write for catalog and special introductory proposition.

OWENSBORO DITCHER & GRADER CO., Incorporated, Box 837 Owensboro, Kentucky

LOOK at the LOCK

and you WILL SEE WHY "SQUARE DEAL" Fence is the best fence to buy. Before you buy another rod of fencing, see for yourself why the SQUARE DEAL LOCK makes this the favorite field and stock fence of discriminating farmers everywhere. See how firmly it double grips the one-piece stay wires to the wavy strand wires without cutting, breaking or slipping—how it combines solid strength with remarkable flexibility—how its self-draining shape prevents rust—how it makes

Square Deal Fence

"Stamping Out Hog Cholera"

Is there any Hog Cholera in your neighborhood? Then you should have a copy of "Stamping Out Hog Cholera" at once. It tells you how to keep this pestilence from getting into your herd. This great book is described elsewhere in this issue and by acting at once we will send you a copy free.

VACCINATION FOR THE PREVENTION AND ERADICATION OF HOG CHOLERA.

J. W. Connaway, D. V. S., M. D., College of Agriculture and Experiment Station, University of Missouri.

The great value of properly prepared anti-hog cholera serum in saving hogs from cholera, and as an aid in eradicating outbreaks of that disease has been fully demonstrated. There is, however, much confusion in the minds of many swine raisers, as to when they should vaccinate, and when they should not vaccinate. And with what they should vaccinate, whether with "serum alone," or with "serum and hog cholera virus." The decision of these matters should be made wholly in the interests of the swine raisers and not in the interests of the men who make and sell hog cholera serum and virus, and their agents who make a handsome profit from the vaccinating business, and consequently urge all the farmers to vaccinate all their hogs. The farmers want to save their hogs if in danger, and they want to eradicate the disease from their farms, and from the neighborhood and county and state; but they want to do this in the most economical way. They have found vaccination to be very helpful but they have found it to be very expensive. And they do not want to vaccinate when it is not necessary; or to use large amounts of serum if the use of less expensive measures will save the serum and vaccination bills. They want to get rid of vaccination as well as hog cholera, and do not want to adopt any system that will fasten upon them a perpetual vaccination tax. This viewpoint of the majority of the farmers is the right one, and this is the viewpoint from which the Veterinary Department of the College of Agriculture of Missouri is trying to serve the swine industry of the State. The State has supplied the University with funds for the erection and equipment of good laboratories and quarters for the production of hog cholera serum. And it is believed that with these facilities the University Departments concerned will be able to produce all the serum that is necessary to control hog cholera in the State, if used in a proper way in conjunction with other essential measures discussed in this series of articles. The men connected with the University laboratories are not interested in the boosting of serum, but in the eradication of hog cholera, and the laboratories are run solely for that purpose, and as the work of the University along these right lines becomes more effective, less and less serum will be needed. It is therefore to the best interests of the swine raisers who desire to save their hogs from cholera and to eradicate the disease from their farms and from the neighborhood to co-operate closely with the University departments that have charge of the Hog Cholera Eradication work.

Every Farmer a Stock Holder

Every farmer in the State has stock in the University Serum Farm and laboratories and there is no reason why he should not have the services of the departments that have the hog cholera eradication work in charge, and he can have this service if he asks for it.

The State Serum and Laboratories were not established to compete in a business way with commercial Hog Cholera Serum-virus companies, namely to build up a big serum and vaccinating "business," but for use in conjunction with other important means to eradicate hog cholera, and incidentally to render the need for serum less and less each year. The majority of the swine raisers are in sympathy with this purpose of the University departments, which are engaged in this work. And as they become better acquainted with the plans for the prevention and eradication of hog cholera the co-operation between the farmers and the University will become more effective.

A Heavy Tax on Farmers

The viewpoint of the commercial Serum producers is wholly different from that of the University; with them the production of serum is a "business" run for personal financial gain. The advertising literature of one of these companies which poses as the best of its class shows a marked effort to discourage farmers from adopting the sanitary methods advocated by live stock sanitarians. This literature seeks to impress upon the farmers that there is only one way to secure protection against hog cholera, namely to "immunize all their hogs for life by the use of both serum and virus." A method which ample proof shows spreads and perpetuates cholera, although the vaccinator may save a good percentage of the hogs in individual herds. Whether such advice is given ignorantly or knowingly, the fact remains that if the farmers follow the teachings of some of these business exploiters of serum and virus, the swine industry must continue to pay a large toll to hog cholera and to the serum producers is wholly different commercial vaccinators. But fuller information from dependable sources will in time put the swine raisers straight on these matters.

A brief discussion of "immunity" and the action of vaccines and serums will be helpful to the layman in deciding when and how he shall vaccinate. An animal is said to be "immune" to a disease when it is resistant to that disease when well exposed. This immunity may be "natural" or "acquired." For instance, cattle do not have hog cholera, no matter how badly they may be exposed to the disease. Common observation shows that cattle may occupy the same feeding yards with cholera infected hogs, and eat fodder or corn that has been soiled by the excretions of sick hogs without contracting the disease. Cattle are therefore "naturally immune" to hog cholera. The germs, poisons or virus of hog cholera do not seem to have the power to attack the blood or body tissues of cattle.

Immunity Explained

There are theoretical explanations for this which it will not be profitable to discuss in this paper, but the facts given are known to every feeder of cattle and swine, whatever the explanation of the facts may be.

Another fact that is known to swine raisers is that when hogs have suffered from an attack of cholera, and have recovered from the disease, they rarely suffer from the disease again. A profound change of some kind has taken place in the body of the recovered animal, that renders the animal resistant or immune to a second attack, no matter how severe the subsequent exposure to the disease may be. The immunity gained in this way is called an "acquired immunity." The same is true of a number of human diseases, as smallpox, measles, mumps and whooping cough. When a patient recovers from one of these diseases he is then immune to a second attack.

Observations such as those mentioned led to attempts to produce immunity by the artificial infection of the person or animal, with the germs of the disease, but used in small quantities or modified by heat or other means so as to render the infection less virulent, and less liable to produce a fatal attack. Persons or animals so treated with the living or modified germs gained a more or less prolonged immunity from the vaccination. The immunity so gained is called an "active" immunity.

The explanation for this acquired active immunity or prolonged resistance is that the body cells of the recovered persons or animal has acquired the power to produce "protective" substances that circulate in the blood and counteract the disease germs or virus when these destructive agents are taken again into the body.

The protective substances or antibodies which are produced by the recovered or immune animal, for its own protection, vary according to the disease; a different and specific substance being produced for each disease. The nature of these substances is not well known, but that they exist

The Man in the Multitude

That the human voice may be transmitted across our continent by telephone is the marvel of this age of wonders. Yet the full significance of the achievement is not realized if it is considered strictly as a coast-to-coast connection.

The Transcontinental Line not only bridges the country from east to west, but, by having finally overcome the great barrier of distance, it has removed the last limitation of telephone communication between all the people of the nation.

This means that the voice can be sent not only from New York to San Francisco, but from *anywhere* to *anywhere*—even from *any one* to *any one*—in the United States.

Wherever you are, it is possible to reach any one of our hundred million population. You can single out from this vast throng any particular individual with whom you desire to speak.

To bring this about, the Bell System has spent years and millions, extending its lines everywhere, anticipating the ultimate triumph. It has had the foresight and the courage to unite this great country, community by community, into one telephone neighborhood.

With the Transcontinental Line in successful operation, the established Bell highways make you the near neighbor of your farthest-away fellow citizen.

in the blood of animals that recover from certain diseases has been definitely established. This knowledge has led to the production of the "protective serums." Notable examples are the diphtheria and tetanus antitoxins and the anti-hog-cholera serum.

Length of Time Immunity Lasts

The animal that is to be used for the production of a protective serum for use on other animals, must be "hyperimmunizing bodies in the blood—then stance, although a hog which has recovered from cholera may have a sufficient number of "immune bodies" in its blood to protect itself against a subsequent attack. There are not enough of these protective bodies in a small quantity of the blood—say 20 to 30 cubic centimeters—to protect another hog. It is necessary therefore to treat the immune supply animal with large quantities of the disease germs or virus, so as to stimulate the production of a larger number of the nmmunizing bodies in the blood—then a small quantity of the blood serum will serve as a protective dose when injected into a susceptible hog.

These protective serums do not however produce an immunity that is so prolonged as that which is produced when the animal suffers from an attack of the disease either by contracting the disease in a natural way or from being artificially inoculated with the living germs. This temporary immunity produced by the injection of the protective serums is called a "passive" immunity. The duration of this immunity is variable. The anti-hog-cholera serum produces an immunity lasting from 30 to 90 days or longer, dependent upon the degree of potency of the serum used, the quantity injected, and the size and age of the hog vaccinated. The younger the hog the more quickly it loses its immunity. And experience has shown that young pigs as a rule outgrow the immunity that is produced by the simultaneous inoculation of both serum and hog cholera virus, and frequently older hogs lose their immunity after a time although injected with virus and serum for the purpose of producing a "life immunity" an absolute "life immunity" is therefore not acquired without a very profound reaction such as is caused by an attack of the disease with the development of considerable fever. The hogs must become more or less sick to become "life immunes."

ALFALFA THE DAIRYMAN'S FEED

Alfalfa is equal to bran for milk production. It has been the custom for years for farmers and dairymen in the Corn Belt to buy wheat bran to feed to dairy cows, with other feeds to balance the corn ration; or to furnish the protein required by the cows to produce large quantities of milk. This experiment was carried on by the Illinois Experiment Station for a period of 19 weeks.

Two lots of cows were used, three cows in each lot. For the first period of 9½ weeks Lot. No. 1 was on choice alfalfa hay—all they could eat.

In addition to the alfalfa hay they were fed 6 pounds of clover hay, 30 pounds of corn silage, and 6 pounds of corn meal.

The cows in Lot No. 2 were fed 6 pounds of best clover hay, 30 pounds of corn silage and 6 pounds of corn meal, and as many pounds of bran as the cows in Lot No. 1 were fed on alfalfa.

The only difference in the rations of the two lots for the first period was that Lot No. 1 was fed alfalfa and Lot No. 2 was fed wheat bran.

This experiment was begun on the 3d of December when the weather was very cold. The cold weather accounts for the rapid falling off in the milk production for the first nine weeks. At the beginning of the ninth week the feeds were reversed. Lot No. 1 was changed from alfalfa to wheat bran and Lot No. 2 was changed from wheat bran to alfalfa—the other feeds being just the same as before. You will note that Lot No. 2 when changed from bran to alfalfa immediately went up in the milk production from about 460 pounds to 515 pounds, while Lot No. 1 that formerly had alfalfa and was now on bran went down, and continued below the lot on alfalfa most of the way through the experiment.

This is only one of a number of feeding experiments carried on by different experiment stations at which practically the same results are obtained. Hence, we say that alfalfa is equal to bran for milk prodution. Alfalfa is not only equal to bran for producing milk but it builds up the soil and costs much less than wheat bran. Alfalfa can be produced on any farm for $5 per ton at the most, while wheat bran usually costs $20 to $25 per ton. By growing alfalfa on your land you are keeping your money at home, and at the same time adding humus and nitrogent to the soil, enriching the soil so that you can grow greater crops of grain following the alfalfa. When you buy wheat bran you are sending your money away from the farm, probably clear out of the state. This clearly shows why live stock should be kept on every farm.

P. G. Holden.

THE LAND BANK IS NOT A BUILDING AND LOAN PLAN

Some who have not carefully understood the Gardner Land Bank Bill passed by the last Legislature and which requires an amendment to the State Constitution before it becomes effective have confused this plan with that of building and loan associations. The truth is there is very little similarity between the two plans. In a recent interview Col. F. D. Gardner, the author of the Land Bank Bill, called attention to the differences.

"In the building and loan association every subscriber pays in monthly dues. These accumulated dues are loaned to one subscriber. The Land Bank is not operated on that basis. By issuing bonds, the Land Bank borrows money in the large financial centers of the world where money is cheap, and this money is loaned to the farmer at the rate at which the bonds are sold. The farmer does not have to make monthly payments at all. He simply pays off his loan in annual payments, paying 4.3 per cent interest, ½ of one per cent for reserve, and 1.7 per cent to apply on the principal, making a total annual payment of 6½ per cent, which pays off the loan and interest in twenty-five years.

"In the building and loan association there are hundreds of subscribers who make monthly payments but who are not borrowers at all. It does not issue bonds. It does not bring outside capital in. It has the use only of such capital as the members themselves raise and pay into the treasury, whereas by issuing bonds the Land Bank brings into use millions and millions of outside capital to be distributed in the rural districts. Thus you will see that the great difference in the two plans is that the building and loan association simply utilizes the money of the community, whereas the Land Bank utilizes the money from the great outside reserve centers. The Land Banks are in successful operation in every civilized nation except America. The farmer produces all of the wealth of the nation and in all fairness is entitled to the use of it at as low rates of interest as other people can get it. But the truth of the matter is I, as a manufacturer, am offered money at 3¼ per cent. This money comes from New York and was accumulated from the sale of agricultural products. Now, should not the farmer be able to borrow this money at as low a rate as I can borrow it here in St. Louis when he puts up his farm as security? But I know he is compelled to pay 7 or 8 per cent, counting all expenses.

When the people are thoroughly familiar with this proposed plan which aims to furnish farmers cheaper money which can be used to buy homes, to pay off mortgages, to drain swamp lands, to clear and put into cultivation timber lands and to buy improved live stock and build silos and make other needed improvements then what little opposition there may have been to the plan will disappear.

If any of our readers are not thoroughly familiar with all the details of the Bill if they will write and submit their questons we will try to make it all plain. Any meritorious measure is always made stronger by full and free discussion.

J. T. Mitchell, banker of Centralia, Mo., and bank commissioner of Missouri, said: "The establishment of the State Land Bank, as provided in the Gardner bill, will prosper all classes of people. It seeks to correct unsatisfactory conditions by operating at the source. When the source of all wealth is less embarrassed for funds better conditions will prevail. Country banks do not want long-time real estate loans, therefore will not object as it places more money in their communities and permits them to handle a more liquid class of loans—safeguard of every bank. The Gardner bill is far-reaching in its effects, and a free discussion will impress the public with its merits."

International Harvester Oil Engines—Mogul—Titan

THE buying of the right engine for the farm is a family affair. Your wife, the boys, the girls, the help—everybody about the place will be helped so much by the engine that it pays to buy carefully. Get a good engine, a **Mogul** or **Titan,** give it all the jobs it will do and handle it properly, and it will still be shouldering the drudgery years from now.

Buy an **International Harvester** engine—**Mogul** or **Titan.** In time the family will come to look on it as a faithful ever-reliable friend. It will keep down your fuel and repair bills, deliver the most power with least trouble, and save you more hard work than you can realize now.

International Harvester engines are made in all approved styles, sizes from 1 to 50-horse power, operating on low as well as high-grade fuels. Some local dealer near you handles **Mogul** or **Titan** engines. If you don't know him, drop us a line. We'll send you full information, and make it easy for you to see the best farm engine made.

THE MISSOURI FARMER

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

Vol. VII October 1, 1915 No. 19

William Hirth - - - Publisher
Geo. B. Ellis - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year in Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct, always inclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

ON TRIAL

The Missouri Farmer has from time to time pointed out the benefits that might come to the farmers from the work of a good county agent, or so-called county farm adviser where he had the hearty co-operation of the farmers of the county. Without a close co-operation there can be little advantage in having a man for this work. The plan has been on trial now for about three years in Missouri and some good work has been accomplished but for some reason the organization of new counties is not going ahead like it should if the good things we had hoped for it can be realized.

Some good work has been done by the county agent co-operating with the county school superintendent in organizing boys' corn clubs, girls' canning clubs, home economic classes, etc. One thing that has been of real economic value to the farmers of several counties has been the effort to control hog cholera. This work alone has saved the farmers of a few counties more than the cost of the county agent.

If this movement can stand on merit it is now old enough to show substantial results in its favor, and if it is to move forward as it should we think the agents who have been at work for a year or more should begin to give some publicity to their plans as to what they are able to accomplish. If it is a good thing it ought to be extended to every county in the state, but if it is a failure and does not pay we ought to know it so that our energies may be directed along some other lines.

WHAT PREPAREDNESS MEANS

About the livest topic discussed in the newspapers for the last three or four months is the question of providing a larger army and navy for our national defense. A lot of this discussion favoring big appropriations for the army and navy is without doubt the sincere expression of men who believe that this country would be safer under strong military protection. But a lot of the publicity for military preparedness comes from those who would be directly benefited by such a program. First of these is the organization of the army and navy. Second and more powerful than the first is the combined sentiment of all trades and manufacturers who make money out of war or preparation for war. If this country is in any real danger of attack and the people could be made to believe it was in danger we think there would hardly be a dissenting vote against making our army and navy the strongest of all nations in the world. But it will be pretty hard to make the average citizen who is in the habit of attending strictly to his own business and who finds that by so doing he can keep out of either lawsuits or personal encounters, believe that the American people are in any imminent danger of attack if we as a nation attend strictly to our own business.

It has been stated on the highest authority that out of every dollar expended for any and all purposes by the United States Government that 72 cents of the dollar goes for war and only 28 cents for internal improvements, education, administration of all civil offices and every other line of work the Government is interested in. The enormous losses of both life and property in the European war should open the eyes of every liberty loving individual to the barbarity of so-called modernized warfare. According to figures made public by the Red Cross Society the losses of life for the first six months of the European war was 2,146,000 men killed; 1,150,000 seriously wounded; 3,781,000 slightly wounded; 1,764,000 taken prisoners. Counting only the killed and seriously wounded we have for the first six months of the war a number almost equal to the whole population of Missouri and the losses for the last six months have been very much greater. The cost of the war in dollars is so great that it is incomprehensible to any mind.

We have called attention to this matter merely to impress upon our readers the opportunity they have for exercising their right to express themselves either for or against a system of militarism in this country. Every man should write his Congressman and let that official know just where his constituent stands on this question.

MAKE IT YOUR PAPER

We hope to render such service to the readers of The Missouri Farmer that every one of them will feel like he or she had a material interest in the paper. In the first place we are careful to keep our columns free from any offensive or objectionable matter. Many a young man has recived his first suggestion for an evil life by reading unwholesome papers. The aim of The Missouri Farmer is to be a constructive force for good citizenship as well as for good farming . The motto we carry on our banner every issue is "Better Farming, Better Farm Homes, Better Citizenship." The foundation of it all is better farming and that means reducing as much as possible the hard-man-killing labor that has been too great a part of the old system of farming. We have known many a farmer who felt proud of himself because he had endured many hardships and much physical labor and we honor the man who has done so through necessity, but we pity the man who has done so because of lack of information.

Most any intelligent person can learn how to do a few things well but in a business with so many complications as farming there will be a thousand other things about which precious little is known. Here is where the farm paper can be of some real service. It brings to every reader the best knowledge from time to time that has been discovered by the experiment stations and that has been published by the department of agriculture and other agencies whose business it is to study farm betterment. But we think one of the most valuable services a farm paper can render is to bring its readers in touch with the sentiments, experiences and methods of the farmers of the whole state.

The Missouri Farmer goes to farm homes in every county in the state and we believe our readers are among the most progressive and most successful farmers of Missouri. From time to time we have published splendid articles from some of our readers, some pointing out mistakes that have been made, some giving account of things successful, some giving expression to good moral sentiment and some to a little high-class humor.

The thought we want to get before our readers in this article is that every reader has the opportunity through the columns of The Missouri Farmer to render a real service to his or her state by writing us stories about how they have succeeded, how the home has been made better and the farm work or the housework has been made lighter. Then there are other questions which affect the whole community, the schools, the roads, the farmer's club, the home-makers club, the clubs for boys and girls—if any of these things have been worked out in your home neighborhood we want to urge you to sit down at your first leisure time and write The Missouri Farmer family about it.

Our readers know how nice it is to live in a neighborhood where everyone seems to be working for the good of all along with what he is doing for himself. A state is very much like a big neighborhood and it is made a desirable place to live according to the public spirit and altruistic sentiment of its people. Nature has done a lot for Missouri by giving her a greater diversity of natural products than any other state in the Union but it remains for us to do our part towards giving the state good roads, good schools, and good homes.

HOME MAKING FOR GIRLS

Although somewhat tardy in doing it the University of Missouri is now providing about the same opportunity for the girls to learn home making that is provided for the boys to learn better farming. This opportunity is offered in the seven weeks' Short Course in Home Economics which begins November 1 and ends December 17, 1915.

Practice work is given in the kitchen laboratories, in the sewing and millinery departments and lectures will be given by experts in the various lines of household science. Students learn how to cut and fit garments, how to care for the sick and the prevention of disease, how to plan and prepare meals for the family, and in fact most everything a good homemaker needs to know. Full information may be had by writing P. M. Brandt, Superintendent of Short Courses, Columbia, Missouri.

Important Announcement

It is our hope and desire to make THE MISSOURI FARMER better and more interesting this winter than ever before—and yet the extent to which we will be able to do this will depend in no small degree upon the help and co-operation we receive from our readers. The other day I had occasion to deliver an address at a farmers' meeting in central Missouri—and after I left the platform a lot of farmers gathered about me and almost the first thing each man said was that he "wouldn't do without THE MISSOURI FARMER for anything"—that they "valued it more highly than any other farm paper," etc. Just as a matter of curiosity I jotted down the names of the most of these men and when I got back to the office I found that **all but three were in arrears on their subscriptions!**. I have no doubt that these farmers meant what they said about the paper—but evidently it has not occurred to them **that it takes money as well as appreciation** to print 50,000 copies of THE MISSOURI FARMER twice each month.

If every **sincere** friend of THE MISSOUR FARMER would send us a dollar bill or check for a renewal of three years subscription—**and do it today!**—there isn't any sort of question but what we could give you a far greater and finer paper during the coming winter months than ever before—and hence this **personal appeal to you to help us make this realization possible!** Just as an extra inducement, we have concluded to make the following offer: To every reader of the paper who sends us a dollar for three years renewal between now and October 15th we will present free a handsomely printed Booklet containing the best "AFTER-THOUGHT STORIES" which have appeared in THE MISSOURI FARMER during the last four or five years. We, however, make this reservation—that should the interest in the "AFTER-THOUGHT STORIES" be so slight as to not warrant the cost of printing a quantity of the booklets, we reserve the right to refund your money. While THE MISSOURI FARMER is young and poor, it tries to be honest—and hence this reservation. If you can't spare the dollar now and want the "AFTER-THOUGHT STORIES," drop us a postal card and tell us when you will be able to send it so we can reserve a copy for you to be delivered later. We think the paper is easily worth the 33⅓ cents it will cost you at one dollar for three years—but if the hearts of any considerable number of our readers have been touched in the past by the sentiment expressed in "AFTER-THOUGHTS" we will be glad to send you a copy of them in neat booklet form. **Now please don't forget!** We need your dollar and we need it **now!**—and every penny of it will go to give you a better paper—a paper by Missourians for Missourians. If there are growing boys in your family these stories will make mighty wholesome reading for them when they grow up. Again, maybe you have a friend somewhere to whom you would like to send them— so if you want to take advantage of this offer please let us know **at once!** William Hirth, Publisher,

THE MISSOURI FARMER,
Columbia, Mo.

P. S.—The occasional policy of permitting banks to send the paper to their customers was discontinued over a year ago. There will therefore be no more free subscriptions.

Make This Great Store Your Headquarters When You Come to Saint Louis

We Occupy an Entire City Block

If you are coming to the Saint Louis Agricultural Fair—October 4th to 9th, inclusive—or if you visit the City on any other date, we most cordially invite you to make your shopping headquarters at our store, which for the past 65 years has been known for the excellence of its merchandise and its fair and square dealings.

Our establishment covers an **entire City block** and, with its more than 100 Specialty Shops, it is the most complete store West of the Mississippi River.

At the present time, our stocks of Fall Apparel for Men, Women and Children, Household Goods, etc., are complete and at their best, and if you will do your shopping at this store you are certain to secure the best goods for the price no matter what the price.

You are invited to make use of our many conveniences, which include a Ladies' Waiting Room, Men's Lounging and Smoking Room, Postoffice, Telephones, Telegraph Station, Indoor Golf Course, Bank, etc. Special attention is called to our Soda Fountains on the First Floor and in the Basement.

You will find—here—the world's most beautiful Piano and Victrola Shops, a complete Store for Men, a Floral Shop, Hair Dressing Shop, and America's greatest Shop devoted to Women's, Misses' and Children's Ready-to-Wear Apparel, as well as others too numerous to mention.

ESTABLISHED 1850

You Will Find Our Tea Room is a Delightful Place to Eat Your Luncheon. Excellent Food and Prompt Service.

Scruggs-Vandervoort-Barney

OLIVE and LOCUST from NINTH to TENTH

The best goods for the price no matter what the price

Railroad, Trolley or Steamboat fare will be refunded in accordance with the rules of the Associated Retailers of St. Louis.

BUCKSHOT BY THE PROFESSOR

"Teddy" and the "Elephant" are looking "soft and mushy" at each other again.

I hope we'll have some real nice, old-fashioned sunshine next Fourth of July—and a little rain.

The average "hound dog" is the best hog cholera "spreader" in the Universe. Therefore, "swat" the hound dog.

A lawsuit is a good deal like a prize fight—only not quite as fair because in a prize ring you are not allowed to hit below the belt.

I always like to have the stable and the pig pens far enough away from the open windows of the dining room so I can smell one thing at a time.

I don't know what's going to break loose next year—but I'll bet this summer's old chilled straw hat that it won't be chinch bugs or army worms.

Worry is a disease which has sent more men to premature graves than all the "germs" in Christendom—and the worst of it is that no doctor can cure it.

Some men are never satisfied. After they've kicked the dog around and licked the mules—then they turn around and try to "pick a fuss" with the women and children.

When some hog serum "peddler" comes around, see that he stays out of the hog lot—for the chances are there is more hog cholera on his boots than his "dope" could kill in six months.

It's mighty hard to ask Uncle Sam to "recognize" a bunch of whiskers like this Mexican fellow Carranzy—and before I did it I'd make him go and get a shave and a hair cut because I'd want to have some idea of what the animal I was "recognizin" really looked like.

If the mortgage has been paid off and if you have a good silo, a manure spreader, plenty of other necessary farming implements and a piano which can help to soothe you after the day's work and worry—why then, so far as I am concerned you can light in and buy an automobile.

Old "Josh" Simpson got tangled up with a keg of hard cider the other day and it took the town marshal and the whole bunch at the livery stable to get him and the keg "disentagled." It's powerful hard to keep old "Josh" from getting familiar with anything that's got any "kick" in it.

I saw where a couple of prize fighters divided up a pot of $35,000 the other day. That's a whole lot more money than United States senators get—but maybe a prize fighter is worth more than a statesman. Or maybe it's because a prize fighter really tries to do something and the average statesman doesn't.

Do you enjoy the "After-Thought Stories?" Well, if you will take advantage of the special offer made on page 8 you can get a beautiful booklet containing all the best "After-Thought Stories" which have appeared in The Missouri Farmer during the last four or five years free. It will make an inspiring book for the whole family to read. If there are any boys in your family why not get a copy of these beautiful stories for them to read when they grow up?

In the good old days a general could say, "Now, boys, get your corn knives and a bunch of rocks and let's mop up the enemy"—but in these days when a general commands a million men scattered over several hundred miles of front he has to send his subordinates a lot of "night telegrams" and tell them what he would like to have them do to the million "Huns" and "Savages" on the other side. Truly this modern war game is a "land office" proposition.

Every reader of THE MISSOURI FARMER should at once provide himself with the great new booklet entitled, "Stamping Out Hog Cholera" which is described elsewhere in this issue. If you will send in a dollar for three years renewal to THE MISSOURI FARMER they will send you a copy of this splendid booklet free of charge—but this offer will hold good for a short time only and there is therefore no time to lose. Not only is it the finest thing on Hog Cholera ever published but the two chapters on "Hog Breeding and Feeding" make it invaluable to every hog raiser.

Come to the St. Louis Fair

We want to extend a cordial and special invitation to every Missouri farmer and his "whole family" to attend the great **St. Louis Agricultural Fair** from October 4th to 9th—for it's going to be a great big jolly crowd and everybody, big, little, old and young are going to have the "time of their lives." There will be a magnificent Horse Show every day—participated in by some of the most famous blue ribbon winners in the Country. There will also be a great exhibit of Dairy Cattle, Swine and Sheep selected from some of the greatest "blue blood" herds in this section of the United States. Then there will be the greatest array of Farming Implements you have had a chance to see for a long time—and last but not least, a big "Tractor Demonstration" where you will have an opportunity to see all the leading 'Iron Horses" plowing ground and performing a lot of other "farm stunts" that will make your eyes open with wonder. In short, the business interests of St. Louis will fire the "opening gun" on October 4th of a great "Agricultural Fair" which is, in effect, a revival of the old St. Louis Fair which used to be famous all over the Country—and that, in a year or two, the new Fair will be the most popular enterprise of its kind in this section of the United States is a foregone conclusion. What our directors are striving after is a Fair **which the farmers will like!**—and hence we are going to give you a chance to see the things in which the average farmer is interested **and mix up a pile of fun and entertainment along with it!**

You and your family have worked hard all summer long and are entitled to a little recreation—for "all work and no play makes Jack a dull boy." So take two or three days off and bring the "whole bunch" with you. St. Louis is crowded with good hotels that charge a reasonable price for rooms—and you can eat where you please and pay as much or little as you like. During the day you can go to the Fair and in the evening, for a dime or a quarter you can see some of the finest picture shows and theatres in the Country. Then the show windows of the Big Stores look their best this time of the year—and they offer a world of real bargains. Last but not least, remember this gives you a chance to see the "Veiled Prophets Parade"—a sight worth going many miles to see within itself. Altogether, we promise you the most enjoyable "little vacation" you have had in years and we therefore hope you will come. Why not make up a party of neighbors and all stay at the same hotel? Surely a visit of two or three days to this great **Agricultural Fair** and the myriad interesting sights of a great city is a prospect which should appeal to every farmer family in Missouri.

The Plunderer

By ROY NORTON

Author of "The Garden of Fate"

(Continued from last issue)

She laughed again in her clear, mezzo voice, and then with a resumption of gravity gathered her reins into a firmer grip, and ,as her horse lifted his head in response to the summons, said: "Anyway, I thank you for volunteering to rescue me, Mr. Townsend, and wish you lots of good luck, but please don't start any more bowlders down the hill, because if you do I shall be robbed of my most enjoyable trip each day. Good-by."

"Don't be afraid," he called to her, as she started away. "There are no more bowlders to roll."

He stood and watched her as she rode, masterfully seated on the black horse, around a crag that stuck out into the trail.

"'Faith in anything is the first requisite for success,'" he repeated to himself, striving to recall whether or not it was, as she had intimated, a hackneyed proverb for the young; yet there was something bracing in it, coming from her calm, young, womanly lips. "That's it; she has it," he again said to himself. "'Faith.' That's what I need." And he resumed his tramp up the mountainside with a better courage and more hope for the Croix d'Or. He was still vaguely troubled when he made his way back past the power-house, in a sliding, scrambling descent, his boots starting tiny avalanches of shale and loose rock to go clattering down the mountainside.

The new men were proving competent under the direction of a boss pipeman who had been made foreman, and Dick trudged away toward the mine, feeling that one part of the work, at least, would be speedily accomplished.

Bill was still striding backward and forward, but devoting most of his attention to cleaning up the mill, and declared, with a wry smile, that he never felt better in his life, but never liked talking less.

When the noon whistle shrieked its high, staccato note from the engine-house, they went up to the mess, and seated themselves at the hend of the table. As a whole, the men were fairly satisfactory. Bill stared coldly down the table, and appeared to be mentally tabulating those who would draw but one pay-check, and that when their "time" was given them, but Dick's mind persisted in wandering afield to the chance encounter of the morning.

The men had finished their hasty meal, in hasty miner's fashion, silently, and tramped, with clumpy feet, out of the mess-house to the shade of its northern side before Bill had ended his painful repast. Whiffs of tobacco smoke and voices came through the open windows, where the miners lounged and rested on a long bench while waiting for the whistle.

"Don't you fool yourself about Bully Presby," one of them was saying. "It's true he's a hard man, and out for the dust every minute of his life, but he's got nerve, all right. He'll bulldoze and fight and growl and gouge, but he's there in other ways. I don't like him, and we quit pretty sudden, yet I saw him do somethin' once that beat me."

"Did you work on the Rattler?" another voice queried.

"No," the other went on, "I worked for him down on the Placer Belle in California. It was under the old system and was a small mine. Kept all the dynamite on the hundred-foot level in an old chamber. Every man went there to get it when it was time to load his holes. I was startin' for mine one evenin', whistlin' along, when I smelled smoke. Stopped and sniffed, and about weakened. Knowed it was comin' from the powder room down there. It wan't more'n twenty feet from the shaft, and there was two or three tons of it in that hole. Ran back and gave the alarm bell to the engineer, then ducked my head and went toward the smoke to see if anything could be done before she blew up the whole works. On his hands and knees, with all that was left of his coat, was Bully. He'd got the fire nearly smothered out, and we coughed and spit, and drowned the rest of the sparks from the water barrel. He'd fought it to a finish all alone, and I had to drag him out to the cage that was slidin' up and down as if the engineer was on a drunk, and every time it went up I could see the boys' faces, kind of white, and worried, and hear the alarms bangin' away like mad. But he'd put the fire out there with all that stuff around him. That took some nerve, I tell you!"

"What did he do for you?" asked another voice.

The narrator gave a heavy laugh, and chuckled.

"Do for me? When he got fresh air in him again, up in the hoist, he sat up and opened his hand. In it was a candlestick and a snipe, burned on the side till the wick looked about a foot long 'Who owns this candlestick?' says he. No one spoke, but some of us knowed it belonged to old Deacon Wells, an absent-minded old cuss, but the deacon had a family of nigh on to ten kids. So nobody answered. 'Some fool left this here,' Bully bellowed, tearing around. 'And that's what started the fire. I'll kick the man off the work that owns the stick.' Still nobody said anything. He caught me grinnin'. 'You know who it was,' says he. 'Sure I do,' says I, 'but I'm a little tongue-tied.' Then he told me he'd fire me if I didn't say who it was. 'Give me my time-check,' says I, and he gave it. He found out afterward I was the man that dragged him out, and sent a letter up to Colusa askin' me to come back, but I didn't go. Don't s'pose he'd remember me now, and don't know as I'd want him to. Any man that works for Bully comes about as near givin' away his heart's blood as any one could, and live."

The voices went rumbling on, and Dick sat thinking of the strange, powerful man of the Rattler.

"Three of the millmen know their business," mumbled Bill, as if all the time he had been mentally appraising his force. "Two are rumdums. The chips isn't bad. He could carpenter anywhere, and if he's as smart a timberman as he is millwright, will make good. The engineer that's to relieve Bells ain't so much, but I'll leave it to Bells to cuss him into line. That goes. Two of the Burley men are all right, and I fired the third in the first hour because he didn't know what was the nut and which the wrench. Smuts is a gem. He put the pigeon-blue temper on a bunch of drills as fast as any man could have done it."

Dick did not answer, but concentrated his mind on the work ahead. The whistle blew, and he compelled Bill to submit to new bandages, following the doctor's instructions, and smiled at his steady swearing as the wrappings were removed and the blisters redressed. They walked across to the hoist, entered the cage, and felt the sinking sensation as they were dropped, rather than lowered, to the six-hundred-foot level. The celerity of the descent almost robbed him of breath, but he thought of sturdy old Bells' boast, that he had "never run a cage into the sheaves, nor dropped it to the sump, in forty years of steam."

Lights glowed ahead of them, and they heard hammering. The suck of fresh air under pressure, vapored like steam, whirled around them in gusts, and the water oozed and rippled beside their feet as they went forward. The carpenter was putting in a new set of timbers, and his task was nearly finished, while beside him waited a drill man and a swamper with the cumbersome, spiderlike mechanism ready to set. The carpenter gave a few more blows to a key block, and methodically flung his hammer into his box and hurried back out through the tunnel toward the cage, intent on resuming his work at the mill.

Bill tentatively inspected the tim-

"STAMPING OUT HOG CHOLERA"

We have just finished printing a new booklet entitled "STAMPING OUT HOG CHOLERA" by Dr. J. W. Connaway of the Missouri Experiment Station and we believe it is easily the finest and best thing of the kind ever published in the Country. The booklet contains the recent splendid articles from Dr. Connaway which have appeared in THE MISSOURI FARMER—supplemented by a diagnosis of Cholera symptoms and a description of the results accomplished through the organization of neighborhood "Anti-Hog-Cholera Clubs." In other words, when a farmer has read this splendid booklet he knows what he should do in order **to prevent Cholera from getting a foot-hold on his premises** and also how he and his neighbors may join hands to stamp out this pestilence which is costing the farmers of Missouri six million dollars annually. Just how to proceed in the organization of an "Anti-Hog Cholera Club" is fully explained and we suggest that all our readers supply themselves with a copy of this great booklet **at once**—not only for their **individual protection** but also in other that they may help to lead in the organization of a movement which will permanently **wipe out this scourge in their communities!**

How to Make Hogs Pay

In addition to the powerful discussion of Hog Cholera by Dr. Connaway there are two splendid chapters on "Hog Breeding" and "Hog Feeding" by Prof. F. G. King of Purdue University, Indiana, and Prof. L. A. Weaver of the Missouri Experiment Station which make the booklet of **inestimable value to every farmer who raises hogs!** The money you can make out of your feeding operations depends very largely upon **what it costs you to get your hogs ready for market**—and these two well-known authorities tell you how, through balanced rations and the use of forage feeds you can enormously cheapen the cost of pork production. In short, this hand book on "Hog Cholera," "Hog Breeding" and "Hog Feeding" **should be in the hands of every thinking farmer in Missouri!** It contains 80 pages, is profusely illustrated, handsomely printed and bound and the retail price is 50c.

How You Can Get It Free!

For a limited time we will send a copy of "STAMPING OUT HOG CHOLERA" **free** to every reader of THE MISSOURI FARMER who sends us one dollar to renew his subscription for three years. When you see and read the book **you wouldn't take a dollar for it alone**—saying nothing about the three years renewal to the paper. If you don't come to this conclusion **we will refund your money!** Surely all our readers will want to take advantage of this great offer and we suggest you act promptly **before our supply is exhausted!**

THE MISSOURI FARMER, - - - Columbia, Mo.

bers, tapped the roof with a pick taken from the swamper's hands, heard the true ring of live rock, and backed away. The drill was drawn up to the green face of ore.

"About there, I should say," Dick directed, pointing an indicatory finger, and the drill runner nodded.

The swamper, who appeared to kow his business, came forward with the coupling which fed compressed air to the machine, the runner gave a last inspection of his drill, turned his chuck screw, setting it against the rocky face, and signaled for the air. With a clatter like the discharge of a rapid-fire gun, the steel bit into the rock, and the Cross was really a mine again. Spattered with mud and satisfied that the new drift was working in pay, the partners trudged back out.

They signaled for the cage, shot upward, and emerged to the yard near the blacksmith's tunnel in time to see a huge bay horse, with a woman rider come toiling up the slope. There was something familiar about the white hat, and as she neared them they recognized The Lily. Before they could assist her to dismount, she leaped from the saddle, landing lightly on her toes, and dropped the horse's reins over his head.

"Good-day—never mind—he'll stand," she said, all in a breath, striding toward them with an extended hand.

Dick accepted it with a firm grip, and lifted his hat, while Bill merely shook hands and tried to smile. It was to him that she turned solicitously.

"I'm glad you are out," she remarked, without lowering her eyes which swept over the bandages on his face. "You're all right, are you?"

"Sure. But how's that girl? It don't matter much about an old cuss like me. Girls are a heap scarcer."

The owner of the High Light looked troubled for a moment, and removed her gloves before answering.

"Doctor Mills says she will live," she said quietly, "but she is terribly burned. She will be so disfigured that she can never work in a dance hall any more. It's pretty rough luck."

Dick recoiled and felt a chill at this hard, cold statement. The girl could never work in a dance hall any more! And this was accepted as a calamity! Accustomed as he was to the frontier, this matter-of-fact acceptance of a dance-hall occupation as something desirable impressed him with its cynicism. Not that he doubted the virtue of many of those forlorn ones who gayly tripped their feet over rough boards, and drank tea or ginger ale and filled their packets with bar checks to make a living as best they might, but because the whole garish, rough, drink-laden, curse-begrimed atmosphere of a camp dance hall revolted him.

Mrs. Meredith had intuition, and read men as she read books, understandingly. She arose to the defense of her sex.

"Well," she said, facing him, as if he had voiced his sentiment, "what would you have? Women are what men make them, no better, no worse."

"I have made no criticism," he retorted.

"No, but you thought one," she asserted. "But, pshaw! I didn't come here to argue. I came up to tell you that the dance-hall girl will recover and has friends who will see that she doesn't starve, even if she no longer works in my place. Also, I came to see how Mister—what is your name, anyway?—is."

"Mathews, ma'am. William Mathews. My friends call me Bill. I don't allow the others to call me anything."

The temporary and threatening cloud was dissipated by the miner's rumbling laugh, and they sauntered across the yard, the bay horse looking after them, but standing as firmly as if the loosened reins were tied to a post instead of resting on the ground. A swamper, carrying a bundle of drills, trudged across the yard to the blacksmith shop, as they stood in its doorway.

"I sent you the best men I could pick up," The Lily said. "You did me a good turn, and I did my best to pay it back. That blacksmith is all right. Some of the others I know, but I don't know him. Never saw him before. You'd better watch him."

She pointed at the swamper as cooly as if he were an inanimate object, and he glared at her in return, then dropped his eyes.

"I told you I didn't run an employment agency," she went on, "but if any of these fellows get fresh, let me know, and I'll try to get you others How does the Cross look, anyway?"

They turned away and accompanied her over the plant above ground, and heard her greet man after man on a level of comradeship, as if she were but a man among men. Her hard self-possession and competence impressed the younger man as a peculiar study. It seemed to him, as he walked beside her thoughtfully, that every womanly trait had been ground from her in the stern mills of circumstance. He had a vague desire to probe into her mind and learn whether or not there still dwelt within it the softness of her sex, but he dared not venture. He stood beside the bandaged veteran as she rode away, a graceful, independent figure.

"Is she all tiger, or part woman?" he said, turning to Mathews, whose eyes had a singularly thoughtful look.

The latter turned to him with a quick gesture, and threw up his unbandaged hand.

"My boy," he said, "she's not a half of anything. She's all tiger, or all woman! God only knows!"

CHAPTER VII

THE WOMAN UNAFRAID

They were to have another opportunity to puzzle over the character of The Lily before a week passed, when, wishing to make out a new bill of supplies, they went down to the camp. The night was fragrant with the spring of the mountains, summer elsewhere—down in the levels where other occupations than mining held rule. The camp had the same dead level of squalor in appearance, the same twisting, wriggling, reckless life in its streets.

"Fine new lot of stuff in," the trader said, pushing his goods in a brisk way. "Never been a finer lot of stuff brought into any camp than I've got here now. Canned tomatoes, canned corn, canned beans, canned meat, canned tripe, canned salmon. That's a pretty big layout, eh? And I reckon there never was no better dried prunes and dried apricots ever thrown across a mule's back than I got. Why, they taste as if you was eatin' 'em right off the bushes! And Mexican beans! Hey, look at these! Talk about beans and sowbelly, how would these do?"

He plunged his grimy hand into a sack, and lifted a handful of beans aloft to let them sift through his fingers, clattering, on those below. The partners agreed that he had everything in the world that one could crave in the way of delicacies, and gave him their orders; then, that hour's task completed, sauntered out into the street.

Dick started toward the trail leading homeward, but Bill checked him, with a slow: "Hold on a minute."

The younger man turned back, and waited for him to speak.

"I'd kind of like to go down to the High Light for a while," the big man said awkwardly. "We ought to go round there and see Mrs. Meredith and patronize her as far as a few soda pops, and such go, hadn't we? Seein' as how she's been right good to us."

Dick, nothing loath to a visit to The Lily, assented, although the High Light, with its camp garishness, was an old and familiar sight to any one who had passed seven years in outlying mining regions.

The proprietress was not in sight when they entered, but the bartenders greeted them in a more friendly way and the Chinese, who seemed forever cleaning glasses, grinned them a welcome. They nodded to those they recognized, and walked back to the little railing.

"Lookin' for Lily?" the man with the bangs asked, trying to show his friendliness. She ain't here now, but she'll be here soon. She's about due. Go on up and grab a box for yourselves. The house owes you fellers a drink, it seems to me. Can I send you up a bottle of Pumbry? The fizzy stuff's none too good for you, I guess."

He appeared disappointed when Dick told him to send up two lemonades, and turned back to lean across the bar and hail some new arrival. The partners went up and seated themselves in one of the cardboard stalls dignified by the name of boxes, and, leaning over the railing in front between the gilt-embroidered, red-denim curtains, looked down on the dancers. Two or three of their own men were there, grimly waltzing with girls who tried to appear cheerful and joyous.

Shrill laughter echoed now and then, and when the music changed a man with a voice like a megaphone shouted: "Gents! Git pardners for the square sets!" and the scene shifted into one of more regular pattern, where different individuals were more conspicuous. Some of the more hilarious cavorted, and tried clumsy shuffles on the corners when the raucous-voiced man howled: "Bala-a-ance all!" and others merely jigged up and down with stiff jerks and muscle-bound limbs, gravely, and with a desperate, earnest endeavor to enjoy themselves.

A glowering, pockmarked man, evidently seeking some one with no good intent, pulled open the curtains at the back of the box, and stared at them in half-drunken gravity; then discovering his mistake, with a clumsy "Beg pardon, gents," let the draperies drop, and passed on down the row.

Across from them, in the opposite box, some man from the placers, with his face tanned to a copper color, was hilariously surrounding himself with all the girls he could induce to become his guests, holding a box party of his own. He was leaning over the rail and bellowing so loudly that his voice could be heard above the din: "Hey, down there! You, Tim! Bring me up a bottle of the bubbly water—two bottles—five—no, send up a case. Whoop-ee! Pay on seventeen! This is where little Hank Jones celebrates! Come on up, girls. Here's where no men is wanted. It's me all by my little lonely!"

Some one threw a garland of paper flowers round his neck, which he esteemed as a high honor, and shook it out over the floor below, where all the dancers were becoming confused in an endeavor simultaneously to watch his antics, and keep their places in the dance.

"The most disgusting object in the world is a man who drinks!" came a cold voice behind them, and they turned to see The Lily standing back of them, and frowning at the scene across.

Bill turned to greet her, holding out his hand, and his broad shoulders shut out the view of Bacchanalia.

"The bartender says you drink nothing stronger than lemonade," she said, looking up at the giant, "and I am glad to hear it. It is a pleasure to meet men like you once in a while. It keeps one from losing faith in all."

She sat down in one of the chairs—a trifle wearily, Dick thought, and he noticed that there were lines under the eyebrows, melancholy, pensive, that he had not observed before in the few times they had met her. As on the occasion of their meeting at the mine, she appeared to sense his thoughts, and turned toward him as if to defend herself.

"You are asking yourself and me the question, why, if I dislike liquor, and gambling, and all this, I am owner of the High Light?" she said, reverting to her old-time hardness. "Well, it's because I want money. Does that answer you?"

"I didn't ask you a question," he retorted.

"No, but it's just like it always is with you! You looked one. I'm not sure that I like you; you look so devilsh clean-minded. You always accuse me, without saying anything so that I can have a chance to answer back. It isn't fair. I don't like to be made uncomfortable. I am what I am, and can't help it."

She turned her frowning eyes on Bill, and they softened. She relented, and for the first time in the evening her rare laugh sounded softly from between her white even teeth.

"You see," she said, addressing him, "I can't help being angry with Mr. Townsend. I think I'm a little afraid of him. I'm a coward in some ways. You're different. You just smile kindly at me, as if you were older than Methuselah, and had all the wisdom of Solomon or Socrates, and were inclined to be talerant when you couldn't agree."

"Go on," Bill said. "You're doin' all the talkin'."

"I have a right to exercise at least one womanly prerogative, once in a while," she laughed. And then: "But I am talking more than usual. Tell me about the mine and the men? How goes it?"

This is a good time to organize a farm improvement club. Write us if you are interested.

What Shall I Pay for a Piano?

First make up your mind to buy a good piano. This does not necessarily mean the highest priced piano, but, naturally, a good piano cannot be made to sell at the price of a poor one. However, it is possible to buy a high grade piano at a reasonable price.

Prove this yourself—investigate the

Crown Piano

Scientific factory organization and large volume of business enable us to produce a high grade, artistic instrument at a price only slightly higher than pianos of medium quality manufactured under less favorable conditions.

How Can I Know A Good Piano?

Send for the complete set of our books. They tell you just how to test pianos—how to recognize true musical value; what to look for. These are points you ought to know and you are welcome to them whether you decide upon a Crown or not. Follow the advice in these books and you will get a good piano.

ROPY OR SLIMY BREAD

"During the last few weeks we have had trouble with our bread. It gets so sticky that when a knife is run through it the knife comes out sticky and white. The bread also smells badly. We have been cooking four loaves, medium size and the first two will be all right but the third will begin to get sticky and off in flavor."—V. M.

In answer to the above statement of troubles one of our readers has been having with bread making the following reply is made by Addie D. Root of the Agricultural Extension Service, College of Agriculture, University of Missouri:

Ropy or slimy bread may become a great trial to the housewife and preventative measures should be taken at the first appearance of the difficulty. The condition is caused by the action of a certain group of bacteria known as potato bacillus. The organisms are given different names but may be the same organism grown under different conditions in different parts of the country. They are a spore producing bacteria and are difficult to kill on account of being able to resist an intense heat. They are able to withstand a boiling temperature, for three or four hours. The best temperature for their growth varies with different organisms, being between 95° and 107° Farenheit, but they grow best in bread at about 77° Farenheit. They are not ordinarily killed in baking because the inside of the loaf does not get hot enough. This is especially true when the bread is not baked in single pans. These organisms also grow best in a soft dough or one which is not too stiff and in a dough which is quite moist.

The effect of these organisms upon bread is very noticeable. The bread becomes sticky and has a very disagreeable odor. The starch content of the bread is decreased from about 62 to 59 per cent. The starch is broken down into sugar and thus the sweet sticky substance. The protein is decomposed into alcohols, aldehydes and esters and this combination gives off odors. Thus the action of these organisms upon the bread completely spoils it as a palatable food. The source of these bacteria in bread is difficult to discover. They are common in the soil, therefore they may come from dust from the hands of the worker. They may be carried by flies. They might come from using dry yeast cakes that have stood for some time on dusty shelves or from dusty flour.

Sanitary surroundings are the best preventative. Tables, floors, boards, dishes and hands must all be kept very clean and sterile. This condition may be obtained by the use of scalding water. Washing everything with borasic acid, all that will dissolve in water; also wiping up with vinegar is good to get rid of the infection. The growth of the bacteria in the bread may be prevented by making the bread using whey for the liquid or by the addition of a little less than 1½ tablespoon of vinegar to one quart of flour. It may be added to the sponse in mixing, making no appreciable difference in the bread. Keeping the bread after baking below 68° Farenheit will aid in preventing their growth.

Fried Apples

Core and cut in circles, either with a knife or an apple-parer, put into a pan with a little water and allow to cook on the top of the stove until tender, add sugar and butter, but do not stir; put in the oven until browned and serve hot.

Canned Apples

Peel, core and cut apples into halves then cook in sufficient water to cover the fruit; when they begin to get tender sprinkle with sugar to taste and price; after the sugar has entirely dissolved fill the cans carefully, so that the shape of apples is retained. They are equal to canned pears or peaches.

If glass jars are used the fruit could be placed in the jars before cooking. pour over them a heavy boiled syrup hot, place the filled jars in steamer or wash boiler with cold water and allowed to remain over the fire until the low to remain over the fire until the and seal tightly. Mrs. S. W. Ravenel,
Rivercene Farm.

Let us hear from more of our Missouri Apple Consumer's League with their favorite way of serving this queen of fruits.

You who love flowers, and you must grow them to really love them, can appreciate the rest that comes in caring for their wants.

Just what name to give this subtle power is a problem, but since color plays so important a part in the beauty and harmony of nature's scheme, cannot it be that our sleeping souls respond more fully to the brightness and cheer of their color rather than their form or perfume?

Try planting a few bulbs this fall in some nearby spot where you can see them as you move about in your daily duties.

One of the most successful home conservatories can be built just out from the kitchen, it may be only a few feet, but the steam from the kitchen stove helps to keep the atmosphere moist, thus increasing the growth and blooms.

EFFICIENCY IN THE HOME

Efficiency—the ability to get things done—woman's liberation from drudgery lies not so much in tools as in her own improved methods of work.

The end and aim of home efficiency is not a perfect system of work or a scientific scheduling or ideal cleanliness and order, it is the general happiness, health and progress of the family in the home.

Its very purpose is more liberty, more leisure, a shrewder sense of values and the elimination of wasted energy.

So long as the whole question of disbursement lies in the average household on the shoulders of women, the sooner they can shoulder the burden intelligently the more time and strength they will be able to give to all the other movements which so increasingly interest them.

Remember your daughter is a human being with a fienite line of work in life and you owe it to her first of all to give her the best practical and theoretical training for her future life-work.

Every woman is inherently a homemaker and the best thing you can do for her happiness is to train her in this work of homemaking, which is not a simple kind of knowledge which can be left to choice, but a serious, many-sided study, brimful of opportunity to apply the highest kind of knowledge.

You should wish your daughter to know more than you know. Old-time methods and ideas are changing and the school will teach your daughter new methods and new housekeeping which means less drudgery and effort than you have put into your work all your life.

Great national issues and political battles of every description may rise and fall, but the duty and privilege of maintaining the structure of the family upon which foundation all modern civilization is based and which remain today where it has always been, in the hands of women.

The greatest woman in the world is the wife of a farmer who does her own cooking, washing, ironing, sewing, brings up a family of boys and girls to be useful members of society, and still finds time for intellectual improvement. Mrs. M. D. Norton,
Rt 4, Sedalia, Mo.

Going to Buy a Piano?

If you are thinking of buying a Piano, write to the Geo. P. Bent Co., 214 S. Wabash Ave., Chicago, and ask them to send you their literature about the Crown Piano. You will find the advertisement elsewhere in this issue.

Best heat for farm home

Put June warmth in every room

A farm mother deserves and ought to have all the comforts and conveniences that the city mother enjoys. First of all she needs a warm, evenly-heated house free from drafts, chill and dampness. She must also be freed from the back-breaking drudgery of "tending stoves." Old fashioned heating methods wear women out, and even then only heat the house in "spots," spout dust, gases and dirt, and use up far more fuel than necessary. With radiator heating every nook and corner of the whole house is made cozy. The strongest wind or fiercest blizzard cannot stop the steady flow of comfortable heat all over the house from

AMERICAN RADIATORS & IDEAL BOILERS

These splendid heating outfits are no longer considered "luxuries for the rich." The smallest farm cottage or largest farm house can be equipped at very reasonable cost. At present low iron market the cost will surprise you. In thousands of farm houses IDEAL-AMERICAN Radiator heating is saving fuel every year and giving the families a world of comfort and health. These outfits heat the whole house with one fire and require no more care-taking than to run a stove for one room. Best of all, they last forever and a repair bill is almost unknown. They increase the value of your property to more than their cost.

IDEAL Boilers and AMERICAN Radiators bring no dust, ashes or coal-gas into the rooms. Wild blizzards only make them more active in keeping the cold out of the house. They are noiseless, absolutely safe (a child can run them), and can at any time be put in new or old houses with ease without disturbing anything or tearing out walls or partitions. They protect the farm house against fire risk and run independently of the water works supply or water mains, as same water is used over and over again for years.

The IDEAL Boiler may be put in cellar or side room and will burn any local fuel—wood, oil, gas, lignite, hard or soft coal, (even cheap grades of pea coal, slack, run of mine, screenings, etc.) If warm cellar interferes with storing vegetables, boiler and pipes may be covered and *all* heat then goes to upper floors.

Bankers and real estate men will back our statement that it is a paying and permanent investment and not an expense.

A No. 1021 IDEAL Boiler and 262 sq. ft. of 38 in. AMERICAN Radiators, costing the owner $185, were used to heat this cottage, at which price the goods can be bought of any reputable, competent Fitter. This did not include cost of labor, pipe, valves, freight, etc., which vary according to climatic and other conditions.

Let us tell you all about it and give you special information so you can judge for yourself. *Write today—now—for free booklet* "Ideal Heating." You will not be asked to promise or obligate yourself in anyway, but send for this book at once.

IDEAL Boilers have large fuel pots in which the air and coal gases thoroughly mix as in a modern gas or oil mantle or burner, thus extracting every bit of the heat from the fuel. Easier to run than a stove and no parts to wear or rust.

Sold by all dealers. No exclusive agents.

AMERICAN RADIATOR COMPANY

Worth Every Farmer's Thought

Elsewhere in this issue will be found an advertisement of the American Radiator Co., and while it is not our custom to urge readers to buy this or that thing unless they desire to do so of their own volition—yet the heating of farm homes is an important problem which vitally affects modern farm life and we suggest that those of our readers who are interested drop a line to this high-class concern and ask for a copy of "Ideal Heating"—a booklet which will be mailed free of charge and which contains, to say the least, a lot of very valuable information.

The old-time heating stove is a nuisance which should be tolerated not a day longer than the farmer can help. To begin with, it requires unremitting attention—and unless it receives it, it persists in "going out." One moment it is blazing hot while the next it is cold—thus subjecting the inmates of the household to a rapidly changing temperature which is responsible for much sickness. What manner of farmer is it who doesn't hate to get up in the early morning to "build the fire"—and who but can recall the cold waves and blizzrads of other days when, despite the old stove, everybody shivered with cold while everything in the kitchen and pantry froze as hard as a rock? Added to all this is the fact that it is a constant menace of fire—and thus, if for two or three hundred dollars you can solve this situation for years to come—if you can provide every room in your home with an even, healthful temperature—if you can do away with the drudgery, danger of fire and save money on fuel bills besides—then surely it is a matter worth looking into carefully and if you act promptly you will have plenty of time to install one of these modern heating plants before winter sets in.

Anybody who says that the life of the farmer is all sunshine and really believes it would get the best of it if he swapped brains with the average mule. It is only when we compare farm life with the smut and grime of a city that it stands out to advantage but even at that it is by no means a bed of roses and the chump who says so is a chattering ignoramus.

Last Call for Cook's Poland China Sale

This is to remind our readers that on Thursday, October 7, Ed. W. Cook will hold a sale of very high class Poland Chinas, at his farm adjoining Pattonsburg, Mo. This sale will offer a rare opportunity for the purchase of breeding stock of the very highest order. For several years past Mr. Cook has been carefully putting a herd together that would stand without a superior and in order that every foundation animal would stand the "acid test" he selected only such individuals as were conceded by competent judges to be among the best. It is perhaps true that no herd in Missouri contains as many really good sows as will be found in the Cook pastures. They are not only good individuals but they are good producers and are backed up with pedigrees that show nothing but big type blood.

Mr. Cook had planned to hold two sales —one in October and one in February, but about two weeks ago he reached a decision not to hold a February sale and consequently he is putting into this offering about fifteen head of tried sows and yearling gilts that otherwise would have gone over until the second sale.

Space forbids a detailed mention of all the good things to be cataloged, but we will mention a few to give an idea as to the quality of the offering. Belle Jumbo, by Big Jumbo II sells with a litter by King Joe. Belle Jumbo is a sow that will look good in any herd in the country. She is an extremely large sow, a real 800-pound sow we should say, and is good in every way—just the type of brood sow every breeder wants. Now here is a point to keep in mind, Belle Jumbo, and several other sows will sell with litters and this fact will prevent them from being offered in high condition, indeed, some of them will be thin and the chances are that they will not bring as much as they would otherwise. Don't let that fact keep you from buying them. Jumbo Wonder 2nd, by A. Wonder out of a Jumbo dam, is a litter sister to the sow U. S. Bynu paid $400 for—she sells with a litter by Bob The Wonder.

Big Lady Jumbo is one of the sensational litter that sold in Walter's sale for $1530. She is by Long Jumbo and out of Big Lady Wonder. These are just a few of the good things in store for those who attend the sale. Among the yearlings are several that give every promise of developing into A No. 1 brood sows. The same can be said of the nineteen early spring gilts—they are poppers for size and quality.

Among the fall boars—all of which are by King Joe—are several very attractive herd boars that should go to good herds. The spring boars were just as good—only a little younger.

Most of the offering represents the get of the great young boar King Joe, by King of Wonders. King Joe is one of the most talked of Poland China boars in the state and his ability as a sire will be demonstrated very forcibly sale day when his get is seen. Some of the younger stuff is by Bob the Wonder a good son of the great sire, Big Bob.

Send for catalog and arrange to be at this good sale. R. P. Royce will be glad to handle any bids for our readers who are unable to attend. In writing please mention this paper.

King Joe, by King of Wonders, the 1000-pound two-year-old boar in Ed. W. Cook's herd. At 20 months old he weighed 825 pounds

Dickerson Sells Spotted Polands, October 6th.

Our readers are reminded that on Wednesday, October 6th, H. T. Dickerson will offer at public sale at Jameson, Mo., 60 head of old-fashioned spotted Poland Chinas. The sale will include ten extra good summer and fall yearling gilts, 25 spring boars and 25 spring gilts.

Mr. Dickerson is one of the young progressive breeders of this state, and the offering he is preparing for sale would do credit to any herd. Everything cataloged is bred in the most popular spotted bloodlines and a review of the pedigrees shown in the catalog discloses many of the noted boars. Among the yearling gilts, most of which are sired by Spotted Mike, by the great breeding boar Lamar Chief, are several that are particularly good and are the kind that will fit into any herd.

The spring pigs are of early farrow and from the first have been handled in a very intelligent manner and consequently they will have plenty of size and at the same time will be sold in just the right condition to do the buyer some good.

Most of the spring stuff is sired by Mr. Dickerson's two good herd boars, Spotted Chief 65306 by old Pawnee Pete, and Spotted King 66978 by Longfellow, a son of Hoppe's Big Chief. There are other litters by Lucky Judge and Good Enough —the well known Faulkner boars, and by Cainsville Boy, one of the best boars in the Corn Belt.

Mr. Dickerson's herd sows are of strictly spotted breeding and represent such famous boars as Budweiser, Clipper, Lamar Chief, etc.

Our representative has seen this offering and takes pleasure in recommending this sale to those of our readers who are interested. Mr. Dickerson will be glad to mail his catalog to any one who writes for it. Please mention this paper.

Gurthet Will Sell Polands October 29

On Friday, October 29th, J. B. Gurthet, Pattonsburg, Mo., will hold his second annual sale of strictly big type Poland Chinas. Mr. Gurthet will offer 55 head, consisting of 8 tried sows, 15 fall gilts, 18 spring gilts, 9 spring boars, and 3 fall boars. This is one of the good herds of North Missouri and the offering this year is such that breeders and farmers will be interested in.

Mr. Gurthet has gone pretty deep into his herd in getting material to make this sale an attractive event and many of the sows cataloged would be hard to buy privately. Among the tried sows to be sold are daughters of A. Wonder, Colossal, Major Blain, Excellent Wonder, and other noted breeding boars. Most of the yearling boars and gilts are by Long King's Equal II, by Long King's Equal, and out of an A. Wonder dam. The spring stuff is largely the get of Orange Wonder 74005 by Big Orange, and out of an A. Wonder dam.

The offering is very desirable in every way and we take please in urging our readers to attend. We have been familiar with Mr. Gurthet's herd for the past three years and know that the herd today is better in every way than it was three years ago. Write now for the catalog and watch this paper for further announcement and more details concerning the offering.

Acid Stomach Claims Millions Of Hogs!

An enormous percentage of all hog losses is due to stomach disturbances and stomach disturbances are largely due to acidity, which interferes with the digestive juices and thereby impairs digestion. Result—thin, scrawny hogs that seem half-starved no matter how much they eat. Millions die. Thousands of hog raisers have proved that the safe and reliable way of neutralizing this acid and preventing its forming again is to mix just a little

MERRY WAR LYE

in swill, or with the drinking water, if the hogs are on dry rations. It not only neutralizes the acid but also sweetens the swill, thereby preventing the fermentation that causes the acidity. Moreover, it adds weight to hogs because it helps thorough digestion, leaving no waste food. Hogs come right up, under this simple treatment which produces amazing results.

There's as much difference in Lyes as there is in Doctors, so don't count any trial made with any other than Merry War Powdered Lye. The experience of thousands of hog raisers has proved the value of Merry War Lye. Its use is *not* an experiment.

Send for free booklet filled with letters from hog raisers. They will convince you. But a better way to be convinced is to give it a trial on your own hogs. The cost is practically nothing. It is absolutely safe to feed to hogs according to plain, easy-to-follow directions on label.

Keeps Poultry Healthy Merry War Powdered Lye mixed with feed or water according to directions on label, helps to make poultry sturdy and better able to resist White Diarrhoea, Diarrhoea from Indigestion, Cholera, Roup, Limberneck, Gapes, Worms, etc.

"There Are No Substitutes"

Last Call for the Austin Angus Dispersion Sale

This is the last opportunity we will have to call attention to the J. W. Austin Angus dispersion sale to be held at the Fair Grounds near Carrollton, Mo., Tuesday, October 5th. This sale is an absolute dispersion of this old established herd and will afford an excellent opportunity for breeders and farmers to secure breeding cattle of exceptional merit.

The herd is being dispersd for the reason that Mr. Austin's eyesight has failed and he finds it no longer practical to give his attention to the business.

There are 115 head listed for sale and represent five of the most popular and useful families of the breed—Blackbirds, Prides of Aberdeen, Queen Mothers, Drumin Lucys, and Nosegays.

The herd has always been handled for profit along conservative and progressive lines. Bulls of the most approved type and bloodlines have always stood at the head of the herd and the present herd bull, Blackbird Monarch A., a grandson of the mighty Prince Ito, will make some breeder a good buy.

Twenty-seven younger bulls, ranging in age from 8 to 20 months are catalogued and in the lot are several very nice, thick-fleshed herd bull prospects. The 87 cows and heifers are the kind that Missouri farmers must come to if they are to make the most of their farming and feeding operations. Every one of the cows is a regular breeder and none of them are old cows whose future usefulness is open to question. Several of the cows will have calves at foot and everything of breeding age sells bred to Blackbird Monarch A.

There will be no Angus sale at the Royal this year and as this sale occurs on the second day of the show those of our readers who had planned to buy at the association sale will find it convenient to run down to Carrollton.

Write at once for the catalog and kindly mention this paper.

Report of J. F. Richards & Son's Sale

As announced last issue the sale of Poland China bred sows, gilts and boars, held by J. F. Richards & Son, at their Pen-Yr-Hyl Farm, near Bevier, Mo., on Wednesday, September 8th, was almost a flat failure from Messrs. Richards' standpoint.

The offering was a high class one in every way, and ordinarily was worth an average of $50 or $60. Perhaps, the fact that it occurred at a time when most every one was busy mitigated against its success to a certain extent, but no one was prepared for a slaughter. Just before noon a very threatening cloud came up and in a few minutes rain was pouring in torrents, naturally, the local buyers were kept away and when Col. H. S. Duncan opened the sale there were few on hand to buy. Another factor that kept the average down was the loss of Pawnee Price, the senior herd boar that had done so much to put the Richards' herd to the front. Just two days before the sale Pawnee Price got with another boar and as usually happens the good one was killed. Had the buyers seen what a great individual he was they would have shown keener appreciation for sows bred to him.

Bidding was very indifferent and the best that could be done was an average of about $33 on the bred stuff. The average on the entire lot was $29—at least $25 under the real worth. Messrs. Richards proved themselves game to the core and refused to stop the sale as long as there was any bidding, even after it was apparent that the crowd had about all the hogs it wanted. Col. Thos. E. Deem assisted Col. Duncan. Following is a list of buyers who paid over $25:

No. 2.	Bridges Bros., Slater, Mo.	$60.00
No. 4.	R. F. Baldwin, Rocheporte	37.50
No. 5.	E. T. Davis, St. Joseph	25.00

ED. W. COOK - - - - - - - - - PATTONSBURG, MO.

of the city of Chicago. St. Louis packers and butchers are therefore planning a royal entertainment for the visitors.

The association represents an industry with an aggregate capital investment of one and one-half billion dollars. Including all phases of production and manufacture it is the largest single industry in the country. A feature of the association is the increased interest manifested in it each year by the smaller packers and butchers scattered throughout the United States.

St. Louis is planning to entertain 1500 delegates and visitors to the convention. The official program for the meeting will be announced shortly. A subject that will receive careful consideration by the association, is that of arousing more interest in beef cattle production throughout the United States, an industry that for various reasons has not kept pace with the increase in population the past decade.

Riggs Sells Poland Chinas October 7

One of the most attractive Poland China offerings to be sold this fall is the one scheduled to sell Thursday, October 7. The offering is from the Crystal Springs herd owned by N. R. Riggs, Lawson, Mo.

The sixty head of boars and gilts to be sold are all of February and March farrow. Most of them are by Jumbo Orr 178083, the great breeding son of Missouri Lad. Jumbo Orr is counted among the best boars of the state and he has gained this reputation through the sheer merit of his pigs. I have seen a bunch of good stuff this summer but I have yet to see a more uniform lot of pigs than Mr. Riggs is preparing for sale. Several other boars of strictly big type breeding are represented in the offering and buyers will have a chance to select boars and gilts sired by Iowa King, Big Superior's Equal, Long, Superior, and Hale's Missouri Lad. The dams of these pigs are excellent big, heavy boned, motherly sows, of exceptional prolificacy.

No breeder that I am familiar with has given the subject of feeding more careful study than Mr. Riggs and by sale day he will drive out a bunch averaging around 220 pounds in good thrifty growing condition.

Send for the catalog and kindly mention this paper.

Andrews' Annual Spotted Poland Sale

Remember that on Thursday, October 14, the Andrews' Stock Farm will hold their annual sale of old-fashioned spotted Poland Chinas, at Lawson, Mo.

These sales are so well known to our readers that little more need be said, but for the benefit of those who are not familiar with these events we will say, that the Andrews Stock Farm maintains one of the best herds of spotted Poland Chinas owned in Missouri and that each year the top selections from the spring farrow are offered at public sale. This year Mr. Andrews is putting in 14 summer and fall yearling gilts and as very special attractions he has catalogued two tried daughters of the famous Budweiser, besides these, there will be offered 20 spring gilts and spring boars.

We have been in close touch with this herd for the past several years and are familiar with the class of hogs that are being produced, and furthermore, we have watched this blood in other herds, and know that it makes good.

The offering this year is quite up to the standard of the past and we do not hesitate to recommend that our readers attend.

The two tried sows, Budweiser Lady and Budweiser Girl are among the best producing sows in the herd and are being sold only because so many of Mr. Andrews customers have been daring him to give them a chance to buy some of his older stuff. One of the sows, Budweiser Girl, sells bred to Spotted Clover, the other sells open. The summer and fall gilts that are listed are among the best that Mr. Andrews has raised, they are all sired by Spotted King and Spotted Jumbo, the two herd boars that have contributed so much to the success of this herd. Several of them are real outstanding brood sow prospects of high order. The spring boars and gilts are, for the most part, a bit younger than Mr. Andrews usually puts in, but at that, they are mostly of March and April farrow and for their age, possess plenty of size, and we believe a trifle more bone than the spring stuff showed last year.

A point of more than passing interest is the fact that Spotted Jumbo, one of the best boars in the state, died this spring and this is the last chance to get his blood.

Write at once for the catalog and plan to be there when the sale starts.

The kind of Spotted Polands produced by the Andrews Stock Farm

Watson Offers Real Duroc Bargains

W. C. Watson, New London, Mo., is offering the readers of this paper some genuine bargains in Duroc spring boars.

Mr. Watson is one of the progressive breeders of Northeast Missouri who is doing much to put this state in the front rank as a Duroc center.

The boars he is offering are sired by Crimson Chief Again, an excellent Crimson Wonder bred boar that Mr. Watson purchased in partnership with Kennet Keithley of New London, from Henry Russell of Iowa. Two exceptionally good prospective herd boars are the two out of the great sow Tattletale 39th, and sired by the great boar Illustrator. Buy one of these boars and you will have as good blood as the breed affords.

Angus Bulls and Heifers for Sale

Look up the advertisement of K. H. Brown Bolivar, Mo., in which he offers a number of useful young Angus Bulls and Heifers for sale at prices that the average farmer can afford to pay. Mr. Brown is thoroughly reliable to deal with. Mention this paper when you write for prices.

NEED BETTER PUBLIC SENTIMENT FOR GOOD ROADS

The Missouri Farmer:

I have my own little notions about the road question and they may be hot air notions too, but if several others agree with me and we all will have our say it may do some good after all. Is it not the law that any laid out road in Missouri shall be 40 feet wide? Also when a road has been laid out for a number of years and a grade established does the land owner along the road have a right to set his fence out in the road? I do not think one-half the roads in our county are wide enough to make a grade and have dirt enough to hold it. But what am I to do? If I make complaint about our neighbor's fence being in the road then we have a lawsuit on our hands right away. There is a case of that kind now in our neighborhood. When you take a foot or two of worn-out soil, or weed infested soil from one of these moss-backs it makes him sick like a boy who has eaten green apples—he wants to throw up.

Too many men want good roads at the expense of some one else. When the overseer or some neighbor calls him out and asks him to donate a little work to grade down a hill or put in a culvert along his own road, he is "just so awful busy" he can't take time to help." We need a law to widen our roads and a direct tax levy high enough to give enough money to build some good roads.

A. Farmer, Brashear.

The statutes of this state provide that public roads shall be not less than thirty nor more than sixty feet wide. A penalty is provided for obstructing a road by setting the fence out or by throwing brush into the road, or other obstructions, but the court would have to determine from the records as to the proper width of the road and then from evidence as to whether there was obstruction. What we need to get roads of proper width, and to get sufficient funds is not so much more law as it is better public sentiment. We have laws now for widening roads and for raising money to build roads but these laws can be enforced only in communities where the majority of the people are united and working together. The more nearly unanimous this sentiment is the easier it will be and the less troublesome the opposition. Sometimes one "moss-back," "skin-flint," "tight-wad" farmer who owns a lot of land can cause a lot of trouble but in most cases where public sentiment is very strong for a public improvement these "tight-wads" gradually get ashamed of themselves and give away to the progressive plans of the community.

Sometimes it is necessary to handle these cases by force of law but as a rule it is better to use diplomacy, persuasion, and a good example. If you can not do better let every man who favors good roads see that his fence is back the right distance, that the weeds are cut along his own farm, that the road is dragged and the ditches cleaned and the force of good example may make a road enthusiast out of Mr. Mossback. If it does not you will have to wait until he dies or sells out or else resort to law which should be about the last thing to do.

LAUGHLIN'S MUSINGS

I am sure all good farmers have visited the local fairs and got acquainted with new ideas, seen new plants that have been introduced in the last year that will benefit agriculture and visited with old friends. As an instance of the value of the right adaptation of crops we mention this: Soft wheat was tried in Kansas in the short-grass counties and many we know just came back home, starved out. But with the hard wheat and alfalfa introduced many have gone back and succeeded. Everyone should realize that there are many new things and plants to learn about. Old ways soon become obsolete. About the first thing when inside the gates we must look for the good old friends. (I mean humans) and get acquainted with new ones. Men of worth come and go as plants and to be up to date we must keep up with the men or with new ideas at least as well as with new plants.

Many of our farmer friends claim these local fairs are good places for an outing but while I try to make it a joy still work and close study has always been my aim at the fair. An outing to me is a relaxation from the first and last of my business—to make the contrast as great as work and sleep. We have for years tried to do this often. In the primitive man we come as near to no thinking and worry as possible to have, so for our outing with an invitation to one of those old friends, or a new one, as our fancy goes, we invite them to take a bonfire supper in the back pasture, or we meet at some bridge. This is not one of those clothes basket affairs, with so many good things to eat but the simplest we can think of. Did you ever try it. Let me give the menu:

The congenial good spirit,
Laughter sprinkled and thoroughly stirred with giggles.
Bread and butter sandwitches
Slices of bacon to broil on the end of a 3-foot switch (optional)
Relish in season
Pie or cake (compulsory)
Old and new stories

If I could not get a good liver squeezer by this short outing I believe I would try another way. I would just enjoy telling of the many "giggly" "smiling" or "rip-roaring" times I and mine have had, without the before worry and the after bad taste. But the editor would not stand for personal horn-tooting.

E. E. Laughlin, Bates County.

Suggestions on Seed Corn Selection

Because of unusual conditions this year, many farmers will find it desirable to practice early field selection of seed corn.

Seed corn may be safely selected the stiff dough stage; if properly cured. The vitality of corn selected earlier than this is likely to be uncertain.

Early picked seed corn must begin drying rapidly at the earliest possible moment. If left lying in a pile for as much as a few hours the growth of mold is likely to start.

In drying immature corn, it is important to keep the ears from close contact.

While drying, rain-proof buildings which provide a free circulation of air and a temperature above freezing are highly desirable.

Well-preserved seed corn a year old is very satisfactory.—Department of Experimental Agronomy, College of Agriculture, Nebraska.

A New Harrow

Whether you are in the market for it at this time or not, it will pay you as a matter of information for the future to drop a line to the Kramer Rotary Harrow Co. of 145 Main S. Morton, Ill., and ask them for their literature. They are on the market with a small rotary harrow which can be attached to any sulky plow. It doesn't require any extra horse draft and enables you to plow and pulerize the ground at the same time—thereby preventing clods and conserving moisture. It is an idea worth any farmer's investigation. Mention The Missouri Farmer when you write.

All of our readers should take advantage of this opportunity to get a beautifully printed copy of "After-Thoughts" free. See the announcement on page 8.

MURPHY HAS THEM

Twin City Tractor

Bull Tractor

The above Tractors will be shown in actual operation at the St. Louis Agricultural Fair from October 4 to 9, doing the many different kinds of farm work. Come and see these wonderful time saving, money making machines that will speak for themselves, and we will be glad to meet you and have you make your headquarters at our tent. If you can't come, write us, and we will be glad to give full particulars and best prices on anything in our line.

Murphy Machinery & Equipment Company,

1410 North Broadway, St. Louis, Mo.

Drain Your Lands

The Owensboro Ditcher & Grader Co., Box 837, Owensboro, Kentucky, is on the market with an inexpensive ditcher which enables farmers to cut a "V"-shaped ditch up to four feet in depth and thus drain their lands—carrying off the water, preventing erosion, etc. This ditcher costs little and is sent out on trial. Better write for full information and mention The Missouri Farmer.

Surely every thinking farmer wants to know how to protect himself against Hog Cholera. That's why you ought to get a copy of "Stamping Out Hog Cholera" which is described elsewhere in this issue.

A dollar bill sent at our risk will renew The Missouri Farmer for three years and we know you will get your money back several times.

The "Garden Spot" of Missouri

This Is a Designation Richly Deserved by the "Drainage District" of Southeast Missouri

Here is where farmers produce 40 bushels of wheat and 100 bushels of corn per acre, and the reason of it is that it is impossible to conceive of a soil more rich than ours. Never has Southeast Missouri presented a picture of greater opulence than this year. Everywhere the eye is greeted by great piles of wheat straw and jungles of corn. Truly this is a "Land of Plenty"—a land where Corn, Wheat, Alfalfa, Cotton, Watermelons, etc., flourish as nowhere else in the Mississippi Valley. What's the use of farming on worn-out land when you can get hold of a farm down here that will produce as much in one year as your worn-out farm will in four? We have a lot of fine farms for sale in the Malden District and every one of them will double in value during the next five years. This district is as healthy as you can find anywhere and you will have good schools and good neighbors. Write and tell us what size of farm you want to buy when we will give you the full particulars. Write to any Malden Bank about our honesty.

"We have some rich cut-over land which we are selling this year for $32.00 per acre on the following terms. $3.20 per acre cash and the balance in ten annual payments at 5% interest."

The Malden Real Estate Co.

THE MISSOURI FARMER

COLUMBIA, MO.

THE HOME OF MISSOURI'S GREAT AGRICULTURAL COLLEGE AND THE MISSOURI EXPERIMENTAL STATION

Time to Wake Up!

That the time is here when, following in the footsteps of the banker, merchant, professional man and the skilled laborer, farmers must organize in order that they may more effectively co-operate with each other is so apparent that added emphasis is almost criminally superfluous. It is, in truth, a fact which stands out like a light house in the whole field of American Agriculture—the overshadowing and overwhelmingly necessity of the hour. By this I do not mean a "Farmers' Trust" or an organization which shall seek to bring about conditions contrary to the normal laws of supply and demand—but simply a co-hesive amalgamation of farmers by communities which will make intelligent co-operation possible in those things which so vitally effect the Agricultural interests and upon which every farmer's individual prosperity and well-being so much depends.

A case in point is the Land Bank Law which was enacted by the last Legislature and which means more to the farmers of Missouri than any other act ever passed in the history of the state. If this measure becomes a law, it means that henceforth our farmers will be rescued from excessive interest rates and from embarrassing short-time loans. Under its provisions, farmers may borrow to the extent of 50% of the value of their farm lands for periods of from 5 to 25 years. The first $500,000 will be loaned at 4.8% (four and eight-tenths per cent) and subsequent loans at such a rate as the debenture bonds issued against farm notes will sell for in the open money market. That it means cheaper and longer time money than the farmers of this state have ever known before is true beyond the slightest question—but before it can become a law we must first carry a Constitutional Amendment at the polls in 1916. If a measure which meant as much as this one does to the farmers of Missouri had been passed in the interest of any other class of citizens they would be up in arms for it from one end of the state to the other—and yet to all outward appearances, the average Missouri farmer is "asleep at the switch" and unless this attitude changes quickly and powerfully the chances are the Amendment will be lost.

The other day we received a letter from a farmer up in Macon County saying, "Myself and neighbors have 15,000 or 20,000 bushels of apples for sale—and not a buyer in sight." We at once sent an inquiry to 40 or 50 apple buying concerns—and this illustrates again the deplorable lack of co-operation which exists for the sale of farm products. So, a case has come to our attention where a farmer up in Northwestern Missouri recently bought a couple of loads of feeders which a few days later he discovered had been raised within five miles of his farm. Here was a needless freight charge to the Kansas City Stock Yards and back again—and two needless commissions to a Live Stock Commission firm. Is it any wonder that under these circumstances there are so few farmers who are making any money—that the mortgage which hangs over thousands of farm homes is no nearer paid off today than it was five years ago?

While, ordinarily, I believe in supporting the home merchant, yet on such items as commercial fertilizer, tankage, cotton-seed meal, feed, etc., and other things which cannot be purchased advantageously in the smaller towns, thousands of dollars could be saved if the farmers of a given school district had some kind of an organization through which they could buy these things collectively. I know of one school district "Farmers' Club" which saved nearly $200 on binder twine during the recent summer—and so there are many other things which intelligent co-operation makes possible but which can never be realized so long as farmers pursue the present policy of "everybody for himself and the Devil take the hindmost." We have just prepared a circular on the organization of "Farmer Clubs" and we hope our readers will send for it at once. **The time is here to act!**

REDUCING THE COST OF FEEDING

In the early days, with land low in price, pasturage abundant, and feed and labor cheap, making a profit from live stock farming was comparatively easy, even though one possessed little knowledge of the principles governing the feeding and care of stock. Conditions have now changed. The great western prairies no longer offer rich fields free for the taking, and hence throughout the country fertile land has advanced in price. No less marked has been the increase in the cost of labor and of feeding stuffs. But the price of live stock products has also advanced, so that satisfactory profits may still be realized from farm animals. However, present conditions call for a more intelligent type of stock farming than has ruled in the past. Good profits are possible only when all the operations are planned intelligently and with good judgment, and there is a thorough appreciation of the requirements of the various classes of animals for food and care.

In the pioneer days of our country the feeds commonly used for live stock were restricted to the grains and forages grown on the farm. Knowledge of the value of these farm-grown products is not now sufficient for intelligent feeding. The problem is complicated by the host of by-products resulting from the manufacture of articles of human food which are offered on the markets as feeding-stuffs for stock. Many of these are valuable and economical supplements to the feeds raised on the farm. However, such products vary considerably in price and even more markedly a nutritive value. Most economical feeding is therefore possible only when the relative value of these different products compared with each other and with the farm-grown crops is clearly understood. In seeking a knowledge of feeds and of feeding we must first consider the plant substances which provide the nourishment for farm animals and study the manner in which these compounds are built up in the living plant. Next we should learn how the food consumed by animals is digested and utilized within the body for the production of meat, milk, work or wool, and should also study the requirements of each class of animals for food, water, shelter and exercise. Only then are we in some measure in a position to understand the value and merits for each of the farm animals of the many different feeds, and finally to consider the principles of care and management, the constant observance of which is essential to the highest success in animal husbandry.

The most important factor of all, for the farmer who must depend on the profits from his stock for his income, is the cost of the ration. In securing a ration which provides the nutrients called for by the standards and meets the other conditions previously discussed, lies a great opportunity for exercising foresight and business judgment on every farm where animals are fed. The wise farmer-feeder will consider the nutrient requirements of his animals in planning his crop rotations. Through the use of grain from corn or the sorghums, legume hay and such cheap succulence as silage from corn or the sorghums, it is possible in most sections of the country to go far toward solving the problem of providing a well-balanced, economical ration.

The feeds selected for any animal should be such that they will not injure its health or the quality of the product yielded. Feeds which are suited to one class of farm animals may not be adapted to others. Again, a given feed may give satisfactory results when combined with certain other feeds, yet in other combinations it may prove unsatisfactory. A few examples of such conditions are furnished in the following: Cottonseed meal in moderate amount is an excellent feed for cattle, sheep, and horses, yet it is so frequently poisonous to pigs that feeding the meal, as at present prepared, to these animals cannot be advised. While there is always danger from using feeds damaged by mold, such material may often be eaten by cattle when it would poison horses or sheep. Timothy hay, which is the standard roughage for the horse, is unsatisfactory for the dairy cow, and may cause serious trouble with sheep on account of its constipating effect.

Feeding cows a heavy allowance of ground soybeans produces unduly soft butter, while an excess of cocoanut meal makes the butter too hard. Peanuts and soybeans produce solt lard when forming too large a part of the ration of fattening pigs.

It is often highly beneficial to add wheat bran or linseed meal to the ration on account of their slightly laxative effect. On the other hand, when animals are already receiving such laxative feeds as silage, pasture grass, ad legume hay, the use of bran or linseed meal may be unwise.

With the horse and with young ruminants the ration must contain some roughage to distend the digestive tract properly. Futhermore, for the best results the proportion of concentrates and roughage in the ration should be regulated according to the kind and class of animal to be fed and the results sought. Cattle, sheep, and horses can be wintered satisfactorily on roughages alone, if of suitable quality. Even brood sows may be maintained chiefly on legume hay, when not suckling their young. In the rations for growing and fattening animals and those at work or in milk, a considerable part of the ration should consist of concentrates.—W. A. Henry and F. B. Morrison, Wisconsin Experiment Station .

"The Quality Goes IN Before the Name Goes ON"

The World's Greatest Pianists

appreciate the value of practice upon a clavier to such an extent that they buy a separate instrument of this type for the practice of fingering only. Certain styles of

Crown Pianos

are equipped with the famous Crown Practice Clavier which enables both music teacher and pupil to perfect fingering independent of tone. Furthermore, there is no wear upon the piano when the clavier is in use.

This feature of the Crown Piano is exclusive, being found in no other make. It is, however, only one of nearly 30 exclusive, patented features which make the Crown a most desirable instrument for both home and studio use.

Your selection of a Crown Piano means immediate and permanent satisfaction, and your choice is approved by nearly 70,000 satisfied users of these dependable instruments.

Send for our booklets which explain piano value, also what to look for in the selection of an instrument for your home. These booklets contain real piano information, and guided by them you are sure to select a good piano. They are FREE for the asking. Mail the Coupon TODAY.

Help Your Hens Moult. Tone Them Up

GILBERT HESS
M. D., D. V. S.

The quicker you get your hens over moulting, the sooner they will get on the job laying eggs. Moulting saps a hen's strength; to force out the old quills and grow new feathers needs lots of energy. Help your hens along with a tonic.

In Dr. Hess Poultry Pan-a-ce-a you have a scientific preparation that puts vigor and health into your flock—it will aid their digestion, build them up, give your hens the vitality to ensure quick feather growth, tone up the dormant egg organs and help them lay.

Dr. Hess Poultry Pan-a-ce-a

A Tonic—Not a Stimulant

Formula printed on every package

My Pan-a-ce-a contains tonics, blood builders and internal antiseptics; it is formulated after a prescription of mine which has had a successful record for 22 years. In this prescription I have combined scientific knowledge with poultry culture; behind it is my long experience as a veterinarian, doctor of medicine and successful poultry raiser.

My Pan-a-ce-a is easy to feed—put it in the mash wet or dry. Pan-a-ce-a is sold by a reliable dealer right in your home town whom you know. Read my guarantee.

My new Poultry Book tells all about Pan-a-ce-a. It's free.

1½ lbs. 25c; 5 lbs. 60c; 25-lb. pail $2.50 (except in Canada and the far West). Pan-a-ce-a costs only 1c per day for thirty fowl.

Dr. Hess Stock Tonic Expels Worms

It's almost a certainty that your hogs are wormy right now. I guarantee that my Stock Tonic will positively rid your swine of worms, tone them up and help them put on fat. I advise you also to feed my Stock Tonic to your horses, sheep and cattle as they go from pasture to dry feed. It will keep them in fettle, enrich their blood, keep the bowels regular and is a splendid aid to digestion. But especially as a hog worm expeller it will pay you to feed my Stock Tonic now and all winter. 25-lb. pail $1.60; 100-lb. sack $5.00. Smaller packages as low as 50c (except in Canada and the far West and the South). Why pay the peddler twice my prices?

Dr. Hess Instant Louse Killer

Kills lice on poultry and all farm stock. Dust the hens and chicks with it, sprinkle it on the roosts, in the cracks, or keep it in the dust bath, the hens will distribute it. Also destroys bugs on cucumber, squash and melon vines, cabbage worms, etc., slugs on rose bushes, etc. Comes in handy, sifting-top cans, 1 lb. 25c; 3 lbs. 60c (except in Canada and the far West). I guarantee it.

DR. HESS & CLARK
Ashland, Ohio

SHEEP, A PROFITABLE INDUSTRY

Missouri farmers are apparently overlooking a bet in failing to get back into the sheep business.

The demand for breeding ewes at the St. Louis market the past two months has been the greatest ever known in the history of the trade being far in excess of supplies. Those in close touch with the situation say that the native sheep supply in Missouri today is less than 50 per cent of normal.

While Missourians have had every incentive to buy breeding ewes this summer they failed to get into the game and as a result the larger proportion of ewes going back to the country from this point have been purchased by Kentucky farmers.

Kentucky and Tennessee, like Missouri, have been going out of the sheep business the past few years, being forced to this by drouth also by fear OCT 15—FOUR of cheap wool, due to the tariff change, etc. This year, however, Kentucky and Tennessee farmers are showing a keen desire to get back into the bandwagon and are picking up breeding ewes wherever they can be found.

Breeding ewes that went to Kentucky early this season sold around $5.70 per 100 pounds and that looked high at that time. However, the demand was so great that the market went up continually and recent purchases of breeding ewes here by Kentuckians were as high as $7.75 per cwt. A few days ago a well known Kentucky stockman, who already has about 1,000 sheep on hand placed an order with his local commission firm for two more cars of breeding ewes and wrote that he must have this stock and if forced to would pay anything up to $8.50 a head.

This indicates the favor in which the sheep business is regarded in those two southern states. Missouri ought to be one of the best sheep states in the Union but for various reasons her farmers have failed to grasp their opportunity.—Live Stock Reporter.

Incubators for Seed Testers

The state seed laboratory of Minnesota under W. L. Oswald, has demonstrated that the ordinary incubator used in the hatching of chickens is the very best kind of a seed corn tester.

"The advantages of the incubator as a seed tester are numerous. The most important of all is the fact that with an incubator almost ideal conditions can be maintained at any time in the winter. With a small incubator, therefore, a farmer may, in the winter months, test practically all of his seed and know just what he is going to put into the ground in the spring. If he has more than a sufficient supply of seed for himself he is able to put upon the neighborhood market seed of known value.

"It has been suggested that in communities where there are no incubators, farmers' clubs might unite in the purchase of an incubator to be used largely for seed testing."

The Missouri Farmer

VOLUME VII OCTOBER 15, 1915 NUMBER 20

Why Some Farmers Fail

By Geo. B. Ellis, Managing Editor

Not quite one-half the people of this country live on farms but they lack a very great deal of owning half the wealth of the Nation. The farmer certainly works as long hours as any other class; the plain life of the farmer is surely as economical as that of any other calling or profession; then why can it be that farmers do not possess their legitimate share of the wealth of the Nation? Farming is one of several industries which actually create wealth. From $9,000,000,000 to $10,000,000,000 of new made wealth—riches created from the soil, the air, the rain and the sunshine—is produced every year by the tillers of the soil but for some reason there are thousands of farmers who fail to enjoy many luxuries and some even the necessities which every industrious toiler is by right entitled to have. Out of the whole number of farms in Missouri operated by owners 57.6 per cent were free from debt in 1900 but ten years later, covering a period of unprecedented agricultural prosperity we find that only 53.7 farms out of every hundred were free from mortgage. This is pretty fair evidence that quite a number of farmers do fail to make enough to supply the wants of their families and to provide a home for their old age.

But why do some farmers fail? In a recent article in The Missouri Farmer a prominent farmer of Knox County, Mr. Henry Funk, said that farmers fail "because they do not realize that they are bound together in a society where their interests are all mutual. They do not avail themselves of the benefits derived from co-operation to increase production and to assign to each individual the labor for which he is best fitted. They do not avail themselves of the natural agencies. They profit by the muscular power of the horse, the gravitating power of water and the expansive power of steam and then turn down with impunity a good book on farming. They will go many miles to hear themselves flattered by some itinerant orator, but will refuse to attend a gathering intended to do them good, where the main speakers are right from the school of instruction which he helps to maintain." The above strikes two vital points. The first is the farmer's failure to avail himself of the benefits of co-operation and the second is the prejudice which so many farmers show towards the experiment station, the agricultural paper and other sources of information.

The Missouri Farmer has from time to time pointed out the value of co-operation along various lines and there is no good reason why the farmers in every school district in the state should not be firmly united for legitimate co-operation. But how many such societies are organized and at work? There are a great many things farmers can do better by co-operative effort. A few days ago we saw three farmers, small farmers, unloading a car of shorts and mill feed which they were taking out to feed young hogs. We learned that by co-operating these three farmers had saved twenty cents a hundred—$4 a ton, or about $60 on one car load of feed. The same day neighbors of these farmers were buying an inferior quality of shorts to feed for the same market and were paying the advance of $4 a ton. During the past two or three drouth years we have had throughout Missouri and the Central West, thousands of tons of hay and grain have been brought into Missouri and bought by farmers at from $3 to $5 a ton above what it could have been bought for under a system of co-operation. Is it any great wonder that some farmers fail?

Last week we visited a neighborhood in a good county in this state and we met up with two farmers who were keeping ten or twelve cows each and on both these farms there was a grade bull costing probably $50 when only a year old. For the same money these farmers by practicing co-operation could have had a splendid registered bull that would have added from $5 to $10 a head to the value of twenty calves, and still some farmers wonder why they fail!

For a number of years the experiment stations have taught that it was very expensive of feed to try to grow or to fatten animals without balancing the ration. Extensive experiments carried on at the Missouri, Nebraska, Iowa and other stations have shown the great saving in feeding hogs by supplementing the corn with tankage, oil meal, etc., but in face of these facts thousands of farmers are feeding the same old way on corn alone. When corn was valued at 50 cents a bushel and tankage at $44 a ton there was a saving in the cost of producing a hundred pounds of pork of 76 cents by feeding the two in comparison with corn alone. For several years The Missouri Farmer has been preaching the good things about alfalfa, rape, clover and oats for cheapening pork production, but in the face of it all a trip through the country will show a greater number of hogs being fed without these crops than those fed with them. Most farmers have accepted some form of pasture supplement for hogs, but too many of them are sticking to bluegrass, timothy and other common pasture grasses instead of trying to grow the better hog-forage crops such as alfalfa and rape. A bushel of corn fed on bluegrass produced 74 cents worth of pork when hogs were selling at 6 cents a pound, while a like bushel fed on alfalfa made $1.09, on rape $1.22 and on a combination of rape, oats and clover, $1.36. Will the readers of The Missouri Farmer tell us in the face of these demonstrated facts why it is that so many farmers refuse to accept them and possibly change the operations of the farm from failure to success? The answer must be "too much prejudice.." There are hundreds of facts useful to some farmers or to many farmers but they are not found in common farm practice because prejudice against book knowledge, farm paper knowledge and experiment station knowledge has shut them out. The remedy is to keep an open mind towards sound farm practice and scientific truths no matter from what source they come.

Another cause of failure among farmers is the lack of necessary capital to carry on the business in a large enough way to make a good saving out of it. Aside from the money that has been made from increased values of land few farmers have made money except they used capital enough to employ more than their own labor. One cause for the high rate of interest on farm loans has been the uncertainty of crops and unstability of prices, but as the country grows older and farming is reduced to a better system these causes will gradually disappear. But the primary cause for too high interest rates to farmers is that they have failed to co-operate and to mobilize their credit which has long been used to advantage by the farmers of European countries. And yet we call them slow, nonprogressive and flatter ourselves to believe that we are ahead of them in good farm practice.

In discussing the high rate of interest the farmers must pay on their loans, Dr. E. H. Bullock, a prominent Knox County farmer, recently made this statement: "That the average farmer has not been making a fair rate of interest on his investment has long been an established fact. The farmer knew this was the condition, but how to remedy it he did not know. Often the banker was compelled to refuse his farmer customer money, when the farmer's very existence seemed to depend upon the loan of the money for which he was asking.

"The conditions which exist in the loan business of our country are far from just to the farmer. He is compelled to pay the highest rate of interest of any class of men and at the same time he furnishes the best possible security. Why is this condition? Simply because the farmer can and does stand for it and not because it is just. What line of business could exist, but the farm busines of this country, add ten billions of wealth to the nation, do it on borrowed capital to the amount of six billions of dollars, on which was paid an annual sum of five hundred and ten million dollars interest? This is the condition that exists in the United States today. The farm wealth of this country is forty billions of dollars. We add ten billions to the wealth every year, on a borrowed capital of six billion dollars for which we pay a rate of eight and one-half per cent interest. The lender getting for his service and the use of his capital almost seven times the value of the loan. Do these figures stagger you fellow farmers? Well they are true. True as it is possible to make state and government reports. No wonder we are astounded when we stop to think of it, when we stop long enough to take an inventory of ourselves.

"Stupendous as all these figures are, and although the farmer adds twenty-five per cent of all there is invested in farm interests to the wealth of our Nation

Co-operation is the key note to farm community success. The individual may possibly succeed without co-operation but the community can not. Without co-operation there can be no good schools, live churches, dependable roads and a cultured society.

Prejudice is the cause of more farmer's failures than any other one thing. Prejudice closes the mind to progress, to new and improved methods for farm operations without which farmers can not succeed under twentieth century conditions. The farmer must seek knowledge from every source—from other farmers, from good books, from farm papers, from the experiment station—wherever truth may be found.

Farmers fail for want of sufficient capital to make needed improvements, to drain and clear the land, to buy better live stock and to increase the fertility of the soil. They fail because interest rates are too high when measured by the meager profits in the farm business. The greatest need just now to remedy this condition is the establishment of a system of rural credits that will give farmers long-time loans at a reasonable rate of interest.

Many farmers fail because they crop the land too heavily without returning any fertility to the soil. It costs more to cultivate a poor soil than it does a good soil and the owner of the poor soil comes out in debt at the end of the season. The remedy is more live stock, more pastures and more leguminous crops. Live stock consume feed that would otherwise go to waste—this feed is turned into cash and much of its value reproduced in future crops when it is returned to the land in the manure from the barn lot.

There may be other reasons why farmers fail but these are worth while thinking about.

annually, we are only making between three and four per cent annually on our investment. Where does the other twenty-one per cent go? And echo answers where. Will some of our business men, from banker to barber, tell us where it goes? Why don't the other fellows call us business men? It must be because we let the other fellow get nearly eighty per cent of the wealth we farmers produce."

The Missouri Farmer has for several months been trying to get this subject of better rural credits before its readers but we fear that many of them do not yet see the great and vital importance of the subject. For years land values have been on a speculative basis and the man who had a small margin to pay on the price of farm had a good chance to sell it at good profit in a few years even though he had not been able to show much profit in operating it. But in the future land prices will settle down to a producing value as they should, and the price of cultivated lands will be based on their earning power. When the opportunity is closed for a ma to buy a farm, hold it a few years, then sell it for enough to buy a cheaper farm further west—and that time is here now to a great extent—then there will be plenty of farm failures unless farming can be reduced to a more stable system and unless money can be borrowed at a rate that the profits of the farm will pay. For these reasons every farmer should study the Gardner Land Bank measure that is to be voted on in 1916 that he may be in a position to cast an intelligent ballot.

The last cause of failure we will have space to consider in this article is letting the fertility of the lad run down so that the crop will not pay a profit. There are some men who seem to fear that if they make their land rich and grow big crops that the price will go down and they will therefore have no more money than if they raise a poor crop. But we have noticed that the farmer who gets along best in the world is the one who keeps up the fertility and grows big crops. If possibly there should be danger of overproduction that is a matter that should be controlled by organization and co-operation and by reduced acreage and not by lessened yields.

One of the successful farmers of Pettis County in discussing this subject says, "The time is here when no farm can be successfully handled without a sufficient amount of live stock to consume all the feed stuff raised on the farm. The time is here and always will be, when any kind of good live stock will pay well to breed and grow on the farm. There is good money in breeding and raising cattle; there is good money in breeding and raising horses and mules; there is good money in breeding and raising hogs and sheep." Another successful farmer, D. L. Southerlnad of Johnson County, says, "I have bought several farms that had been used as exclusive grain farms and everything sold from the land until nothing could be made in farming it. Then by putting the land to grass and clover, and grazing and feeding on the land in a few years it became profitable to farm again. I have been feeding cattle and hogs for thirty-five yeasr and with the proceeds of this stock I have usually bought land and by this method I have paid for twenty-five hundred acres of land."

And so it goes, the man who would avoid failure must follow the systems that have proved successful with other men.

HEALTHFUL HOUSING FOR HOGS

The common ailments that are caused by weather changes and undue exposure to cold and wet, are just as liable to occur in hogs as in other animals. They contract "colds," influenza, sore throat, bronchitis and diarrhoea just as children, calves and lambs do when "chilled through and through" by exposure to cold and wet. The thick coat of fat of hogs furnishes them fuel for heat, and gives some protection from cold; but it is neither healthful for the hog nor economical for the owner, to burn too much hog fat to keep the herd halfway comfortable on cold nights. It is quite important to prevent, as much as possible, the common ailments mentioned above, in order to more successfully combat hog cholera. The congested and inflamed condition of the air passages, and the alimentary tract produced by exposure to winter storms, are conditions, especially favorable to contracting cholera, if the herd should become exposed to that disease. The resistance of the body is not only lowered so that the hog contracts cholera more readily, but serious complications are more liable to result, such as rupture of blood vessels in the lungs or bowels, and the development of an extensive pneumonia, or a severe type of bloody dysentery that will prove fatal to the animal.

Nothing can be much worse than to allow the hogs to sleep on manure piles and around straw stacks. The overheating of some of the hogs and the subsequent exposure to cold, can hardly fail to give them a severe attack of peumonia. Anti-hog-cholera serum will not prevent deaths from cholera in such cases. Proper housing and sanitation will in most cases save the hogs and prevent the expense of the serum bill The financial losses from lack of proper shelters, in many instances greatly exceed the cost of providing these essentials to successful hog raising.

The practical requirements in supplying shelters for swine on the average farm are that the shelters shall be comfortable and sanitary as well as convenient and not too expensive. The first two requirements relate particularly to the health of the animals. The hog shelters for winter should be constructed so as to prevent cold winds and rain from blowing in upon the hogs. A leaky roof, wet floors and cracks in the walls, on the windward side, that permit cold draughts to blow directly on the hogs, invite lung troubles and losses from hog cholera. Wherever it is possible, advantage should be taken of natural windbreaks in locating the winter shelters. A strip of timber or an orchard, at the north, and a sloping southern exposure of the grounds are advantageous.

The shelters should be built so as to permit good ventilation and access of sunlight in abundance to all parts of the interior. The aim should be to ensure a moderate degree of warmth, dryness, and a proper supply of fresh air. The shelters should also be constructed so as to be easily cleaned and disinfected; otherwise they will not be kept in a sanitary condition. If the essentials mentioned which are necessary for the maintenance of health are kept in mind, it does not matter so much about the style of the hog house or the materials used. Cheap structures that have been used for other purposes can at times be converted into comfortable hog sheds without much expense. Plans and detailed specifications for the different forms of movable and permanent hog houses that have found favor with practical hog raisers, can be obtained from the Animal Husbandry Department or from the office of the Agricultural Extension Service.

Summer Shelters: Hogs suffer quite as much from excessive heat as from cold, possibly more so; and their discomfort is great in midsummer in open fields where no shades are available. Even moderate exercise on hot days has in many instances caused death from "heat stroke." Hogs thus exposed suffer loss of vigor and resistance to disease, and are more liable to contract cholera if exposed to it. Under the conditions mentioned the hogs root out deep beds in the soil in their efforts to find a cool spot. These beds become in time very dry and dusty; and the inhaled dust sets up irritation of the bronchial tubes. The dust moreover may become infected with disease germs that produce coughs and bronchitis, or even pneumonia and cholera.

Movable shades can be provided at small expense that will give the hogs great comfort. These shades can be set at any convenient place in the fields that have been sown to rape, or other green forage crops for summer hog pasture. And if deemed advisable the shades can be moved about from time to time. A water barrel with a self-water device can be put under one corner of the shade, preferably the northeast corner, which is least exposed to the sun during the hottest part of the day.

A comparatively cheap and good hog shade is made by sharpening four fence posts at one end and driving them into the ground a foot or more deep at the corner of a twelve foot square. A fence board 1x6 12 ft. long is nailed near the top, joining the two posts on the north, and another board is nailed a foot lower, joining the two posts on the south, so as to give some slope to the roof. Boards are then nailed from the front to the back posts at the east and west sides. These boards are set on the slope so that the top edge comes even with the top of the front and back boards. A 2 x 4 scantling is nailed across east and west at the center between the sloping boards, so as to prevent sagging of the roof. Rough boxing or fence board can be tacked over the top. Straw may also be thrown over the top to further break the heat rays The sides are left open to allow currents of air to pass over the hogs. If the hogs show an inclination to root up the dirt floor under the shade, two strips of heavy chicken wire should be stretched over the floor after the soil has been smoothed down. The edges of the wire can be tacked to fence boards and these nailed to the bottom of the fence posts so as to hold the wire firmly in place. A layer of dirt an inch or so deep can be put on top of the wire and tamped down. An occasional sprinkling of the dirt floor to keep down the dust is advisable. An improved sprinkler may be made from an old tin bucket or a quart tomato tin by punching small holes in the bottom if a sprinkling can or hand spray pump is not available.

A simple pole-and-straw shade while not so durable and lets rain through makes a good sun break and should be provided if better materials are not convenient.

The cool shade supplied by these temporary summer shelters is far better than mud wallows to keep hogs comfortable and healthy.

J. W. Connaway, D. S. V., M. D.,
Missouri Experiment Station.

NOW AND THEN IN AGRICULTURE

Not long ago where Mr. Wright and I held a farmers' institute of two days and an evening, giving five talks each, the now and the then in agriculture were both in evidence. I never saw so many old gentlemen at an institute before. They never missed a session and were always on the front row of seats. The situation impressed me greatly for the majority of the gentlemen referred to do not farm actively any more, and the question as to why these men came night and day caused a line of thought that may be the answer. They were young farmers in the day of $1.25 an acre land, and the children that were there, possibly their grandchildren and great-grandchildren, who are to be the farmers of tomorrow are living in the day of $125 an acre land, and in the same neighborhood and on the same farms where these same gray-haired men began.

I could not but contrast these fine old men with some others I have met. These men had the intelligence to grasp the situation of sixty years ago and now. They were glad to lend every possible thing they could to help the young folks "make good" on $125 land, the very same on which they "made good" on the land costing them from $1.25 to $15 an acre.

These old gentlemen welcomed any who could give the young folks some farm information they themselves did not have. How often do we see the reverse of this even among old men. No good word for the College of Agriculture, the institute man, nor the county agricultural agent, all of which are primarily to help the young folks "make good" on high-priced land. It most certainly looks to me like such men should hang their heads for shame. They seem to forget that Uncle Sam paved the way for them, giving them cheap virgin soil and easy terms of payment. Yet when Uncle Sam and the State of Missouri seek to help under modern conditions these fellows object, and point out how they "made good." One way, a common one, is about like this: A man of my acquaintance has 800 acres of fine land that about the year 1898 cost him $35 an acre. He has refused $115 an acre and wisely, too, I think. An increase of $80 an acre that he did not earn, or $64,000 richer by the increase in the price of land alone, or $64,000 better off than if land had not "come up." Clear money, too, mind you. Do you reckon he made as much farming the land as the rise amounted to? $4,000 a year on 800 acres clear profit would be pretty good. Wouldn't it sound becoming to hear him "blow" about his fancy work on the farm? I know a man who owns great tracts of land that most of it cost him less than $1 an acre. He is selling it now at from $35 to $125 per acre. Wouldn't it sound fine to hear him brag about being a great farmer?

I have found at least two great classes of objectors to what they call "book farming." Listen to his remarks and look up some records as I have done, and you will commonly find the one who cannot point to a single act of his own that was to better his community unless the law compelled it, and the other is a "grand stander" nine times out of ten over his ears in debt.

Try it once. Listen to his clamor; then look him up, and if he has a dollar see if it does not look to him as big as a wagon wheel, or see if it really does not belong to somebody else.

Sam Jordan.

WHEN WE COME BACK

When our forefathers crossed the mountains in the East and got in touch with the fertile land of the upper Mississippi and Missouri valleys they thought that here was a land so deep, so fertile, so mellow that it would never fail. Our southern farmers have never imagined such a thing of any soil in the South, yet they did what was worse. They imagined that when they had worn out one farm there would be another one ready at hand. The amount of land which has been so reduced in fertility as to no longer pay for cultivation, by farmers who have entertained such ideas, would stagger the imagination of a conservative man.

A long time ago it might have been cheaper to sandbag nature and take away her wealth than to conserve the fertility of our soil. But good land has risen so in price, and the population has increased so that it behooves those who have good land, to keep it so and those who have not, to make it so.

The settlers in the wonderful Corn Belt country after years of constant cropping with corn found their yields failing. Then began to be worked out a system of rotation. The first and simplest rotation was a two-year one of corn and oats. This increased the yield for a few years but oats were not very profitable and the yields began to fail again. Then came the three-year rotation of corn, oats and clover. A slight variation of this—a rotation of corn, corn, oats and clover, giving one-half the land in corn instead of one-third, together with the three-year rotation, are the most popular cropping systems now.

The Southern man, on the other hand, soon found his land exhausted by constant cropping with cotton and corn. And it seemed that somebody had hogged all these new farm he was looking forward to. At any rate he found them harder to get than he had anticipated. What did he do? Why he commenced soil improvement work.

Unlike the level lands in the Corn Belt, the land that has had constant cropping in the South is usually cut into shreds with gullies. It seems no land washes so easily as the southern loam, when the timber is removed. In addition to being soft the soils are usually very unlevel. The southern man who has kept up the single cropping system for a number of years finally wakes up to the fact that his farm is not making him a profit and that every winter a large percent of his soil is washed down to the Gulf. The first thing he must do is to stop that everlasting washing. I am not in favor of terracing unless the land is so steep a cover crop will not hold it. By keeping our land in cover crops in winter and running our rows nearly level we are generally able to avoid expensive terracing.

In view of this fact it seems a popular rotation would be corn, oats, followed with cowpeas and cotton, using a winter cover crop of some kind every year. The farmer who rotated corn and cotton has long ago been lost in the shu e and is no more considered. And such will be the fate of the man who rotates corn, cotton, and oats. This rotation adds not an atom of plant food to the soil. On the other hand it is constantly depleting it. The rotation that will maintain or build up the fertility of your soil must include something that will put plant food into the soil as well as rest the land. The farmer who does not use legumes is a back number and must fall behind the procession of progressive farmers.

If you have ever examined the rooting system of your crops you found that the grain crops were usually shallow rooted. Cotton goes a little deeper but even so it does not penetrate into the subsoil. Then you found that the legumes were deep rooted plants—that they possessed deep, long tap-roots as well as long healthy lateral roots. Then why not take advantage of the knowledge you thus gained and plant a deep-rooted crop in rotation with your shallow rooted grain crops? If you fail to do this you are going to have a subsoil almost impervious to water and below the depths of the corn roots you will find hard-pan. Legumes overcome this difficulty. They sink their roots down where no roots have been before and lay hold on the supply of potash and phosphorous locked up there. There is in most all soils more potash and phosphorous in the subsoil than in the surface soil, but legumes seem to be the only plants that are able to take advantage of it. Only a very small per cent of it is available even to them. When they are turned under, however, the added humus exerts a refining influence on these minerals and breaks them down, making them more soluble. The roots, when they rot, leave passages through which the water and air are allowed to circulate freely thus hastening the availability of the potash and phosphorous.

I once knew a man who had grown corn on the same land for twelve years. The land had been poor when he got it yet he built it up and got a crop of corn every year. He made his corn rows six feet apart. He planted peanuts between the rows and sowed peas in the rows. The peanuts and corn were gathered but the peas and stalks were left for the hogs and cattle. When the hogs and cattle got through with them each fall he sowed a winter cover crop and let the stock graze the land all winter. Thus he saved the expense of feeding hogs and the trouble of spreading his manure. The last crop he raised was not the best one but it was very much better than the first. He used a like method on his cotton—planting peas and peanuts in the rows and then planting a winter cover crop and grazing.

Just at this time you ought to decide how you are going to increase the productivity of your land. Plan a sensible rotation as the first step, using in it as much legumes as you can. The other steps of adding live stock to your farm economy, and using the best means obtainable for preventing erosion, will come naturally.

Make the rain and the atmosphere your friends. With such partners as these, your possibilities on the farm are unlimited. Why, even the water that falls on your land contains nitrogen, in an available form, too. It is estimated that about five per cent of the nitrogen available on your land each year comes down in the rain. Make an honest effort to co-operate with nature next year and see what the partnership will do. If you do not co-operate with her you will be certain to arouse her jealousy, and when this is done you are lost.

Kolb Perkins, Cushing, Tex.

(Mr. Perkins is a Missouri-raised farmer and is still operating a Missouri farm. His advice to co-operate with the natural elements and to grow more legumes and raise live stock is the salvation of our future prosperity. Soil fertility is the foundation of all successful agriculture and without clover, alfalfa and other legumes raised and fed out on the farm it is a costly process to maintain fertility.)

International Harvester Oil Engines—Mogul—Titan

WHY buy an **International Harvester** engine? To stop the hours of back-breaking labor over a saw buck. To save the hours spent pumping water for thirsty stock. To save the wife the labor of washing, churning and cream separating. To make the farm a pleasanter place for yourself, your wife and your boys and girls.

And, if these are not reason enough—to save money. Considering the amount of hard work it will do, and the time it saves, an **International Harvester** engine is just about the best money maker on an American farm. Write to us for our books that tell what an engine will do, what it costs, and why it will pay you to buy our engine in the right size and style.

Or, your local dealer may sell **International Harvester** engines. See him, and ask him to show you one — a **Mogul** or a **Titan,** from 1 to 50-H. P. If he don't sell them write to us and we'll tell you who does handle them. You can't go wrong when you buy an **International Harvester** engine.

A Real Farmers' Club

The farmers of the Grindstone school district in Boone County have a "Farmers' Club" that is doing things. Last summer its members saved nearly $200 in buying binder twine—but co-operation in buying certain things which cannot be purchased advantageously in the local markets is only one part of the Club's activities. During the coming winter a weekly meeting will be held and on each meeting night some vital farm subject will be discussed. At the last meeting the Land Bank Law was explained—while "How to Grow Alfalfa," "Cowpeas, Soybeans and Rape," "Silos," "Soil Fertility," "Community Sires," "Better Public Roads," "Feeding Live Stock," "Controlling Hog Cholera," "Co-Operative Creameries," "Our District School" and other similar subjects are on the roster for the winter's discussion. A "leader" is appointed to lead the discussion on each meeting night after which there is a "free for all" exchange of ideas. "Our farmers are getting more keenly interested all the time," remarked the president to a represetative of this paper some days ago. "We are taking a deeper interest in our farm problems than ever before and every member declares he is getting much profit and enjoyment out of the weekly meetings."

Why shouldn't the farmers of hundreds of other school districts in Missouri do likewise? The Missouri Farmer has just issued a circular on which will be sent free for the asking which will be sent free fo rthe asking—and it contains the most vital discussion of co-operation among farmers that has ever appeared in print. Send for it today.

Selecting Seed Potatoes

The time to select seed potatoes is just as they are being dug. The only practicable method for selecting the seed for improvement is the hill method. It is no advantage to select the best tubers from the big pile after the potatoes are all dug. Where the potatoes are dug by hand each hill should be piled alone and then go along with a basket and take only those hills for seed which have a goodly number of smoothe even sized potatoes. Be guided in your selection by the whole number of potatoes in the hill and not by one or two potatoes no matter how fine they may chance to be.

WITTE Sells For Less

And gives you better engines. Sold Direct from Factory to Users. Cash or Easy Terms

WITTE Engines

Kerosene, Gasoline and Gas

2 to 22 H-P. Standard for all farm and shop work for 28 years. Recommended by users in all parts of world. No cranking; Long wearing; Steady power.

Liberal 5-Year Guaranty.

Engine shipped ready to work, easy to start and run. Catalog Free. Write for it now.

Live Stock at The Missouri State Fair

By R. P. ROYCE, Fieldman

With about half as many animals of the four beef breeds showing as were entered, the beef cattle show was a disappointment. One hundred and seventy-eight Shorthorns, Herefords, Angus and Galloways is not a good showing for Missouri. Cattlemen were expecting a great show in all breeds. It was assumed that most of the herds that would show at the American Royal would meet at Sedalia, and most of them were entered and planned to ship to Sedalia from Hutchison, Kan., but at the last minute the Missouri fair management overlooked a bet and failed to have a representative at the Kansas show to round up the exhibitors, and as a consequence the secretary of the Oklahoma State Fair succeeded in diverting a number of herds that would otherwise have competed at Sedalia.

While the Missouri show was woefully lacking in numbers the quality of the show was above criticism. Among the exhibits were some of the greatest herds of the various breeds. Much credit is due Superintendent R. M. Brown for the management of the show. Mr. Brown was almost alone responsible for getting what cattle were there. Heretofore Mr. Brown had the assistance of N. H. Gentry, a member of the state board of agriculture and director in charge of the beef cattle department of the fair. Mr. Gentry is the best known livestock breeder in Missouri and his sincere interest in the success of the state fair has always been sufficient to secure a representative show of all breeds. However, Mr. Gentry was dropped from the board this summer by Governor Major, and the man who succeeded Mr. Gentry as director in charge of beef cattle is a local politician, who is not in a position to induce breeders to show at Sedalia, even if he was disposed to build up a great show. It is truly unfortunate that politics is not sufficient to put across a great state fair—if it could be done by this method Missouri would have one of the greatest agricultural and livestock exhibitions in the country, for surely no fair is more surfeited with politics than Missouri.

THE BEEF CATTLE SHOW

The Shorthorns

It has been a long time since such a small showing of the red, white and roans has been made at Sedalia. Four exhibitors with thirty-six animals made up the Shorthorn show. In several classes there was little or no competition, in the aged bull class and again in the junior yearling bull class only one entry was led out. The quality of the entries was of state fair caliber in most classes, but the small number shown detracted from the interest. The Kilgour herd was the top-heavy winner, and aside from several first and seconds, won the junior champion bull, senior champion cow, and junior and grand champion female. The Uppermill Farm herd had the senior and grand champion bull in Sultan's Last.

Exhibitors: J. W. McDermott, Kahoka, Mo.; Joseph Miller & Sons, Granger, Mo.; J. A. Kilgour, Sterling, Ill.; Uppermill Farm, Wapello, Iowa.

Judge—Jno. E. Robins, Horace, Ind.

Bull, 3 or over—Uppermill Farm on Sultan's Last.

Bull, 2 and under 3—1, Uppermill Farm on Village Crest; 2, McDermott on Cainford Marquis 2nd.

Bull, senior yearling—1, Kilgour on Champion Goods; 2, Miller on Choice Cumberland.

Bull, junior yearling — McDermott on Golden Count 2nd.

Bull, senior calf—1 and 5, McDermott on Village Marshal and Golden King; 2, Miller on Correct Cumberland; 3, Uppermill Farm on Village Ordens; 4, Kilgour on Bessie's Monarch.

Bull, junior calf—1, McDermott on Scottish Marshal; 2, Kilgour on Fair Acre's Victor; 3, Uppermill Farm on Village Excellence.

Heifer, 2 and under 3—Kilgour on Fair Acre's Nell; 2, Uppermill Farm on Maxwelton Crown Rose; 3, McDermott on Blanche.

Senior yearling heifer—1, Kilgour on Bonnie Belle 14th; 2 and 3, McDermott on Fair Star and Fair Gift; 4, Miller & Sons on Oakdale Mayflower.

Junior yearling heifer—1, Kilgour on Silver Nell; 2 and 3, Uppermill Farm on Village Adelaide and Village Blythesome 3rd; 4, Miller & Sons on Oakdale Jealousy.

Senior heifer calf—1, McDermott on King's Gift; 2, Uppermill Farm on Village Violet; 3 and 5, Kilgour on Sweet Main 21st and Gloster's Duchess; 4 and 6, Miller & Sons on Gipsy Cumberland and Roan Queen.

Junior heifer calf—1 and 3, Uppermill Farm on Village Clara 6th and Village Venus 2nd; 2, McDermott on Roberta's Image; 4, Miller & Sons on Oakdale Augusta 3rd.

Senior champion—Uppermill Farm on Sultan's Last.

Junior champion bull—Kilgour on Champion Goods.

Grand champion bull—Uppermill Farm on Sultan's Last.

Senior champion cow—Kilgour on air Acre's Nell.

Junior champion cow—Kilgour on Bonnie Bell 14th.

Grand champion cow—Kilgour on Bonnie Bell 14th.

Aged herd—1, Uppermill Farm; 2, McDermott.

Young herd—1, Kilgour; 2, McDermott; 3, Uppermill Farm; 4, Miller &Sons.

Calf herd—1, McDermott; 2, Uppermill; 3, Miller; 4, Kilgour.

Four animals, either sex, get of sire—1 and 5, Kilgour; 2, McDermott; 3 Miller; 4, Uppermill.

Two animals either sex produce of 1 cow—1, Kilgour; 2, Miller; 3, McDermott; 4, Uppermill.

The Herefords

The show of Herefords was high class in every way. Six herds from Missouri, Iowa and Kentucky furnished twice as many entries as any other breed. The herds of O. Harris & Son and J. M. Curtice have been fighting it out all summer at the leading shows and naturally furnished the same battle at Sedalia for first honors that they had staged before. The championship honors were evenly divided between these two herds, the former annexing the senior champion bull and the junior champion female while the Curtice herd had the senior champion cow and junior champion bull. The Dallmeyer herd from Jefferson City and the Roe herd from Kentucky made keen competition for the lower places.

Exhibitors: W. H. Roe, Shelbyville, Ky.; W. Andrew & Sons, Morse, Iowa; W. A. Dallmeyer, Jefferson City, Mo.; O. Harris & Sons, Harris, Mo.; L. J. Smith, Pleasant Hill, Mo.; J. M. Curtice, Kansas City, Mo.

Bull, 3 or over—Harris on Repeater 7th.

Bull, 2 and under 3—1, Andrews on Bonnie Brae 60; 2 and 5, Curtice on Don Perfect 2d and Don Perfect 1; 3 and 4, Harris on Gay Lad 16th and Harris Standard.

Bull, senior yearling—1, Curtice on Don Perfect 4th; 2, Harris on Repeater 29th; 3, 4 and 5, Roe on May's Perfection 3d and Roohampton 2nd and 3d.

Bull, junior yearling—1 and 3, Curtice on Don Perfect 5th and Don Perfect 6th; 2 and 5, Dallmeyer on Premier Dare and Donald Dare; 4, Andrew on Bonnie Brae 84th.

Bull, senior calf—1 and 2, Harris on Repeater 57th and 66th; 3 and 6, Roe on Roehampton 11th and 10th; 4 and 5, Curtice on Don Perfect 9th and 11th; 7, Dallmeyer on Washington; 8, Smith on Stram Coli.

Bull, junior cal—1, 3 and 4, Curtice on Don Perfect 12, 13 and 14; 2 and 7, Andrews on Bonne Brae 93 and 90; 5, Dallmeyer on Roland Dare; 6, Roe on Roehampton 13; 8, Smith on British Swell, Jr.

Cow, 3 and over—1 and 3, Harris & Sons on Defender's Lassie and Miss Repeater 11; 2, Curtice on Donna Perfect 9th.

Heifer, 2 and under 3—1 and 2, Curtice on Vivian McDonald and Michief Maker; 3, Harris && Son on Miss Gay Lad.

Heifer, senior yearling—1 and 3, Harris & Sons on Miss Repeater 29th and Miss Perfection 9th; 2 and 7, Dallmeyer on Mildred Dare and Mary Dare; 4 and 6, Curtice on Bell Perfect and Donna Perfect 8th; 5, Andrews & Son on Miss Brae 58th.

Heifer, junior yearling—1, Curtice on Donna Perfect 10th; 2, Andrews & Son on Miss Brae 59th; 3, Harris & Sons on Miss Perfection 10th; 4, Dallmyer on Dorothy Dare; 5, Roe on Dorothy Donald 6th.

Heifer, senior calf—1, Harris & Son on Miss Gay Lad; 2 and 4, Curtice on Donna Perfect 16th and Betty Perfect; 3 and 7, Andrews & Son on Miss Brae 6th and Miss Brae 71st; 5, Dallmeyer on Rose Dare; 8, Roe on Dorothy Tampton.

Heifer, junior calf—1, 5 and 7, Harris & Son on Miss Gay Lad 37th, Miss Repeater 56th and Miss Repeater 59th; 2, Roe on Dorthy Hampton 13th; 3 and 4, Curtice on Donna Perfect 17th and Donna Perfect 18th; 6, Andrews & Sons on Miss Brae 70th; 8, Smith on Lady Teresa.

Senior champion bull—Harris & Son on Repeater 7th.

Junior champion bull—Curtice on Don Perfect 12th.

Grand champion—Harris & Son on Repeater 7th.

Senior champion cow—Curtice on Vivian Donald.

Junior champion heifer—Harris on Miss Gay Lad 32.

Grand champion cow—Curtice on Vivian Donald.

Aged herd—1, Harris & Son; 2, Curtice.

Young herd—1, Harris & Sons; 2, Curtice; 3, Dallmeyer; 4, Andrews & Sons; 5, Roe.

Calf herd—1 and 4, Curtice; 2, Harris & Sons; 3, Roe; 5, W. Andrews & Sons; 6, Dallmeyer.

Four animals, get of 1 sire—1 and 2, Harris & Son on get of Repeater and Gay Lad 6th; 3 and 6, Curtice on get of Don Perfect; 4, Dallmeyer on get of Paragon 12th; 5, Roe on get of Rothampton.

Two animals, produce of 1 cow—1 and 3, Harris & Sons on Harris Princess 31st and Harris Princess 65th; 2, Andrews & Sons on Miss Brae 19th; 4, Curtice on Lulu Perfect; 5, Andrews & Sons on Belle of Oak Grove; 6, Dallmeyer on Princess Camillus.

You'll get that go-to-it spirit, too.

"Caught P. A. pipe-joy on the first puff!"

That tip-top-clever-taste is *right there*—jimmy pipe or makin's cigarette—quick as you put a match to Prince Albert tobacco. Just makes you happy because it is so good and so satisfying! The patented process by which Prince Albert is made *fixes that*—and removes bite and parch! We *know* the goodness of

PRINCE ALBERT

the national joy smoke

We know it is *all there* in satisfaction; we know that you will delight in its flavor as you will welcome the absence of any tongue-bother.

We say to you: Lay down a nickel or a dime for a supply of Prince Albert, because it will please you more than any tobacco you ever smoked, it is so cool, and tasteful, and fragrant.

Prince Albert is sold everywhere in toppy red bags, 5c; tidy red tins, 10c; handsome pound and half-pound tin humidors, and in that fine crystal-glass humidor with sponge-moistener top that keeps the tobacco in first-class shape.

R. J. REYNOLDS TOBACCO COMPANY, Winston-Salem, N. C.

The Angus

The only criticism that could be offered on the showing of Angus was the lack of numbers. The quality of the show was never better and the two herds that competed are conceded to be the two best herds of the breed. These two herds have made the circuit together and usually at each fair several of the placings have been reversed. The Caldwell herd, the Missouri entry, won three of the championships. The show was easily one of the best ever seen in Missouri.

Exhibitors: C. D. & E. D. Caldwell, Burlington Junction, Mo.; Chas. Excher, Jr., Botna, Iowa.

Bull, 3 or over—1, Caldwell on Evreux of Harviestoun; 2 and 3, Escher on Ben Hur and Prince Felzer.

Bull, 2 and under 3—Caldwell on Black Cap Star.

Sennor yearling bull—Caldwell on Black Cap Bertram and Black Cap Star 2nd.

Junior yearling bull—Caldwell on Every Time and Quarters.

Senior bull calf—1 and 2, Escher on Promoter E and Black Right; 3, Caldwell on Caronial.

Junior bull calf—Caldwell on Evistos.

Cow 3 or over—1 and 3, Caldwell on Pride Petit and Erito; 2 and 4, Escher on Myra of Rosemere and Ley of Indianapolis.

Cow 2 and under 3—1 and 3, Caldwell on Erito and Esthonia; 2 and 4, Escher on Eulina 28th and Black Bird of Rosemere.

Senior yearling heifer—1 and 3, Escher on Bell Eclipse and Elassoma Erina; 2, Caldwell on Pride of Autumn.

Junior yearling heifer—1 and 4, Caldwell on Black Bird. Jan 2nd and Black Bird 156; 2 and 3, Escher on Enlotte and Blue Ribbon Lady.

Senior heifer calf—1, 2, 3 and 5, Escher on Black Bird Perfection, Pinky Pride, Kensington Lady E. and Elino E.; 4, Caldwell on Eloveta 4th.

Junior heifer calf—1 and 2, Caldwell on Erotus 2nd.

Senior and grand champion bull—Caldwell on Evereux of Harviestoun.

Junior champion bull—Caldwell on Black Cap Bertrano.

Senior and grand champion cow—Caldwell on Pride Petite.

Junior champion cow—Escher on Belle Eclipse.

Aged herd—1, Caldwell; 2 and 3, Escher.

Young breeder's herd—1, Escher; 2, Caldwell.

Calf herd—1 and 3, Escher; 2, Caldwell.

Four animals either sex, get of one sire—1, Caldwell; 2, Escher.

Two animals, either sex, produce of one cow—1 and 3, Caldwell; 2, Escher.

The Galloways

Missouri came to the front this year with a new Galloway entry. The firm of Swigart & Son, Salisbury, Mo., have again entered the show ring and only a few days before the fair purchased the show herd of G. E. Clark, Topeka, Kan. The other entry was the well-known Croft herd from Bluff City, Kan. These two herds furnished all the competition in the various classes and made a show that in point of quality ranked with any of the other breeds.

Exhibitors: C. H. Swigart & Sons, Salisbury, Mo.; M. & G. Croft, Bluff City, Kan.; G. E. Clark, Topeka, Kan.

Judge—Dr. H. M. Brown.

Bull 3 or over—1, Croft on Choice Master; 2 and 3, Swigart & Sons on Othello of Avondale and Marquis.

Bull 2 and under 3—1 and 2, Swigart & Sons on Echo of Capital View and Lord Othello 2nd.

Senior yearling bull—1, Croft on Enus; 2, Swigart & Sons on Nettie's Medalist.

Junior yearling bull—1 and 3, Swigart & Son on Othello Junior and Minnie's Medalist; 2, Croft on Omar.

Senior bull calf—1 and 2, Croft on Clarence th and Ross of Greenbush; 3, Clark on Chancy of C. V.

Junior bull calf—1, Clark on Captain 4th; 2, Croft on Kingsley Jr.

Cow 3 or over—1 and 3, Swigart on Nelly Melville and Dora 2nd of Kilquhanity; 2, Croft on Lady Love of Maples.

Cow or heifer, 2 or under 3—1, Croft on Pet of Green Bush; 2 and 3 Swigart on Sunflower Maid of C. V. and Baroness 2d of Avondale.

Senior yearling heifer—1, Croft on Es-

sie M. 2d; 2, Swigart on Mola's Pride of C. V.

Junior yearling heifer—1, Swigart on Lady Like of C. V.; 2 and 3, Croft on Lady of Greensbush and Ellen Brosn 2d.

Senior heifer calf—1, Swigart on Nettie's Best; 2 and 3, Croft on Owendaline and Lady 2d of Greensbush.

Junior heifer calf—1 and 3, Croft on Flo of Greensbush and Floss 6th of Greensbush.

Senior champion bull—Croft on Choice Master.

Junior champion bull—Swigart & Sons on Worthy Medalist.

Grand champion bull—Croft on Choice Master.

Senior champion cow—Swigart & Sons on Nellie Melville.

Junior champion heifer—Croft on Essie M. 2nd.

Grand champion cow—Croft on Essie M. 2nd.

Aged herd—1, Croft; 2, Swigart & Sons; 3, Swigart & Sons.

Young herd—1, Swigart & Sons; 2, Croft.

Calf herd—1, Swigart & Sons; 2, Croft.

Four animals, get of one sire—1 Croft; 2, Swigart & Sons.

Two animals, produce of one cow—1, Swigart & Sons; 2, Croft.

FAT CATTLE

Exhibitors: University of Missouri, Columbia, Mo.; Chas Escher, Botna, Iowa; W. A. Dallmeyer, Jefferson City,

SHORTHORNS

Judge—Dr. H. M. Brown, Hillsboro, O.

Steer or spayed heifer—University of Missouri on Surprise.

GALLOWAYS

Steer or spayed heifer, 2 and under 3—University of Missouri on Redland.

Steer or spayed heifer, senior yearling—University of Missouri on Wildwood.

Steer or spayed heifer, junior calf—University of Missouri on Foreman.

Group of 3 head—University of Missouri.

ANGUS

Steer or spayed heifer, 2 and under 3—1, Escher on The Ford; 2, University of Missouri on Ross of Edgewood.

Senior yearling—1, Escher on Erin's Lad; 2, University of Missouri on Prince of View Point.

Junior calf—University of Missouri on Censor.

Senior calf—Escher on Villi.

Group of 3—1, Escher on The Ford, Erin's Lad and Villi; 2, University of Missouri on Ross of Edgewood, Prince of View Point and Censor.

Champion—Escher on The Ford.

HEREFORDS

Judge—John E. Robbins, Horace, Ind.

Judge—John E. Robbins, Horace, Ind.

Steer or spayed heifer 2 and under 3—University of Missouri on Dispatcher.

Junior yearling—1, Andrews on Bonnie Boy; 2, University of Missouri on High Mark.

Senior calf—1, University of Missouri on Distinction; 2, Dallmeyer on Spinster.

Champion—Andrews on Bonnie Boy.

Group of 3—University of Missouri on Dispatcher, High Mark and Distinction.

Judges—Dr. H. M. Brown and John E. Robins.

Steer or spayed heifer 2 and under 3—1, University of Missouri on Jack; 2, Escher on Bon Ton.

Senior yearling—Escher on W. O. W.

Senior calf—1, Escher on The Kaiser; 2, Gentry & Son on unnamed entry.

Championship—Escher on The Kaiser.

Group of 3—Escher on The Kaiser, Bon Ton and W. O. W.

DAIRY CATTLE

Missouri should have one of the greatest dairy cattle shows in the country, and it is difficult to understand why a better show can not be staged at Sedalia. No state in the Corn Belt is showing more interest in dairy cattle than Missouri, but the fact remains that each year visitors at the State Fair are disappointed in the showing. This year the Jersey division had two very high class herds, both Missouri owned, and either a credit to the state and the breed. No fault can be found with the quality of the Jersey show but the same criticism offered in regard to the beef cattle can be made, namely, lack of numbers. It is to be hoped that the management of the fair will make a special effort to get a larger entry list for next year. It can be done if sufficient interest by the management is taken. Only one herd of Holsteins, and that one from Iowa, was on exhibition. The Missouri Holstein breeders have their state organization now and it is up to them to see that their breed has a creditable exhibit from Missouri herds. The cattle are here, it remains to get them out.

JERSEYS

Exhibitors: Wainscott & Klump, Nevada, Mo.; F. J. Bannister, Kansas City, Mo.; Longview Farm, Lee's Summit, Mo.; R. Y. Gibson, Jacksonville, Ill.

Bull 3 or over—1, Longview Farm on Queen's Raleigh; 2, Bannister on Beatrice Stockwell.

Bull 2 and under 3—Bannister on La Ciana's Den Ramon.

Bull 1 and under 2—1, Gibson on Majesty's Oxford Eminent; 2, Bannister on Flora's Queen Raleigh; 3, Wainscott & Klump on Countess Lad's Enler; 4, Longview Farm on Perfection Raleigh.

Bull calf under 1—1 and 2, Bannister on Golden Fern's Pathfinder and Queen Honeymoon Raleigh; 3 and 5, Longview Farm on Rezel's Raleigh Boy and Crossy's Golden Fern; 4, Gibson on Majesty's Oxford Majesty.

Cow 4 or over—1, Bannister on Beechland's Champion Lily; 2, 3 and 4, Longview Farm on Raleigh's Fairy Glen, Raleigh's Leda and Twodot.

Cow 3 and under 4—1, 2, 4 and 5, Bannister on Agatha's Maiden Fern, Noble's Dair Norissa, Warder's Fern Blossom and New Year's Golden Fern; 3, Longview Farm on Queen's Raleigh's Fontaine.

Heifer 2 and under 3—1 and 2, Longview on Raleigh's Financial Hope and Queen Rose of the Raleighs; 3, Bannister on La Cima's Dolcros; and 4, Gibson on Oxford's Coulisso.

Heifer 1 and under 2—1 and 4, Longview Farm on Raleigh's Majesty Crocus and Raleigh's Stockwell Girl—2, Gibson on Togo's Sultana; 3 and 5, Bannister on Paranas Noble Fern and Nobility's Lady Raleigh.

Heifer calf under 1—1, 3 and 4, Bannister on Cowslip's May Day, Shamrock's Ivy's Nancy and Sultana of Zanzibar; 2, Longview Farm on Raleighs Hopeful Finance; 5, Gibson on Majesty's Oxford Sultana.

Senior champion bull—Longview Farm on Queen's Raleigh.

Junior champion bull—Gibson on Majesty's Oxford Eminent.

Grand champion bull—Longview Farm on Queen's Raleigh.

Senior champion cow—Bannister on Agatha's Maiden Fern.

Junior champion cow—Longview Farm on Raleigh's Financial Hope.

Grand champion cow—Bannister on Agatha's Maiden Fern.

Exhibitor's herd—1, Longview Farm; 2, Bannister.

Breeder's young herd—1, Bannister; 2, Gibson; 3, Wainscott & Klump.

Four animals either sex. get of one sire—1, Bannister; 2, Longview Farm; 3, Gibson.

Two animals either sex, produce of one cow—1, Longview Farm; 2, Gibson; 3, Wainscott & Klump; 4, Longview Farm.

HOLSTEINS

Elliott Bros., Woodward, Iowa, were the only exhibitors of Holstein cattle.

DRAFT HORSES

The draft horse show this year was practically a local show inasmuch as all entries were Missouri horses with the exception of one stable from Iowa. What horses that were shown were very good but there were not enough to fill the classes as they should be filled. It is hard to understand why the Missouri fair management is unable to secure more heavy horses. Other state fairs seem to experience little difficulty in inducing the large importers and dealers to exhibit. Perhaps the Sedalia management is inclined to go a bit top heavy in the effort to attract the light horses. For several years past great pains have been taken to fill the $2500 saddle stake, and we have no quarrel on this feature, but we would like to see equally strenuous efforts made to attract the heavy horse men.

Prof. J. G. Fuller, of Madison, Wis., judged all the draft classes in a manner that brought forth praise from exhibitors and spectators alike.

PERCHERONS

Exhibitors: Smith Bros., Beaman, Mo.; W. E. Files, LaMonte, Mo.; Howell & Dawson, Paris, Mo.; H. A. Rotermund, Lincoln, Mo.; J. F. Roelofson, Maryville, Mo.; P. G. McCully & Son, Princeton, Mo.; A. S. Davis, Green Ridge, Mo.; A. M. Walker, Laclede, Mo.; M. D. Allcorn, Sedalia, Mo.; Crawford & Griffin, Newton, Iowa; W. J. Finley, Higginsville, Mo.; Otto Bros., Kirksville, Mo.

Stallion 4 and over—1, Otto Bros. on Astrakan; 2 and 4, Roelofson on Kroisuer Dynouns; 3, McCully & Son on Gaulois.

Stallion 3 under 4—1, Smith Bros. on unnamed entry; 2, Crawford & Griffin on Bismark; 3, Roelofson on Tableau.

Stallion 2 under 3—1 and 4, Crawford & Griffin on Nogent and Nadaree; 2, Lee Bros. on Brilliant; 3, Walker on unnamed entry; 5, Smith Bros. on unnamed entry.

Stallion 1 under 2—1, Crawford & Griffin on Shady Lawn's Best; 2, Roelofson on Belmont.

Stallion Foal—1, McCully & Son on Bob Dillos; 2, Files on Champagne.

Mare 4 and over—1, McCully & Son on Tong; 2, Allcorn on Kate Ross; 3, Smith Bros. on unnamed entry; 4, Files on June.

Mare 4 and over—1, McCully & Son on Dorothy.

Mare 2 and under 3—1, Howell & Son on Finale; 2, Davis on Hochette.

Mare 1 and under 2—1, Allcorn on Clara; 2, Roelofson on Etsu; 3, Davis on Javette; 4 and 5, McCully & Son on Favorite and Lady Oakland.

Filly foal—1, McCully & Son on Nettie May.

Group of 5 stallions—1, Crawford & Griffin.

Group of 3 mares—McCully & Son.

Stallion and 4 mares—McCully & Son.

Four animals either sex, get of one sire—Roelofson.

Two animals either sex, produce of one mare—1, Allcorn on Clara and Brilliant; 2, McCully & Son on unnamed entry.

Champion stallion—Otto Bros. on Astrakan.

Reserve champion—Crawford & Griffin on Shady Lawn's Best.

Champion mare—McCully & Son on Dorothy.

Reserve champion—Howell & Son on Finale.

(Missouri Bred Classes)

Two animals either sex, produce of one mare—1, Allcorn on Brilliant & Clara; 2, McCully & Son on Dorothy and Favorite.

Champion stallion—Smith Bros.

Champion mare—McCully & Son.

Percheron Specials

Stallion 3 or over—1 and 2, Roelofson.

Stallion under 3—1, Allcorn; 2, Roelofson; 3, Walker.

Mare 3 or over—McCully & Son.

Mare under 3—1, Allcorn; 2, Roelofson; 3, McCully.

Champion mare—McCully.

Get of sire—Roelofson.

Produce of mare—1, Allcorn; 2, McCully; 3, Roelofson.

Champion stud—McCully.

Five stallions owned by exhibitor—Crawford & Griffin.

Three mares owned by exhibitor—McCully.

Champion stallion open class—Crawford & Griffin.

Champion mare open class—McCully.

Stallion 2 under 3—1, Smith Bros. on Gamon; 2 and 5, Roelofson on Dynamo and Tableau; 3, Allcorn on Brilliant; 4, Walker on unnamed.

Stallion 1 under 2—1, Roelofson on Belmont.

Mare 2 or over—1, McCully on Dorothy; 2, Davis on Hochette; 3, Allcorn on Kate Ross; 4, Smith Bros on unnamed.

Mare 1 under 2—1, Allcorn on Clara; 2, Davis on Javette; 3, Roelofson on Elinor; 4 and 5 McCulley on Lady Oakland and Favorite.

Foal either sex under 1—1 and 2, McCulley on Nettie May and Bob Dillon; 3, Files on Champagne.

FRENCH DRAFT HORSES

Exhibitors: P. G. McCulley & Son, Princeton, Mo.; J. H. & H. A. Rotermund, Lincoln, Mo.

Stallion 4 or over—1 and 2, Rotermund on Zadox and Lenoir; 3, McCully & Son on Dexter.

Stallion 2 under 3—1 and 2, Rotermund on Markel and Isador.

Mare 3 or over—1, McCully & Son on Grieve; 2 and 3, Rotermund on Maxine and Carman.

Champion mare—McCully & Son on Grieve.

Champion stallion—Rotermund.

Stallion 2 under 3—1, Smith Bros. on Gamon; 2 and 5, Roelofson on Dynamo and Tableau; 3, Allison on Brilliant; 4, Walker on unnamed entry.

Stallion 1 and under 2—Roelofson on Belmont.

Mare 2 or over—1, McCully & Son on Dorothy; 2, Davis on Hochette; 3, Allison on Kate Ross; 4, Smith Bros. on unnamed entry.

Mare 1 and under 2—1, Allison on Clara; 2, Davis on Javette; 3, Roelofson on Elinor; 4 and 5, McCully on Lady Oakland and Favorite.

Foal either sex under 1—1 and 2, McCully & Son on Nettie May and Bob Dillon; 3, Files on Champagne.

Stallion 1 under 2—Rotermund on Danial.

Mare under 1—Rotermund on Dalmas.

Mare and foal—Rotermund.

Four colts either sex—Rotermund.

Missouri Specials

Stallion 1 under 2—Rotermund on Danial.

Mare under 1—Rotermund on Dalmas.

Mare and foal—Rotermund.

Four colts either sex—Rotermund

BELGIANS

Exhibitors: Crawford & Griffin, Newton, Iowa.

CLYDESDALES

Exhibitors: F. L. Crosby, Mexico, Mo.

JACKS AND JENNETS

Missouri always has a good jack and jennet show and this year was no exception to the rule. Eleven exhibitors showed forty-five head of very superior animals. The Monsees herd which always makes a splendid showing was missed this year.

Exhibitors: R. A. Robertson, Glasgow, Mo.; H. H. Taylor, Sedalia, Mo.; W. J. Finley, Higginsville, Mo.; Otto Bros., Kirksville, Mo.; Murry & Armstrong, Columbia, Mo.; L. W. Hoyt, Barry, Ill.; Bradley Bros., Warrensburg, Mo.; Shoemaker & Wyatt, Leeton, Mo.; M. D. Allcorn, Sedalia, Mo.; Hall Bros. Stanberry, Mo.; A. F. Hughes, Williamsville, Ill.

Judge—James Hamilton, Mexico, Mo.

Jack 4 and over—1, Otto Bros.; 2, Finley; 3, Shoemaker & Wyatt; 4, Taylor.

Jack 3 and under 4—1, Bradley Bros.; 2, Bradley Bros.; 3, Hall Bros.; 4, Taylor.

Jack 2 and under 3—1, Hoty; 2, Robertson; 3, Bradley Bros.

Jack 1 and under 2—1, Bradley Bros.; 2, Allcorn; 3, Hughes.

Jack colts—1 and 2, Bradley Bros.

Jennets 3 or over—1, Bradley Bros.; 2, Finley.

Jennet 2 and under 3—1, Finley; 2, Bradley Bros.

Jennet 1 and under 2—1 and 2, Bradley Bros.

Jennet colts—1 and 2, Finley.

(Continued on page 11)

Acid Stomach Claims Millions Of Hogs!

An enormous percentage of all hog losses is due to stomach disturbances and stomach disturbances are largely due to acidity, which interferes with the digestive juices and thereby impairs digestion. Result—thin, scrawny hogs that seem half-starved no matter how much they eat. Millions die. Thousands of hog raisers have proved that the safe and reliable way of neutralizing this acid and preventing its forming again is to mix just a little

MERRY WAR LYE

in swill, or with the drinking water, if the hogs are on dry rations. It not only neutralizes the acid but also sweetens the swill, thereby preventing the fermentation that causes the acidity. Moreover, it adds weight to hogs because it helps thorough digestion, leaving no waste food. Hogs come right up, under this simple treatment which produces amazing results.

There's as much difference in Lyes as there is in Doctors, so don't count any trial made with any other than Merry War Powdered Lye. The experience of thousands of hog raisers has proved the value of Merry War Lye. Its use is *not* an experiment.

Send for free booklet filled with letters from hog raisers. They will convince you. But a better way to be convinced is to give it a trial on your own hogs. The cost is practically nothing. It is absolutely safe to feed to hogs according to plain, easy-to-follow directions on label.

Keeps Poultry Healthy Merry War Powdered Lye mixed with feed or water according to directions on label, helps to make poultry sturdy and better able to resist White Diarrhoea, Diarrhoea from Indigestion, Cholera, Roup, Limberneck, Gapes, Worms, etc.

"There Are No Substitutes"

GENUINE GUARANTEED Wm ROGERS & SON FREE OAK DESIGN SUGAR SHELL

Send Only 3 "Merry War" Lye Trade-Marks

There are so many practical, every-day uses for Merry War Powdered Lye in the house and on the farm that we have made this remarkable gift offer to induce you to give it a common-sense trial. Don't send the entire labels—just cut out the trade marks—the large words "MERRY WAR" printed in red on the face of the label and send 3 trade-marks with coupon.

We will at once send you the Sugar Shell—one to a family on this special offer *and tell you how easy it is to get a complete set of this beautiful silverware absolutely free*—sufficient to last a lifetime.

For Sale Everywhere *None genuine without the words* "MERRY WAR" *and the picture of hog on the label.*

At grocers', druggists', and feed dealers'—10c a can. If your dealer will not supply you, we will see that you are supplied at $1.20 per dozen cans, all charges prepaid, and if requested we will take off 3 trade-marks and send Sugar Shell as offered also full particulars for obtaining full set *free*.

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

Vol. VII October 15, 1915 No. 20.

William Hirth - - - Publisher
Geo. B. Ellis - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year In Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct, always inclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

WHY HAVE CROP REPORTS?

The only valid reason we know for having the Government make a monthly statement of crop conditions and a final estimate of crop yields is that both the buyer and seller may have a reasonably accurate basis for making their deals. The Government is supposed to furnish more extensive and consequently more reliable data than any private agency can furnish and under ordiary conditions we think the reports are trustworthy. But when an unusual condition such as we have this year shows up it seems there is no one in the crop reporting service able to analyze the situation.

The October report of the Department of Agriculture estimates the total wheat crop of the coutry at more than a billion bushels which is 111,000,000 bushels more than last year's record breaking crop. The winter wheat yield this year is about 28,000,000 bushels less than last year but the spring wheat is about 139,000,000 bushels greater. With good crops in most of the great wheat countries these record figures are used very effectively for keeping down the price of wheat and there could be no reasonable ground for complaint if the figures of the Government told a true story but unfortunately they do not. There are millions of bushels of wheat raised this year that have been damaged by wet weather to such an extent that it can not be used for making flour and hence so far as the demand for bread is concerned this damaged wheat might be considered as so much corn or oats. The Government is failing in its duty to the country unless it shows how much of the billion bushels of the wheat crop is in fact wheat.

Throughout the best of the winter wheat belt there has been very great damage to the wheat crop and in some localities it is estimated by millers that as much as one-half the crop is unfit for making flour. One statistician of reputation estimates that at least 150,000,000 bushels of winter wheat is so damaged that it will have to be used for feed. These evidences lead us to believe that the amount of sound wheat available this year will be no more and more likely several million bushels less than last year. The trend of prices in the wheat market the last few days support this view and while we see no great chance for speculation in future wheat prices we see no cause for a panic among those farmers who have sound wheat stored in a good granary and the grain covered with an insurance policy.

PROGRESS IN SILO BUILDING

The great factor in silo building in this country and especially so in the Central West has been the dry years of 1911, 1913 and 1914. Thousands of farmers were driven to the silo as about the last means for keeping their live stock and saving corn in this way proved to be so much better than the old way that farmers are learning that a good silo is a paying investment on any farm where any considerable number of live stock are kept.

The secretary of the board of agriculture of Kansas has recently completed a silo census for that state and reports 9,695 silos which is about 92 for each of the 105 counties. More than one-fourth the whole number now in use, 2,550, were erected last year. The average is approximately five and six-tenths silos for every one hundred farms in the state. Unfortunately we have no means of taking a census in Missouri but applying the same ratio of silos to number of farms in this state would give us 15,950. If the average capacity of all these silos is 100 tons, and if we allow 14 acres of corn to the silo we have only three per cent of the corn saved in this manner.

We have been congratulating the farmers of the state for their activity in silo building the last three years but these figures show that there is room for several thousand more silos in Missouri.

The first cost of a silo is a considerable item for most farmers but when farmers learn more about their construction and learn to buy co-operatively so as to cut out the large middle man's fee a large percentage can be saved in first cost.

We would like for our readers who have been using silos to write us their experiences in building and tell us of the mistakes they have found they have made as well as the profits they have been able to get out of feeding silage.

LATE SOWN WHEAT

The Missouri State Board of Agriculture in the official crop report under date of October 9 states that wheat sowing this year will be unusually late, owing to wet weather, and fear of Hessian fly. On October 1 less than one-fifth the wheat area had been seeded and only about three-fourths of the wheat ground had been plowed. This condition will result in a decreased acreage according to the board's correspondents of about 21 per cent as compared with last year's crop. If this same condition prevails throughout the best of the winter wheat belt it will be an important factor in fixing the price of wheat in the next few months.

The late plowing of wheat ground and the heavy crop of weeds turned under in most fields will make it hard to prepare a good seed-bed for the wheat sown this season. Another handicap for late sown wheat is that it does not have time to tiller like early sown wheat. It is for this reason that it has been found advisable to make a heavier seeding for late sowing than what is found advisable in early sowing. Where the average date of seeding has required five pecks per acre it will be found best to sow around six pecks sown at this late date. Another factor that promotes tillering as well as early ripening is fertility and on the late seeding it is advisable to apply a liberal application of a high grdae fertilizer. A good yield of wheat can not be expected under normal conditions in 1916 unless the crop is started right this fall and the starting right means a good seed-bed, a good quality of seed and plenty of available fertility in the soil.

WAR AND PRICE OF PORK

The seizure and confiscation by Great Britain of several cargoes of meat shipped from America to Scandinavian ports may have a serious effect on the price of hogs and cattle in this country unless our Government can find some way to prevent such seizure in the future. During eight months ending with August, 1914, there were exported from the United States meat products valued at $81,000,000 and for the same eight months ending with August, 1915, the exports of the same articles amounted to $174,482,000, which is considerably more than double the amount. If Great Britain can maintain her policy of confiscating meats consigned to neutral ports under the pretext that it is destined for her enemies, it is sure to have a depressing effect on prices of meat and meat animals in this country.

The Department of Agriculture estimates that we have about 7 per cent greater number of hogs this year than last year and with a much larger corn crop to feed them with it is evident that we will need an outlet for a considerable surplus if prices are to be maintained.

Once more we call attention right here to the need of organization among the farmers of this country so that they might be in a position to guard their own rights. If the farmers of the United States could protest against this policy of Great Britain through some powerful alliance does any one doubt that our Government at Washington would get busy and that it would use the whole power of this great country to maintain our markets wherever we could find a buyer? It might do some good any way for farmers to write their Congressmen and United States Senators and ask them to insist that this policy of Great Britain be changed so as not to interfere with our legitimate rights.

MAKING ROADS WITH THE DRAG

In our last issue we stated that D. Ward King, the father of the split-log road drag, had graded and maintained a dirt road in first-class condition with no other implements than a plow and a road drag. Occasionally we find a man who will dispute this statement in spite of the positive evidence of the road itself. It took Mr. King several years to build up his road to a good crown but when it was done the road-bed consisted of numerous thin layers of clay pounded down by travel that made a much harder road surface than could have been secured by throwing up a high crown at one time. However we are of the opinion that most men will prefer to first put the road-bed in shape with improved road machinery and then use the drag for maintenance.

We would like to have a discussion of this subject in the columns of The Missouri Farmer by those who have had actual experience in road work. We do not want theories but we want actual experience and observation.

1. The best implements for dirt road construction.
2. The best implements for dirt road maintenance.
3. Can you start with the flat earth road and build a good road-bed with a plow and a King Split-Log Drag?
4. Have you built concrete culverts in your district and what has been your success?

FARMERS' CLUBS

The summer's work is over now and there is no better time to think about organizing a farmers' club in every school district in the state. These clubs may be organized at first with all members of society, men, women and children, participating. The first good result will be to foster a feeling of good fellowship and co-operation among the members of the community. As soon as the community is working harmoniously in literary and social lines it will be easy to take up economic subjects. If the roads in the community are not all that is desired a committee of four or five of the most progressive road men (or women) may be assigned the duty of suggesting a plan for improvement of the neighborhood roads. This plan should then be put before the club and discussed and when finally agreed upon the whole community will feel an interest in the work.

Briefly in the same way the improvement of the school, the church, the buying of feed and fertilizers, the finding a market for most any surplus products of the community may be taken up. After the club is working various activities will be found that will keep it busy and help the neighborhood.

TO OUR READERS

In our last issue we announced that we would present a free copy of the "After-Thought Stories" to those of our readers who like these articles and who send us one dollar for three years renewal—a splendidly printed booklet containing the best of these stories which have appeared during the last three or four years. If you want to take advantage of this fine offer there is no time to lose. Should the response not justify the printing we will offer to refund your money.

We are also willing to send a copy of our great new booklet on "Stamping Out Hog Cholera" to all who send us a dollar for three years' renewal—a book which not only tells how to control this pestilence which costs the farmers of Missouri millions of dollars every year but which also contains two invaluable chapters on Hog Breeding and Feeding.

In another part of this issue we also offer a splendid set of Dickens' novels at a ridiculous figure. Look up the advertisement elsewhere. Here is a whole winter's reading for only one dollar extra to the three years' renewal for the paper. These wholesome inducements are held out in order that you may permanently join our "Big Missouri Farmer Family"—that you may contribute your mite toward the fight which this paper is making for happier and more prosperous Missouri farm homes. We need your support and we need it now.

William Hirth, Publisher,
THE MISSOURI FARMER,
Columbia, Mo.

BUCKSHOT BY THE PROFESSOR

"Scrub" farmers and "scrub" live stock seem to like to associate together.

The farmer who puts thought into his work is the farmer who wins. Try it awhile and see.

We keep yelling for peace in Mexico —and yet we keep selling them rifles with which to shoot each other full of holes.

Get your corn out of the fields early. The when you smoke your old cob pipe around the "heatin' stove" it will taste better.

Gov. Major says Champ Clark is the "greatest livin' Missourian." Well, it's all right with me. If the other fellows can stand it, I can too.

I knew Woodrow would get all tangled up sooner or later—for usually when an old widower and a pretty widow meet there's something doing in the Cupid line.

Every farmer who raises hogs should have a copy of "Stamping Out Hog Cholera." By sending a dollar for three years renewal you can get a copy of this great booklet free.

There are a pile of farmers in the World who claim they "haven't got time" to read farm papers—but they are not the kind who own the big red barns and the good looking homes.

This is the time to pick your seed corn if you want a good stand next year. Picking the "good lookin' ears" out of the crib when you get ready to plant in the spring entitles you to membership in the "Hound Dog Farmers' Club."

Wouldn't you like to have a handsomely printed book containing all the best "After-Thought Stories" which have appeared during the last three or four years? If so, send a dollar for three years renewal when we will put you down for a copy. If the response don't justify our printing it we will refund your money.

I know of a little school district "Farmers' Club" in central Missouri where the farmers meet once every week and discuss some specific farm subject—and you have no idea how enthusiastic they are in their work. This summer the members of this Club saved nearly $200 in buying binder twine. The Missouri Farmer has prepared a circular which tells you how to organize a "Farmers' Club" in your district. We will be glad to mail you a copy of it free.

When the President gets through buying engagement rings and things of that sort, I hope he'll take an hour off and tell England that we will no longer stand for her confiscation of American meats consigned to neutral countries abroad. During the last few months she has appropriated $15,000,000 worth of American meat which, in the end, the farmer will have to lose by accepting a lower price for live stock. Surely we don't have to stand for these outrages simply because it's England?

THE GRANGE DOING THINGS

The Grange, which was organized 50 years ago, is a very live, working organization. It is doing more to bring peace, prosperity and harmony to the rural communities than any other farmers' organization. One has to observes only the effect in communities recently organized as an evidence of the above statements. At Derrahs in Lewis County, at Mound College in Scotland, at Clay in Adair, Cottage Grove in Randolph, at Lone Tree in Cass, at Masonic Hall and Salem Church in Johnson, and Railway Park in St. Louis County were carried out programs, recently, such as can only come from some concrete form of organization. The Grange is the farmers' training school and it is filling a long-felt want, that of trained leadership in the country. The farmer, without some concrete organization to assist him to develop his ability to think properly will often use his energy to his own detriment. Emulation is the strongest incentive to a better way of doing things and in no better way can this be developed than in our Grange meetings.

With our school system progressing equal to that of any other state, yet there is a vast work that must be done outside the school room to enable our boys and girls of the farm to get the most out of life. The number that are graduating from our high schools and colleges is daily increasing, but even then there are scores that are left to make the journey through life as best they can. The Grange has enabled many a young man and woman to discover themselves, and they have taken a new hold upon life and passed from that of a mediocre to a position of honor and trust, and the world has been the better for their having lived.

On June 24 I organized a strong Grange in Andrew County with 49 charter member and they selected Mr. Fred G. Howitt, a young man that had taken the Short Course at Columbia, as their Master, and Empire Prairie Grange will be heard from in no uncertain way in the future. It was, indeed, a rural community organized to build up and make better the social and educational conditions in every way possible. On August 23 I organized in Carroll County and the same general feeling prevailed, that of the community interest. Mr. O. P. Turner, a well-to-do farmer, was placed at the head, and that community will be doing things as never before. There seems to be a general feeling among the farmers that they should do something and to maintain an organization, and it is timely for every other business that is not fully organized to take care of its own. Such questions as better roads, better schools, better homes, better neighbors and last but not least, as with it the former things will be more easily secured, is the discussion of the Land Bank Bill passed by the last legislature. Brother Farmer, if you are interested why not call your neighbors together and decide to have a farmers' organization in your community, and if you decide upon a Grange, write me and I will help you to perfect an organization. "In union there is strength." Almost 600 new Grances is the record for the Grange organization of the United States this year. A reserve of $100,000 in the National Treasury and the order in Missouri building on a safe and sane foundation, one that brings pleasure and contentment to boys and girls of the farms as it gives them something to do, in amusement, recreation and the storing of the mind with new and useful ideas, with which to build the future.

C. O. Raine,
Master Mo. State Grange.

Information Every Farmer Needs

There is much of genuine value to the farmer-builder in the advertising literature of the Southern Pine Association, represented regularly in this paper. In its campaign of publicity, designed to emphasize the good qualities of Southern Yellow Pine for general building and repairs, the association has prepared a number of booklets and building plans, the work of experts, which are sent free to anyone who writes for them. There is much in this material to inform and aid the prospective user of lumber, whether he contemplates erecting a barn, silo, hog house or other building, or merely plans a few "odd jobs." The association's silo book, "How to Choose and How to Use a Silo," is, the publishers assert, the most practical work of the kind ever printed. It explains fully just how silage should be handled and fed, with cost estimates and tables of capacity of silos. There is no theorizing or speculating in this book—the information it gives is based on actual experiences of silo users; and while it advocates wood silos the sections devoted to growing, storing and feeding silage will be helpful to users of every kind of silos. The building plans give complete working designs for barns, bins, hog houses, poultry houses, feed racks, tanks and numerous other farm structures, with specifications, lumber bills and cost estimates. The number of these is being added to continually, the purpose beig ultinmately to provide plans suited to the needs of all classes of farmers, big and little. Another feature of the Association's free service is that of aiding and advising any user of Southern Yellow Pine in individual building problems. Requests for these free publications should be addressed to The Southern Pine Association, Inter-State Bank Building, New Orleans, La.

A Pocket Calculator Free

Almost every problem likely to come up in any line of business, office, store, farm or factory, is quickly answered by Ropp's New Calculator, saving hours of work, money and wrangle. This book is a competent and accurate authority. Prevents your own mistakes or the mistakes of others. It will save you many dollars every year. If you want to know the interest on any sum for any length of time at 3, 3½, 4, 4½, 5, 5½, 6 or 7 per cent, you can have the answer at once. The net proceeds of any bill is instantly found.

If your hired man wants to know how much is due him you can give him the figures by month, week or day. The book contains so much of value that it would be impossible to cover it in this space.

If you are a landowner, you can get a copy of this calculator free, by writing to the Keystone Steel & Wire Co., 4025 Industrial St., Peoria, Ill. They are sending this 50 cent book free to all landowners who are interested in better farm fencing and to help advertise their **square deal** fence which is built different from all others. The **square deal** fence book and Ropp's Calculator are both sent **free**, postpaid.

One dollar will renew your paper for three years and get you a copy of our splendid booklet "Stamping Out Hog Cholera."

HIGHEST QUALITY

Galloway made his reputation on high quality farm implements. Every Galloway engine, separator or spreader has sold from one to a dozen more in its neighborhood and this has been the cause of the growth of the wonderful Galloway business which keeps the Great Galloway Chain of Factories running at full speed from one year's end to the other.

Prices have been steadily lowered because of the wonderful volume of business that honest goods has created. The very finest material, the best skilled workmanship, superior finish, improved design, all parts standardized and alike and trued to the thousandth part of an inch—these are a few of the reasons for the high quality built into Galloway goods.

Galloway Engines Mean Horse Power That is Horse Power

26.75 34.75 39.50 77.50 98.75

Just look at this line of Galloway engines—every size and style fom 1¾ h. p. Air Cooled "Chore Boy" to 16 h. p. Portable Heavy Duty rigs that tackle the heaviest, hardest, toughest jobs. Their improved design, few parts, simplicity and finish cannot be improved. They are heavy weight, large bore and long stroke, low speeded, heavy duty engines that could not be built better if we charged twice as much as the new Low 1916 Prices. **Don't be fooled** into buying small bore, short stroke, high speeded engines that rack themselves to pieces in a short time if required to pull loads which their manufacturers claim they will handle.

My New Model 1916 Easy Running Sanitary Cream Separator 34.50

Is now being turned out of our Cream Separator Factories. If you knew all there is to know about building cream separators and had one made to your order, it would not be a better machine—would not not run any easier nor skim any closer and could not be built of better material, wear longer, nor would it be more perfectly sanitary. If you built as good a machine you could not sell it at a lower price than my 1916 figure. This separator has not been built down to a price, but built up to a high standard and sold to you at one small factory profit based on tremendous quantity.

Galloway's New No. 8 Low Down Manure Spreader--- 64.75 AND UP

Lighter draft than ever. Eleven specially patented features; all steel gears; flexible rake; built on heavy channel steel frame, trussed like a steel bridge. Sound, honest quality built into Galloway spreaders. That's why they've taken the country by storm. Only 42 inches high at center of box. Endless Force Feed. Beater drives from both rear wheels. Solid bottom. Any Galloway spreader will pay for itself in handling 100 loads.

My new 4-color, 160-page catalog describing these engines, separators and other farm imp'ements free for a postal. Don't buy until you have seen and read it. Full of bargains for every farm and household. Engines, spreaders and separators shipped from Kansas City, Chicago, Minneapolis, Council Bluffs or Waterloo.

WM. GALLOWAY CO., 597 Galloway Sta., Waterloo, Iowa D-25

PRICES STILL LOWER

There Are Certain Improvements You Want to Make

Make them this season and you'll save money for yourself. You'll never find a better time to buy lumber—your home dealer is stocked with particularly fine grades, and prices are more attractive than they have been in years.

There's a reason; The European war has cut off the exportation of millions of feet of American lumber that Europe used, and most of that lumber was of choice quality. Don't wait until the war is over, for Europe will demand every foot of America's surplus stock for rebuilding.

The dealer in your home town is supplied with

SOUTHERN YELLOW PINE

"The Wood of Service"

Ask him about it. Here's what the United States Government, in Agricultural Department Bulletin No. 99 says about Southern Yellow Pine:

Heavy, hard, very strong; tough; grain fine, even, straight; durable in contact with the soil. It may be had in long pieces, free from serious defects, and possesses great strength and stiffness.

Doesn't that description fit the wood you want to use? And the price—ask your dealer, and you'll find that no other lumber of anything like the good quality can be bought for so little.

If we can help you with up-to-date house and barn plans, silo advice, or other building information, FREE, fill out and mail TODAY the attached coupon.

Farm Management

D. H. Doane, University of Missouri

The following taken from the late Elbert Hubbard's magazine, the "Fra," sets forth a sentiment worthy of our consideration:

"The supreme prayer of my heart is not to be learned or "good," but to be Radiant. I desire to radiate health, cheerfulness, sincerity, calm courage and good-will. I wish to be simple, honest, natural, frank, clean in mind and clean in body, unaffected—ready to say, "I do not know," if so it be, to meet all men on an absolute equality—to face any obstacle and meet every difficulty unafraid and unabashed. I wish others to live their lives, too, up to their highest, fullest and best. To that end I pray that I may never meddle, dictate, interfere, give advice that is not wanted, nor assist when my services are not needed. If I can help people I'll do it by giving them a chance to help themselves; and if I can uplift or inspire let it be by example inference and suggestion rather than by injunction and dictation. That is to say, I desire to be Radiant—**To Radiate Life.**"

I was on the train about two weeks ago and among the passengers was a crowd of young men and girls who were having a pretty boisterous time. They were making remarks back and forth that could be heard practically all over the coach and in short, their conduct could hardly be called becoming young ladies and young gentlemen. Practically every passenger was disgusted with the things they were doing and the things they were saying. It was not long before someone suggested a song and they started in on cheap ragtime pieces which was in keeping with their previous actions. Soon some one started to sing "Juanita," and then followed some of the old melodies we all love and cannot think of except with appreciation and reverence. Soon their supply of these songs was exhausted and they started on religious songs. It is hard to describe the effect of these songs on that group of young people. As soon as their selections turned to the fond old melodies we dearly cherish, and when they sang the sacred songs, they quieted down and for the rest of the journey conducted themselves in a very becoming manner. I was never so impressed with the power of song as I was upon that occasion. The thoughts and tunes so wnoderfully expressed in our old masterpieces had a most wonderfully effective power of instilling higher thoughts and more becoming manners. These songs changed rowdyism to good manners; they changed boisterous activities to lady-like manners. The effect could be noticed all over the car, those who had been criticising and passing unfavorable comments, ceased their criticism or commented favorably. It changed the atmosphere and completely turned the attitude of the fifty to seventy-five people in that car from one of criticism to one of tolerance and good feeling. Truly, our old songs have a power we little realize. If we could use them more in our every-day life, if they could form a bigger part of the song life of our young people, it would mean untold good. This example shows that it was impossible for these boisterous, unlady-like girls and boys to carry on unbecoming conduct while singing and expressing thoughts so beautifully written in the civic and religious history of our past song life.

"That's steel"

Wabash steel cars are armor-clad, built of heavy steel plates, bolt-riveted to a massive steel frame of 68 tons—roof, walls, floor, all are steel.

Steel cars not only provide more security, but they ride smoother, because of their heavy weight; and steel construction allows more room in the aisles and between seats, and more ventilation space overhead.

WABASH to Chicago

Four Trains Daily

Lv. St. Louis 9:01 a.m., *1:00 p.m., *9:17 p.m., 11:55 p.m.
Ar. Chicago 4:53 p.m., 8:45 p.m., 7:00 a.m., 7:40 a.m.

Results of Cow Test Work

Two of our county agents, Mr. E. A. Ikenberry of Jackson County and Mr. L. V. Crandall of Buchanan County, organized cow test associations. The latter reports, after one month's work in reference to a particular instance as follows:

Mr. C. E. Rocklage, the cow tester for the cow testing association, has completed his first month's work. He found one registered Holstein cow which produced forty-eight pounds of milk which tested 4.8. This cow is producing 2.30 pounds of butterfat per day and the only feed that she is getting is pasture. This cow could have been purchased before the test was made for about two hundred and fifty dollars. The owner stated that he would not take three times that amount for the cow now. He also owns three hiefers from this cow and the cow testing work has materially increased their value. The owner stated that the testing of this one cow had paid for his testing work for the next ten years to come."

Mr. Crandall helped one of the members of the test association change the ration for his cows. This owner stated that this change cheapened the ration to the extent of $22.50 per month for his herd, and increased the milk flow on seven cows four pounds per cow per day. This shows some of the results from co-operation. Every community in Missouri could not successfully maintain a cow test association, but there is scarcely a community but what could work together to an advantage equally as great as that shown here.

The Uneasy Sheep Feeder

Does this heading apply to you? I surely hope not. While feeders have stayed high, still the market on fat lambs has been sufficiently high to justify the price asked for the feeders. Twenty-five cents raise on eight-cent lambs will let a farm management feeder who is following the farm management plan, out with seventy-five cents to a dollar profit per head.

We have had a few cold snaps in the past few weeks that make us a little uneasy. If we have clover or rape to finish up on we need not worry. If we are depending upon cowpeas and soybeans these cool evenings may make restless nights for the man with a considerable investment. Practically the only suggestion that I can make at this time is to utilize the perishable feed as quickly as possible and if the lambs are not finished then but can be sold at a profit, let them go. If there is other available feed that they can be turned onto that will withstand frost, or harvested feed that they will take hold of without a setback, they may be kept and finished. Of course, the finished lambs bring the highest price and under normal conditions make the most profit, but this does not always apply. Each man must size up his own situation and act accordingly. We will be glad to be of assistance in any specific instance if you will let us know.

The breeding ewe situation looks as favorable to me as it has for a good many years. A good class of ewes can be purchased for around six cents. These will bring lambs in the spring that will return the cost of the ewes, and if lamb prices remain high, receipts from the offspring will be greater than the cost of the ewes. The ewe wool clip would pay for the feed of the ewes and this will make over a hundred per cent investment in less than one year for the purchaser of a good bunch of western ewes now. If you are in doubt as to what to put your feed into, I believe that ewes make the best available proposition now.

Mr. Gartin's Clover

For the benefit of a correspondent about Mr. Gartin's clover, I will quote some further information from Mr. Gartin in reference to his fall seeded clover. Mr. Gartin says:

"Our clover in field A of last fall seeding is great. The best stand we ever saw; no open places in it. I enclose a few pictures of same.

"I see in The Missouri Farmer that Mr. L. F. Leyhe is asking about the seeding; for his benefit I would say we have grass seeder attachment on grain drill and we put the clover seed in it and drilled rye, and clover was

seeded in front of the disc and the clover was covered by the drill passing over the clover seed."

Farmers' Week, 1916

We are now starting our programs for the 1916 Farmers' Week. The best possible program is one that fills a need as the audience sees it. If you know of a subject that you would like to have discussed at this time, write us and let us know and we will endeavor to put in the Farmers' Week program this coming year the things that you want. This is a farmers' occasion and the program is made up on the basis of supplying the real needs of the Missouri farmer. You can help us tremendously by a few suggestions at this time.

A number of important things will come up for discussion at Farmers' Week this coming year. The different associations are taking steps to unite into one big organization. The new Land Bank Bill will probably be discussed, and matters of legislation that touch the vital interests of the farmer should be considered. Let us suggest at this time that the farmers take this opportunity to express their voice as a unit.

LIVE STOCK AT MISSOURI STATE FAIR

(Continued from page 7)

Best jack any age—Hoyt on 2-year-old.
Best jennet any age—Bradley Bros. on aged jennet.
Best jack and 4 jennets—Finley.
Jack and 4 jennets under 3—1, Bradley Bros.; 2, Finley.

THE MULES

Missouri's place in the sun as the premier mule state of the Union is in no danger as long as her breeders continue to produce the class of mules shown at Sedalia this year. Old mule men who have watched the shows closely in the past stated that in their opinion Missouri never had a better show. No class of live stock attracts more interest in this state than mules, and if one wants to see competition at white heat he need go no farther than the mule show at the State Fair. The entries this year were all of very high standard.

Exhibitors: M. A. Holloway, Clarksburg, Mo.; R. A. Fitzgerald, Bucyrus, Kan.; C. S. Miles & Sons, Norborne, Mo.; Gooding & Wares, LaPlata, Mo.; M. M. Marshall, Moberly, Mo.; F. M. Flinchpaugh, Kirksville, Mo.; C. J. Irvine, Marshall, Mo.; J. A. Cox, Graham, Mo.; Snyder Bros., Lowry City, Mo.; Otto Bros. Kirksville, Mo.; W. J. Finley, Higginsville, Mo.; H. H. Taylor(Sedalia, Mo.; J. A. Howell, Paris, Mo.

Judge—R. R. Buckner, Mexico, Mo.

Mules 3 and over—1, Marshall; 2, Snyder Bros.; 3, Holloway; 4 Finley; 5, Snyder Bros.

Mules 2 and under 3—1 and 4, Synder Bros.; 2, Gooding & Wares; 3, Gooding & Wares; 5, Irvine.

Mules 1 and under 2;—1, Flinchpaugh; 2 and 3, Fitzgerald; 4, Murry & Armstrong; 5, Snyder Bros.

Mule colt—1, Howell; 2, Murry & Armstrong; 3 and 5, Miles & Son; 4, Snyder Bros.

Pair mules 3 and over—1, Snyder Bros.; 2, Finley; 3, Marshall; 4, Holloway; 5, Miles & Son.

Pair mules 2 and under 3—1, Syder; 2, Gooding; 3 and 4, Irvine.

Pair mules 1 and under 2—1, Fitzgerald; 2 and 5, Snyder; 3, Irvine; 4, Flinchpaugh.

Pair mule cols—1, Irvine; 2, Snyder Bros.; 3 and 4, Miles.

Herd of 5 miles owned by exhibitor—1 and 3, Snyder; 2, Finley; 4, Irvine.

Champion mule—Marshall.

THE SWINE SHOW

"The best swine show Missouri ever had" was the unanimous opinion of all. Furthermore, in the opinion of competent judges Missouri had just about the best show that has been held this year, and the satisfying feature of the show was that most of the winning herds were Missouri owned. All breeds showed an increase except the Duroc Jerseys. The Poland Chinas registered 245 head, the Duroc Jerseys 174, Chester Whites 166, Hampshires 110, Yorkshires 37, Berkshires 23, and Mulefoots 7, a total of 762 head.

The extreme need of a new swine barn was never more forcibly demonstrated than this year when pen room was not sufficient to take care of all the entries. Temporary pens were constructed for several late arriving herds. The lack of room is not the only argument for a new building. The present structure—the poorest one on the grounds, is in no way satisfactory. Made of wood throughout, it is neither sanitary nor substantial. There is not a square foot of cement in the building and the facilities of mixing feed and washing are very bad.

A Magnificent Subscription Offer

Splendid Cloth Bound Six Volume

Dickens' Set Value - - - **$3.00**

The Missouri Farmer

For Two Years; Value $1.00

Value of Books & Paper $4.00

Special Offer $2.00

The Most Widely Read and Widely Loved Books in the English language are Charles Dickens. No matter how tastes differ or fashions change, the charm and appeal of Dickens is perennial. The characters he created are better known today than ever—and none can hope to attain a knowledge of English literature without reading again and again Dickens' best works.

By taking advantage of this great offer these six splendid volumes will only cost you One Dollar and we will mark up your subscription to THE MISSOURI FARMER for three years!

If you already happen to have a set of **Dickens** we will give you your choice among the following sets: **Stevenson, Kipling, Shakespeare, Hugo, Scott, Dumas, Poe, Lincoln.** Each of these sets comes in six splendid volumes and will afford a lot of fine reading for yourself and the children this winter. These books come from England where war conditions have destroyed the market for books—and never again will you have an opportunity to buy these classics **at such ridiculous figures!** If you would like several of the above sets and will ask your friends to subscribe for THE MISSOURI FARMER we will make you a proposition by which, through a little effort you can easily own all of them. **This offer will hold good for a short time only and you should therefore act promptly!**

No man or woman's education is complete until he or she has read these Great Classics which have been translated into every civilized tongue! Read them this winter and enrich yourself with the thought of the greatest writers the world has ever known

THE MISSOURI FARMER,
Columbia, Mo.

Gentlemen—Inclosed please find $2 for which mark up my subscription to The Missouri Farmer for three years and send me postpaid a six volume set of

The Poland Chinas

Poland Chinas set a new mark this year for quality and numbers. Twenty exhibitors, seventeen Missouri men, brought out an exhibit that won favorable comment from all. Every class was well filled, several classes having over twenty head, and one, the junior boar pig class had twenty-seven entries. Much credit is due the futurity for the splendid show of young stuff. In every class the competition was close and for the most part the judging was very satisfactory. The junior yearling boar class was particularly strong, six cracking good boars being shown. The Giant, Will G. Lockridge's remarkable young boar finally won the eye of the judge on account of his extreme size, bone and quality. This boar was afterwards made grand champion, but it was not easy sailing for he had to beat the junior pig shown by Shaw. The Shaw entry was an outstanding pig and when the championship honors were tied he had many friends who would liked to have seen him made grand champion.

For the most part the sow classes were well filled with high class entries. The aged sows and also the junior yearling sows made very attractive shows. M. D. Porter uncovered a surprise in the senior sow pig class and won in a class of twenty with an outstanding entry. The Porter sow was afterwards made grand champion sow.

Exhibitors: P. M. Anderson, Lathrop, Mo.; W. A. Baker, Butler, Mo.; W. Z. Baker, Rich Hill, Mo.; Bennet Bros., Lee's Summit, Mo.; John Belcher, Raymore, Mo.; Belcher & Bennett, Lee's Summit, Mo.; L. C. Burford & Sons, Monticello, Mo.; W. H. Burks & Sons, Bolivar, Mo.; S. Y. Burks, Bolivar, Mo.; T. E. Durbin(King City, Mo.; F. D. Fulkerson, Brimson, Mo.; John Gildow & Son, Jamesport, Mo.; Will G. Lockridge, Fayette, Mo.; M. D. Porter, Vandalia, Mo.;W. O. Pritchard, Walker, Mo.; Mark I. Shaw, Monroe Ia.; Jno. N. Titchenal & Bros., Brigton, Ill.; W. E. Willey, Steele City, Nebr.

Judge—Chas. Marker, Auburn, Ill.

Aged boars—1, Anderson on Iowa King; 2, Baker on Big Look; 3, Burks on H. A.'s Wonder.

Senior yearling boar—Baker & Son on Big Bone's Son; 2 and 3, Burks & Son on Long King's Choice and Royal Model.

Junior yearling boar—1, Lockridge on The Giant; 2, Durbin on Trusty King; 3, Baker on King Blain.

Aged sows—1, Baker & Son on Susie Hadley; 2, Baker on Josie's Best; 3, Willey on Big Lady B.

Sennor yearling sow—1 and 2, Willey on Anna Price 36th and Anna Price 34th; 3, Baker & Son on Pan Lady.

Junior yearling sow—1, Burks on Wonder Maid; 2 and 3, Willey on Big Lady D and Lady Big Orphan.

Senior boar pig—1, Burks on unnamed entry; 2, Porter on Pawnee Price 2d; 3, Baker on King Hadley, Jr.

Junior boar pig—1 and 3, Shaw on unnamed; 2, Porter on unnamed.

Senior sow pig—1, Porter on Smooth Big Lady; 2, Willey on unnamed; 3, Burks on unnamed.

Junior sow pig—1, Belcher on unnamed; 2 and 3, Baker & Son on unnamed.

Senior champion boar—Lockridge on The Giant.

Junior champion boar—Burks on unnamed entry.

Grand champion boar—Lockridge on The Giant.

Senior champion sow—Willey on Anna Price 36th.

Junior champion sow—Porter on Smooth Big Lady.

Grand champion sow — Porter on Smooth Big Lady.

Aged herd owned by exhibitor—1, Willey; 2, Baker.

Aged herd bred and owned by exhibitor—1, Willey; 2, Baker.

Young herd owned by exhibitor—1, Burk; 2, Shaw.

Young herd bred and owned by exhibitor—1, Burks; 2, Shaw.

Get of sire—1, Willey; 2, Burks.

Produce of sow—1, Willey; 2, Burks.

Poland China Futurity

Senior boar pig—1, Burks on unnamed entry; 2, Porter on Pawnee Price 2d; 3, Baker on King Hadley, Jr.; 4, 5 and 6, Baker & Son on Major B Look, 1st, 2d and 3d.

Junior boar pig—1, Porter; 2, Burks; 3, Burks & Son; 4, Baker & Son; 5, 6, 7 and 8, Belcher.

Senior sow pig—1, Porter; 2 and 3, Burks; 4 Baker, 5 Gildow, 6 Baker.

Junior sow pig—1, Belcher; 2 and 3, Baker; 4 and 5, Burks; 6, Baker & Son; 7 and 8, Baker.

Litter of four—1, 3 and 7, Burks; 2, Baker & Son; 4 and 8, Belcher; 5, Baker; 6, Baker.

The Chester Whites

Following the pace set by this breed at other shows this year the Chester Whites made one of the best shows ever seen at Sedalia. One hundred and sixty-six head from the leading herds of Missouri, Iowa, Ilinois and Michigan, furnished competition of very high order. J. J. Wills, who is making his first state fair circuit this year, won the aged boar class with International Boy, a boar that has met with universal approval all along the circuit. In the junior yearling boar class, which was particularly strong, Anderson was given first place on Royal Goods. The senior boar pig class brought out for first honors an outstanding boar, Sudbury, from the Doty herd. Sudbury was very

(Continued on page 13)

The Plunderer

By ROY NORTON

Author of "The Garden of Fate"

(Continued from last issue)

They had but little to tell her, yet she seemed to find it interesting, and her eyes had the absent look of one who listens and sees distant scenes under discussion to the exclusion of all immediate surroundings.

"Have you met Bully Presby yet?" she asked.

They smiled, and told her they had.

"He is a wonderful man," she said admiringly. "He makes his way over everything and everybody. He is ruthless in going after what he wants. He fears nothing above or below. I honestly believe that if the arch demon were to block him on the trail, Bully Presby would take a chance and try to throw him over a cliff. I don't suppose he ever had a vice or a human emotion. I believe I'd like him better if he had a little of both."

Dick laughed outright, and stared at her with renewed interest. He admitted to himself that she was one of the most fascinating women he had ever met, and wondered what vicissitude could have brought such a woman, who used classical illustrations, fluent, cultivated speech, and who was strong grace exemplified, to such a position. She seemed master of her surroundings, and yet not of them, looking down with a hard and lofty scorn on the very men from whom she made her living. He began to believe what was commonly said of her, that her virtue, physical and ethical, was unassailable.

There was a crash and a loud guffaw of laughter. They pulled the curtains farther apart, and looked across at the man who was celebrating. He had dropped a bottle of wine to the floor below, and was beseeching some one to bring it up to him.

Bill leaned farther out of the box to look, and suddenly the drummer saw him, pointed in his direction with a drumstick, and spoke to a girl leaning near by. She, too, looked up, and then clapped her hands.

"There he is!" she called in her high treble voice. "Up there in number five! The man that carried Pearl out and got burned himself."

Some man near her climbed to the little stage and pointed, took off his hat, and shouted: "A tiger for that man! Now! All together! Whooee! Whooee! Whooee! Ow!"

In the wild yell that every one joined, Bill was abashed. He shrank back into the box, flushed and embarrassed, while Dick laughed outright, with boyish enjoyment at his confusion, and The Lily watched him with a soft look in her eyes, and then stared down at the floor below.

Suddenly her figure seemed to stiffen, and the look on her face altered to one of cold anger. She peered farther over as if to assure herself of something, and Dick, following her eyes, saw they were fixed on a man who stood leaning against one of the pillars near the entrance to the dance floor. He alone, apparently, was taking no part in the demonstration in Bill's honor, but glowered sullenly toward the box. It took no long reasoning for Dick to know why. The man was the one who had been the watchman at the mine when they arrived.

The band struck up again, and another dance began, the enthusiasts forgetting Bill as quickly as they had saluted him; but the ex-watchman continued to lean against the post, a picture of sullenness, and in the box The Lily stood with knitted brows, as if trying to recollect him.

"Well," she said at last, "I must go now. Come and see me whenever you can, both of you. I like you."

They arose and followed her out of the box, and down the flimsy stairs that led to the floor below. She paused on the bottom step, and clutched the casing with both hands, then tried to get a closer look at the ex-watchman, who had turned away until but a small part of his face was exposed. She walked onward, still looking angrily preoccupied, to the end of the bar, and the partners were on the point of bidding her good-night, when she abruptly started, seemed to tense herself, and exclaimed: "Now I know him!"

The partners wondered when she made a swift clutch under the end of the bar and slipped something into the bossom of her jacket. She took five or six determined steps toward the ex-watchman and tapped him on the shoulder.

He whirled sharply as if his mind had guilty fears, and faced her defiantly.

Those immediately around, suspecting something unusual, stopped to watch them, and listened.

"So you are here in Goldpan, are you, Wolff?" she demanded, with a cold sneer in her voice.

He gave her a fierce, defiant stare, and brazenly growled: "You're off. My name's not Wolff. My name's Brown."

"You lie!" she flared back ,with a hard anger in her voice. "Your name is Gus Wolff! You get out of this place, and don't you ever come in again! If you do, I'll have you thrown out like a dog."

He glowered at the crowd that was forming around him, as crowds invariably form in any controversy, and then started toward the door, but he made a grave mistake. He called back a vile epithet as he went.

"Stop!" she commanded him, with an imperious, compelling tone.

He half-turned, and then shrugged his shoulders, and made as if to move on.

"Stop, I said!"

He turned again to face a pistol which she had snatched from her jacket, and now the partners, amazed, understood what that swift motion had meant. He halted irresolutely.

"You used a name toward me that I permit no man to use," she said fiercly. "So I shall explain to these men of Goldpan who you are, Gus Wolff! You were in Butte five years ago. You induced a poor, silly little fool named Rose Trevor to leave the dance hall where she worked, and go with you. You were one of those who believe that women are made to be brutalized. But good as most of them are, and bad as some of them are, there is none, living or dead, that you are or were fit to consort with. You murdered her. Don't you dare to deny it! They found her dead outside of your cabin. They arrested you, and tried you, and should have hanged you, but they couldnt' get the proof of what everybody believed, that you—you brute—had killed, then thrown her over the rocks to claim that she had fallen there in the darkness."

She paused as if the tempest of her words had left her breathless, and men glared at him savagely. It seemed as if every one had crowded forward to hear her denunciation.

"Bah!" she added scornfully. "The jury was made up of fools, and men knew it. The sheriff himself told you so when he slipped you out of the jail where he had protected you, and let you loose across the border in the night. Didn't he? And he told you that if ever you came back to Butte he would not turn a hand to keep you from the clutches of the mob;; didn't he? And now you are plain 'Mister Brown,' working somewhere back up in the hills, are you? Well, Mr. Brown, you keep away from the High Light. Get out!"

Some one made a restless motion, and declared the man should be hanged, even now, but The Lily turned her angry eyes on the speaker, and silenced him.

"Not if I can help it, or any of my friends can," she said cooly. "There'll be no mobbing anybody around here. I've said enough. Let him alone, but remember what kind of a blackguard he is. That's all!"

She turned back and tossed the pistol behind the bar, and the crowd, as if her words and the advice of the more contained element prevailed, resumed its play. She looked up and saw the partners waiting to bid her goodnight, and suddenly bit her lip, as if ashamed that they had seen her fury unmasked.

"We're going now," Bill said, reaching out his hand. She did not take it, but looked around the room with unreadable eyes.

"I'll walk with you to the beginning of your trail," she said. "I'm sick of this," and led the way out into the night.

For half the length of the long street she strode between them, wordless and then suddenly halted and held her arms apart appealingly.

"What must you think of me?" she said, with a note of grief in her voice. "Oh, you two don't know it all! You don't know what it takes to make a woman, who tries to be decent, rebellious at everything under the skies. What brutes there are walking the earth! Somtimes, lately, I begin to doubt if there is a God!"

"And that," exclaimed the quiet, steadfast young voice at her side, "is unworthy of you and your intelligence."

She halted again, as if thinking.

"And I," said the giant, in his deep, musical tones, "know there's one. It takes more than men to make me believe there ain't. I know it when I look at them!" He waved his hands at the starlit mountains surrounding them, and towering in serenity high up to the cloudless spaces.

"I'd be mighty ashamed to doubt when I can see them," he said, "and if they went away, I'd still believe it; because if I didn't, I couldn't see no use in livin' any more. It's havin' Him lean down and whisper to you once in a while, in the night, when everything seems to be goin' wrong, 'Old boy, you did well,' that keeps it all worth while and makes a feller stiffen his back and go ahead, with his conscience clean and not carin' a cuss what anybody says or thinks, so long as he knows that the Lord knows he did the right thing."

She faltered for a moment and Dick, staring through the darkness at her, could not decide whether it was because the woman in her was melting after the storm of anger or whether she was merely weighing his partner's words. As abruptly as had been any of her actions in all the time they had known her, she turned and walked away from them, her soft "Good-night" wafting itself back with a note of profound sadness and misery.

"I've decided what she is," Bill said, as they paused for a last look at the lights of the camp. "She's all woman, and a mighty good one, at that!"

CHAPTER VIII

THE INCONSISTENT BULLY

"Them beans," declared the fat cook, plaintively, "looks as if they had been put through some sort of shrivelin' process. The dried prunes are sure dry all right! Must have been put up about the time they dried them mummy things back in Egypt. Apricots? Humph! I soaked some of 'em all day and tonight took one over to the shop and cut it open with a chisel to see if it was real leather, or only imitation. The canned salmon and the canned tripe is all swelled so that the cans is round instead of flat on the ends. I reckon you'd better go down and see that storekeeper. I dassen't! If I did I'd probably lose my temper and wallop him. If somebody don't go, the men here'll be makin' a mistake, blamin' it on me, and I can't exactly see how they could keep from hangin' me, if they want to do justice."

He had stood in the doorway of the office to voice his complaint, and now, without further words walked away toward his own particular section of the little camp village.

"So that's the way that trader down there filled the order, is it?" Dick said, frowning at his companion.

The latter merely grunted and then offered a solution.

"Probably," he said, "that stuff was sent up here without bein' opened, just as he got it. If that's so it ain't his fault. About half the rows in life come from takin' things for granted. The other half because we know too well how things did happen."

He stood up and stretched his arms.

"What do you say we go down and hear what the trader has to say? If he's square he'll make good. If he ain't—we'll make him!"

Taking it for granted that the younger man would accompany him, he was already slipping off his working shirt and peering around the corners of the room for his clean boots. Dick hesitated and had to be urged. He wondered then if it were not possible that something beside the errand to the trader's caused Bill's eagerness, but wisely kept the idea to himself.

The camp was in the dusk when they entered it, the soft dusk that falls over early summer evenings in the hills, when everything in nature seems drowsily awaiting the night. They thought there was an unusual hush in the manner of those they met. Men talked on the corners or in groups in the doorway with unaccustomed earnestness. Women leaned across window sills and chatted across intervening spaces with an air of anxiety; the very dogs in the street appeared to be subdued. At the trader's there was not the usual small gathering of loungers, squatted sociably around on cracker boxes and packing cases, and the man with the twang was alone.

"Say, there's something wrong with that stuff you sent us," Bill began, and the trader answered with a soft, absent-minded, "So?"

Bill repeated the words of the cook; but the storekeeper continued to stare out of the door as if but half of what was said proved interesting.

"I'll send up and bring it back tomorrow," he replied when the miner had concluded his complaint. "The fact is it's a job lot I bought in Portland, and I didn't look at it. Came in yesterday. I ain't—I ain't exactly feelin' right. I suppose you heard about it?"

The partners looked at him questioningly, but he did not shift his eyes from the door through which he still appeared to be staring away into the distance, and it was easy to conjecture, from the expression of his eyes, that he was seeing a tragedy.

"I'm sort of busted up," he went on, without looking at them. "You see I had a brother over there. A shift boss, he was. Him and me was more than brothers. We was friends. It don't seem right that Hiram was down there, in the dark, when the big cave came—came just as if the whole moun-

FREE Gun for Boys!

Every normal boy wants to own a gun and since the rabbit and hunting season generally is here now, we have concluded to offer FREE to the boy readers of THE MISSOURI FARMER the beautiful single barrel, breech loading shot gun illustrated herewith. It is a 12-bore, made of the best materials throughout **—a gun of which any boy may justly feel proud!** These guns will be given away **absolutely free** to every farmer boy who will do a little hustling for us in his neighborhood. Our conditions are **so easy** that any bright boy can comply with them. If you would like to own one of these beautiful guns, **write us at once for full information! There is no time to lose. Write today!**

THE MISSOURI FARMER, - Columbia, Mo.

tain wanted to smash them men under it. It don't seem right! I can't quite get it all yet. I'm going over there on the stage in the mornin.' He's left a widder and a couple of little shavers. I'm goin' to bring 'em here."

"We don't quite understand you," Dick said, hesitatingly, and with sympathy in his voice. "We haven't heard about it—whatever it is. I'm sorry—"

The trader straightened up from where he had been leaning on his elbows across the counter and they saw that his face was drawn.

"Oh, I see," he said, in the same slow, hopeless voice. "I forgot you men don't come down here very often and that my driver never has anything to say to anybody. Why, it's the Blackbird mine over across the divide —on the east spur. Bad, old-fashioned mine she was, with crawlin' ground. Lime streaks all through the formation and plenty of water. Nobody quite knows how it happened. There was a big slip over there a few days ago on the four-hundred-foot level. Thirty odd men back of it. Timbers went off, they say, like a gatlin' gun. I just can't seem to understand how they didn't handle that ground better. It don't look right to me!"

He stooped and twisted his fingers together and the palms of his hands gave out dry, rasping sounds. His attitude seemed inconsistent with the immobility of his face, but Dick surmised that he was trying to regain control of his emotions. He had a keen desire to know more of the particulars of the tragedy, but sensed from the storekeeper's appearance that he was scarcely able to give a coherent account of it. His words had already told his sorrow. Bill's voice broke the pause.

"We're right sorry we bothered you about the supplies," he said softly. "But we didn't know, you see. I reckon we ain't in any big hurry. You just take your time about fixin' it up. We can live on most anything for a day or two."

The storekeeper looked at him gratefully and then lowered his eyes again. He turned away from them with a sigh.

"Nope," he said. "Much obliged. I'll send my man up to-morrow. Business keeps agoin' on just the same, no matter who passes out. If you or me died tonight, the whole world would just keep joggin' along. I'll send up."

They turned and walked out, feeling that anything they could say would be useless, and sound hollow, and they did not speak until they were some distance farther up the street.

"He's hard hit, poor cuss!" Bill said. "Wonder what the rest of it was. Let's go on up toward the High Light. Seems as if it must have been pretty bad. What's the commotion there?"

Ahead of them they saw men clustering toward a central point, and others who had been in the street hurrying forward to be absorbed into the group. They quickened their steps a trifle, speculating as to whether it could mean a brawl, or something relating to the disaster of which they had just learned. It proved the latter. A man was standing in the center of the gathering crowd with the reins of a tired horse hanging loosely over his arm. He was talking to the doctor, who was asking him questions.

Want the "After-Thought Stories"

The following two extracts are taken from letters in response to the announcement in the last issue in which we offered to furnish a beautifully printed copy of the best "After-Thought Stories" which have appeared during the last three or four years in The Missouri Farmer to all who send us one dollar to renew their subscription for three years:

A lady from Higginsville writes: "This is just what I have been looking for—for I admire "After-Thoughts" a great deal. I want to help out the good work you are doing for better and happier farm homes."

A reader from Houstonia writes: "I enjoy your paper very much and consider "After-Thoughts" gems of splendid worth."

And in the same vein have come responses from others. If you want to take advantage of this fine offer let us know at once.

The loss from Hog Cholera in Missouri amounts to $6,000,000 a year. That's why every farmer should have a copy of our splendid booklet entitled "Stamping Out Hog Cholera."

LIVE STOCK MISSOURI STATE FAIR

(Continued from page 11)

properly made junior champion and later was made grand champion. The class for senior sow pigs brought together twenty-eight cracking good young sows headed by the Wills entry—later made junior and grand champion over the good aged sow of Anderson's Eden Valley Queen.

Exhibitors—Alden Anderson, Story City, Iowa; Harry T. Crandall, Cass City, Mich.; C. R. Doty, Charleston, Ill.; Henry Fehner, Alma, Mo.; R. F. Fantz, New Hampton, Iowa; L. M. Feland, Tipton, Mo.; Kirby & Cloyd, Fayette, Mo.; J. T. Nunnelly, Readsville, Mo.; J. J. Wills, Platte City, Mo.; Whitten & Ballenger, McBaine, Mo.

Judge—J. H. Harvey, Maryville, Mo.

Aged boar—1, Wills on International Boy; 2, Crandall on School Master; 3, Anderson on Royal Commander.

Senior yearling boar—1, Wills on Gage's Leader; 2, Crandall on Abo 2nd; 3, Fantz on Elmo Chief 2nd.

Junior yearling boar—1, Anderson on Royal Good; 2, Doty on Major Domo; 3, Tehner on Scott Lea Alma Man.

Senior boar pig—1, Doty on Sudbury; 2, Anderson on Commander; 3, Wills on Missouri's Kind.

Junior boar pig—1, Nunnelly on unnamed entry; 2, Nunnelly on unnamed entry; 3, Crandall on Cracker Jack.

Aged sow—1 and 2, Anderson on Eden Valley Queen and Fancy Queen; 2, Doty on Lady March.

Senior year sow—1 and 2, Fantz on Fair Views Lady and Fair Views Best; 3, Doty on Doty's Queen.

Junior year sow—1 and 3, Wills on Perfection Girl and Easter Lily; 2, Anderson on Woodland Queen.

Senior sow pig—1 and 2, Wills on unnamed entries; 3, Anderson on Gilt Edge.

Junior sow pig—1, Nunnelly on unnamed entry; 2 and 3, Crandall on Cass Belle and Crandall's Perfection.

Senior champion boar—Wills on International Boy.

Junior champion boar—Doty on Sudbury.

Grand champion—Doty on Sudbury.

Senior champion sow—Anderson on Eden Valley Queen.

Junior champion sow—Wills on unnamed entry.

Grand champion sow—Wills on unnamed entry.

Aged herd—1, Anderson; 2, Wills.

Aged herd bred and owned by exhibitor—1, Doty; 2, Fantz.

Exhibitor's young herd—1, Wills; 2, Doty..

Breeder's young herd—1, Doty; 2, Crandall; 3, Fantz.

Get of sire—1, Wills; 2, Doty.

Produce of dam—1, Wills; 2, Doty.

The Hampshires

A better show of Hampshires has never been made at Sedalia than was furnished by one hundred and ten head this year. For the most part the judging met with general satisfaction but in several instances it was rather difficult to follow the judge.

C. J. Ward, who made his debut as an exhibitor, furnished a very attractive aged boar that had grand champion stamped all over him.

In the class for junior sow pigs the entry list was unusually large and as it was being judged darkness came on and compelled the postponement of this ring till the next morning. Here an unusual thing happened; the judge had pretty well sifted the top pigs out the night before, but when they were driven in the next day he left several of the ones he had picked the night before, out of his consideration.

Exhibitors—W. J. Briniger, Blythedale, Mo.; J. W. Heddins, Charleston, Ill.; Isom J. Martin, Lancaster, Mo.; T. A. Thornton, Mt. Moriah, Mo.; C. J. Ward, Cameron, Mo.; Tollie Wolf, Rockport, Mo.; Wickfield Farm, Cantril, Iowa; Mark Whitaker, Miami, Mo.; W. F. Yingst, State Center, Iowa.

Judge—Russell Yates, Paleo, Iowa.

Aged boar—1, Ward; 2, Brinigar; 3, Yingst.

Senior yearling boar—1 and 2, Brinigar.

Junior yearling boar—1, Brinigar; 2, Thornton; 3, Wickfield Farm.

Senior boar pig—1 and 3, Brinigar; 2, Wolf.

Junior boar pig—1, Thornton; 2, Martin; 3, Ward.

Aged sow—1, Brinigar; 2, Yingst; 3, Heddings.

Senior yearling sow—1, Ward; 2, Yingst; 3, Brinigar.

Junior yearling sow—1, Brinigar; 2, Wickfield Farm; 3, Yingst.

Senior sow pig—1, Brinigar; 2, Thornton; 3, Yingst.

Junior sow pig—1, Wickfield Farm; 2, Martin; 3, Wolf.

Senior champion boar—Ward.

Senior champion sow—Brinigar.

Junior champion boar—Brinigar.

Junior champion sow—Brinigar.

Grand champion boar—Ward.

Grand champion sow—Brinigar.

Aged herd owned by exhibitor—1, Brinigar; 2, Yingst.

Aged herd bred and owned by exhibitor —1, Brinigar; 2, Yingst.

Young herd owned by exhibitor—1, Brinigar; 2, Wickfield Farm.

Young herd bred and owned by exhibitor—1, Brinigar; 2, Wickfield Farm.

Get of sire—1, Brinigar; 2, Wickfield; 3, Martin.

Produce of sow—1, Brinigar; 2, Martin.

The Berkshires

Only two herds competed in the Berkshire rings and the Gentry entries had everything their own way save in the junior yearling boar class.

Exhibitors: S. Y. Burks, Bolivar, Mo.; N. H. Gentry, Sedalia, Mo.

Aged boars—Gentry.

Senior yearling boar—1 and 2, Gentry.

Junior yearling boar—1, Burks; 2, Gentry.

Senior boar pig—1, Burks; 2, Gentry.

Junior boar pig—1, Gentry; 2, Burks.

Aged sow—Gentry.

Senior yearling sow—1, 2 and 3, Gentry.

Junior yearling sow—1 and 2, Gentry.

Senior sow pig—1 and 3, Gentry; 2, Burks.

Junior sow pig—1, Burks.

Senior and grand champion boar—Gentry.

Senior and grand champion sow—Gentry.

Junior champion boar—Gentry.

Junior champion sow—Gentry.

Aged herd owned by exhibitor and aged herd bred by exhibitor—1 and 2, Gentry.

Young herd owned by exhibitor—1, Gentry; 2, Burks.

Young herd owned and bred by exhibitor—1, Gentry; 2, Burks.

Get of sire—1, Gentry; 2 Burks.

Produce of sow—1, Gentry; 2, Burks.

Berkshire Special, trophy for boar and three sows under 1 year—Gentry.

YORKSHIRES

Exhibitors: Dr. John Gildow & Son, Jamesport, Mo.; B. F. Davidson, Menlo, Iowa.

Judge—J. G. Fuller.

Aged boar—1 and 2, B. F. Davidson on Lake Park Fashion and Dandy Stuff.

Senior yearling boar—Davidson on Deer Creek.

Junior yearling boar—1, 2 and 3, Davidson on Deer Creek 2d, Deer Creek 3rd and Deer Creek High Class.

Senior boar pig—1, 2 and 3, Davidson on Davidson's Model 11th, 1th and 15th.

Junior boar pig—1 and 3, Davidson on Deer Creek High Class 2nd and Deer Creek High Class 3rd; 2, Gildow & Son on Gleanvarlock Baron.

Aged sow—1, 2 and 3, Davidson on Deer Creek Martha 5th, Topsy Queen 3rd, and Maypark Sunbeam.

Aged yearling sow—Davidson on Deer Creek Eleanor 2nd.

Junior yearling sow—1, 2 and 3, Davidson Classie Lass, Deer Creek Model and unnamed entry.

Senior sow pig—1 and 2, Davidson on Deer Creek Belle adn Wild Rose Belle.

Junior sow pig—1, 2 and 3, Davidson on Deer Creek Classie Lass 7th, Deer Creek Classie Lass 8th and Deer Creek Model.

Senior champion boar—Davidson.

Senior champion sow—Davidson.

Junior champion boar—Davidson.

Junior champion sow—Davidson.

Grand champion boar—Davidson.

Grand champion sow—Davidson.

Aged herd owned by exhibitor—Davidson 1 and 2.

Aged herd bred by exhibitor—Davidson, 1 and 2.

Young herd owned by exhibitor—Davidson, 1 and 2.

Young herd bred by exhibitor—Davidson, 1 and 2.

Four animals get of 1 sire—1 and 2, Davidson.

Produce of dam—1, Davidson; 2, Gildow & Sons.

The Duroc

While the number of Durocs was considerably less than a year ago, the quality of the show was in every way equal to the standard of last year. One hundred and seventy-five animals were passed upon in the various classes. Practically every class was well filled with top animals, especially were the junior pig classes well filled. In the aged boar class Sheley & Clatterbuck had rather easy going, and their good boar, S. & C's Valley Chief, was declared the winner. This boar was afterwards made senior and grand champion. In the sow classes championship honors were divided between Chas. L. Taylor and Dr. J. B. Unsell. The grand champion sow of last year was again on hand and won the aged sow class, but when the grand champion ribbon was handed out she was forced to abdicate in favor of the junior yearling from the same herd. This latter sow was every inch a grand champion and it is doubtful if a better sow has been shown at Missouri.

Exhibitors: Dr. W. P. Butler, Kahoka, Mo.; A. C. Brockman, Centralia, Mo.; W. H. Burks & Sons, Bolivar, Mo.; C. R. Doty, Charleston, Ill.; R. L. Hill, Columbia, Mo.; B. W. Harned, Beamen, Mo.; W. T. Hutchison, Cleveland, Mo.; Longview Farm, Lee's Summit, Mo.; McFarland Bros., Sedalia, Mo.; R. G. McDuff, Monroe, Ia.; J. W. McPherson, Columbia, Mo.; Shelly & Clatterbuck, New Bloomfield, Mo.; Charles L. Taylor, Olean, Mo.; Red, White and Blue Farm, Olean, Mo.; W. H. & Geo. E. Thomson, Columbia, Mo.; Dr. J. B. Unsell, Louisiana, Mo.

Judge—W. A. Williams, Marlow, Okla.

Aged boars—1, Sheley & Clatterbuck; 2, McFarland; 3, Longview Farm; 4, C. L. Taylor; 5, Harned; 6, Doty.

Senior yearling boar—1, Sheley & Clatterbuck; 2, McFarland; 3, McDuff.

Junior yearling boar—1, 2 and 4, C. L. Taylor; 3, Dowden & Partridge; 5, J. L. Taylor.

Senior boar pig—1, C. L. Taylor; 2, Sheley & Clatterbuck; 3, Longview Farm.

Junior boar pig—1, Unsell; 2, McFarland; 3, Thomson Bros.; 4, Hutchison; 5, C. L. Taylor; 6, McPherson.

Aged sow—C. L. Taylor; 2 and 3, Doty.

Senior yearling sow—1 and 2, Doty.

Junior yearling sow—1, 4 and 6, C. L. Taylor; 2 and 3, J. L. Taylor; 5, Harned.

Senior sow pig—1, 2 and 3, C. L. Taylor; 4, Doty.

Junior sow pig—1 and 3, Unsell; 2 and 4, Brockman; 5, Taylor; 6, McFarland.

Senior and grand champion boar—Sheley & Clatterbuck on S. & C's Valley Chief.

Junior champion boar—C. L. Taylor.

Senior and grand champion sow—C. L. Taylor on Col. Wonder's Dream.

Junior champion sow—Unsell.

Old herd owned by exhibitor—1, 2, C. L. Taylor.

Old herd bred and owned by exhibitor —1 and 2, C. L. Taylor.

Young herd owned by exhibitor—1, C. L. Taylor; 2, Unsell.

Young herd bred and owned by exhibitor—1, C. L. Taylor; 2, Unsell.

Get of sire—1 and 2, C. L. Taylor.

Produce of dam—1, Unsell; 2, C. L. Taylor.

American Association Special, young herd bred and owned by exhibitor—1, C. L. Taylor; 2, McFarland; 3, J. L. Taylor.

American Association Special, for Missouri breeders only, old herd bred and owned by exhibitor—1, C. L. Taylor; 2, J. L. Taylor.

American Association Special, for Missouri breeders only, young herd bred and owned by exhibitor—1, C. L. Taylor; 2, McFarland.

National Duroc Jersey Record Association Special, boar and 3 sows farrowed property of exhibitor—1, C. L. Taylor; 2, McFarland.

National Duroc Jersey Record Association Special, young herd bred by exhibitor—1, C. L. Taylor.

The First Duroc Futurity

This year the Missouri Duroc Jersey Swine Breeders' Association put on the first Duroc Futurity ever held and the pronounced success of the venture assures it becoming a regular event at the State Fair. There is no better way to stimulate the interest of new breeders to show than through a futurity. Ever since the association announced this feature interest has been very keen among old and new breeders and this interest never lagged until the last ribbon was tied. Dr. J. B. Unsell won the boar class with the very attractive pig which also won in the open class. Dr. W. P. Butler was given first place in the sow class and also the litter class. A point of considerable interest to young breeders should be the fact that this was the first State Fair show for both the above exhibitors. Prof. L. A. Weaver of the agricultural college judged the futurity and his placings were entirely satisfactory to the exhibitors.

Managed and guaranteed by Missouri Duroc Jersey Swine Breeders' Association, inc.

Judge—Prof. L. A. Weaver, Columbia, Mo.

Boar under six months—1, Unsell; 2, Thomson Bros.; 3, C. L. Taylor; 4, Hutchison; 5, Brockman; 6, Hill; 7, Butler; 8, McPherson.

Sow under six months—1, Butler; 2, Unsell; 3 and 7, Brockman; 4, Taylor; 5, Hill; 6, Thomson Bros.; 8, McPherson.

Litter of four—1, Butler; 2, Unsell; 3 and 8, C. L. Taylor; 4, Thomson Bros.; 5, Brockman; 6, Hill; 7, McPherson.

FREE WATCH!

Gurthet's Splendid Poland China Sale

On Friday, October 29th, J. B. Gurthet will sell at his farm adjoining Pattonsburg, Mo., a desirable offering of sixty head of strictly big type Poland Chinas. Mr. Gurthet has been engaged in producing pure-bred hogs for a number of years and the class of stuff he is producing has met with ready appreciation from careful buyers.

Mr. Gurthet has decided to cut down his herd and for that reason he is selling two of his herd boars. The older of these two boars, Long King's Equal 2nd, a two-year-old son of Long King's Equal out of an A. Wonder dam. This boar has been used in the herd etxensively and is being sold for no fault. He is an easy 950-pound boar, stands on a 10½-inch bone and is exceptionally good on his feet. The yearling boar, Model Wonder is by the noted sire, Big Bob, and is out of a Big Wonder dam. This boar was purchased in Seiver's record $107 boar sale.

The above boars would be attractive buys in any sale, but in this sale they are not alone among the good things cataloged. Eight tried sows of exceptional breeding and individuality are listed. Several will sell bred, and a few will sell with litters. Among the sows may be mentioned, Miss King, a grand daughter of Long King and out of a Jumbo Prospect dam; Long A. Wonder by A Wonder 47460, out of a Jumbo Prospect dam sells with a litter by Orange Wonder. She is a litter mate to the boar Mr. Gurthet sold for $250.

The fifteen fall gilts that will sell open are a very attractive lot and breeders who are planning to hold a bred sow sale this winter can pick some mighty nice sows from the lot. They have plenty of size and show unusual quality. Most of them are sired by Long King's Equal 2nd, and furnish striking proof of this boar's ability as a sire.

Nine spring boars sired by Brown's Big Orange, Long King's Equal 2d, Model Wonder and Orange Wonder will be just right for anyone needing a boar to use this fall. One of the boars by Orange Wonder out of a King of Wonder's dam is an outstanding pig. There also is a cracking good one by Long King's Equal 2d out of an A. Wonder sow. Eighteen spring gilts of the same breeding as the boars are good.

This sale is entitled to good support from breeders and farmers in the market for big type Polands with quality and we take pleasure in calling attention to it. Write at once for the catalog and arrange to attend the sale. Kindly mention this paper when you write.

Last Call for Goodspeed's Chester White Sale

Last week the writer visited the Goodspeed herd of Chester Whites and in company with several competent judges looked over the offering that will be sold Wednesday, November 3rd, at Maryville, Mo. It was the opinion of all that no sale will offer more size than Messrs. Goodspeed are putting on their first sale. March and April boars and gilts make up the entire offering, except the two older boars, Valley Prince and Harvest Lad. Fifty head will be sold and wil include thirty boars and twenty gilts. Most of the lot is sired by Sweepstakes Giant, the best two-year-old Chester White boar we know of in this state. He is sired by the champion Sweepstakes 28006, and is out of Goldie 3rd, by the 1200-pound Jumbo. Sweepstakes Giant weighed 905 pounds when shown at the Maryville Fair last month. Several litters by the Iowa champion, Wildwood Prince, show etxreme stretch and bone and one litter by Iowa First is hard to beat. The dams of the offering represent as good blood as the breed affords and in point of individuality make up one of the outstanding collections of brood sows owned in Missouri. The two older boars that were referred to above should prove attractive to any breeder in need of a herd boar. Valley Prince, a September yearling by Grubstake by Sweepstakes and out of Daisy by New York's Pride, is as good a boar as will be sold this year. The other boar, Harvest Lad, is by the great boar, International Boy, now at the head of J. J. Wills herd, and is out of a Jumbo 2d dam.

The offering is very uniform throughout and possesses sufficient merit to attract the best buyers. Everything is immune. The sale will be held in town. Write for catalog. R. P. Royce will attend the sale in the interest of The Missouri Farmer readers and will handle any bids our readers may care to send. Please mention this paper when you write.

Houchin's Hereford and Horse Sale

The attention of our readers is directed to the advertisement of the Houchin Stock Farm, in which it is announced that on Friday, October 22, a select lot of Hereford bulls and cows will be offered at public sale at the farm ten miles south of Sedalia, Mo., near Spring Fork. The offering will consist of 12 yearling bulls, 8 two-year-old bulls, 10 mature cows, 10 two-year-old heifers and 20 yearling heifers. Here is an excellent chance for our readers to purchase Hereford breeding stock at prices that will make money for the buyer. Every animal is registered, well bred, and the sort that the breeder and farmer like. In addition to the cattle, Mr. Houchin will sell a bunch of high-class horses and mules. Many of the young things are the get of the champion Astral King.

Terms will be very reasonable. Our readers can hardly afford to overlook this sale. Missourians have come to know that whenever Jas. A. Houchin offers live stock that it is right in every way.

Duroc Herd Boar For Sale

W. O. and B. A. Smith, Thompson, Mo., are offering a very unusual opportunity to any of our readers who are in the market for a herd boar. The boar in question is their well known young boar Beauty's Model 152503. Beauty's Model is sired by the three times champion Beauty's Model Top, which fact alone should make him attractive, but when it is stated that Beauty's Model was first prize senior yearling at the 1914 Missouri State Fair and that he had a lot of friends for grand championship honors, it is added prove of his merit. But the test of any herd boar is his ability as a sire and Beauty's Model has proven a very satisfactory sire in the Smith Bros.' herd.

In a recent letter from the senior member of this firm, he says that the only reason they are offering him for sale is because they want to keep a number of his daughters in their breeding herd.

Another good herd boar that they are offering is Beauty's Model Again, a yearling that they were planning to show this year. Both these boars are right in every particular and are sold on a guarantee that they are sure breeders. A number of choice spring boars by Beauty's Model are also in offer. Here is a rare chance to get a boar that will add prestige to your herd and we would suggest that any one interested visit the herd and see these boars. They are priced very reasonable.

When writing please mention The Missouri Farmer.

Peabody Shorthorns

Write June K. King & Sons, Marshall, Mo., for prices on the young Shorthorn bulls that they are now offering. These bulls are sired by a very thick-fleshed Scotch bull of great scale, and are out of Scotch topped cows, that are noted for their regular breeding and heavy milking qualities.

Willhoyte's Poland China Sale

O. J. Willhoyte, Maryville, Mo., announces elsewhere in this paper that on Thursday, October 21 he will offer at public sale sixty head of high-class Poland Chinas, consisting of tried sows, spring boars and gilts and one aged boar. This sale is dispersion of the herd, for the reason that Mr. Willhoyte has sold his farm and must give possession.

Among the sows offered are daughters of Big Wonder, Chief Wonder, Pawnee Pete, Longfellow King, Prince Tom and W's Big Sampson. This last named boar has been at the head of the herd and will be offered in the sale.

W's Big Sampson is a really good boar of the 1000-pound class. He is sired by Big Sampson and is out of Villisca Belle 2nd by Young Look. Villisca Belle 2nd

A. NO. 1 DUROC SPRING BOARS

I am offering a few extra choice spring boars sired by ILLUSTRATOR and out of TATTLETALE 39th, junior champion International 1913. A few by CRIMSON CHIEF AGAIN. Write or come.
W. C. WATSON. - - - - - - - NEW LONDON, MO.

Duroc Herd Headers For Sale

Beauty's Model 152503, 1st Prize Senior Yearling, Missouri State Fair, 1914, a sire of unusual merit, Beauty's Model Again, a junior yearling of much promise, sired by Beauty's Model and out of Top Col dam, and a good line of spring pigs. For particulars address W. O. & B. A. SMITH, Thompson, Mo.

RAMS

Chandler's Shropshires are reliable because they have the breeding and feeding to make them money-makers.
27 2-yr., many over 200 lbs., well wooled, blocky fellows, good enough for any breeder; your choice, $25.00.
14 2-yr., hardly so much covering, deep bodied, good fleece; your pick, $22.50.
17 yearlings (some by Big Butter Ram), mature better than 200.; $22.50 each.
Also a bunch at $18 and $20—all worth the money. Registered and crated light as possible.

RED POLLED

RED POLLED CATTLE

HERD ESTABLISHED 16 YEARS
Young stock for sale at all times.
Young bulls for sale sired by Logan 13500. The duel purpose kind.
M. L. Snyder, . Polo, Mo.

was considered one of the best brood sows in the Williams Bros.' herd.

W's Big Sampson is a half brother on the sire's side to W. E. Williams' Longfellow Sampson, and on the dam's side is a half brother to A. Marvel at the head of R. A. Schug's Nebraska herd. W's Big Sampson is in every way a desirable boar and should go to head a good herd. The young stuff is first-class in every respect. Our readers will not be disappointed if they attend the sale.

Linhardt's Good Poland China Bargains

H. O. Linhardt, Lohman, Mo., is prepared to furnish our readers with a very desirable lot of spring boars and gilts of strictly big type breeding and possessing a degree of quality not often found.

Mr. Linhardt has been producing this type of hogs for a number of years and the fact that he can refer you to satisfied buyers in twenty-three states is evidence aplenty that he has the goods to back up his offer. Spring boars and gilts by Governor Hadley, Giant Mammoth and Mammoth Wonder are now ready to sell at prices that should prove highly attractive to our readers. Mention this paper when you write.

Rauscher's Chester Whites

H. Rauscher & Son, Kakoha, Mo., who have one of the oldest herds of Chester Whites in the West, are offering some exceptionally good values in spring boars and gilts sired by Combination Giant, Missouri First, and other boars of note. Messrs. Rauscher sell on a guarantee of satisfaction, and price their stuff extremely reasonable. Mention this paper when you write.

Weller's Duroc Bargains

Parties wanting anything in the Duroc Jersey line should look up the ad of J. E. Weller, Faucett, Mo., who advertises a number of big strong yearling boars; also spring and summer boars any size from a 50-lb. weanling up. Since August 1st Mr. Weller has shipped to the following places: Chandler, Colo.; Hope, Ark.; Lake City, Ark.; Berryville, Ark.; Paola, Kan.; Bolivar, Mo.; Blairstown, Mo., Marquand, Mo. Bull calves have been shipped to Warsaw and Agency, Mo. Stock is being sold from the Weller herd over a wide territory and is giving good satisfaction. Just now a special price is being made on boars. While a number have been recently sold, the herd is large yet; over 200 head are on the farm—more pigs to be farrowed. The older ones must be kept moving in order to make room for the coming pigs. If in need of anything in the boar line write Mr. Weller and tell him what you want to buy and get his prices. One yearling and one six months old Shorthorn bull are offered. All the above stock is registered and of choicest breeding. More than 40 buyers have come back the second and third and some the fourth time and bought from this herd. This proves that satisfaction is given and that prices are decidedly reasonable. Before you buy better write J. E. Weller, Faucett, Mo., your wants.

Murry's Shorthorn Dispersion Sale

Having sold his famous Forest Grove Farm, Thos. F. Murry is forced to disperse his well-known herd of Shorthorn cattle, and on Friday, October 28, at the farm nine miles west of McCredie, fifteen miles northwest of Fulton, thirteen miles east of Columbia, and eighteen miles south of Centralia, sixty head of Shorthorn bulls and cows will be offered at public sale. This herd has been established over twenty years and during that time a very superior line of bulls have left their stamp on the breeding herd. At the forth-coming sale the fifty head of females will include a member with calves at foot, thirty that are bred to the good bull Rosewood Sultan 433758, and the balance bred to Orange Model 2nd 368980. Among the ten young bulls are several very superior herd bull prospects. All are good strong rugged fellows ready for hard service. Write at once for the catalog and kindly mention this paper.

A Splendid Boar for Sale or Trade

Look up the advertisement of M. D. Porter in which he offers to sell the good yearling boar Pawnee Price 2nd. This boar won first in his class in the open boar won second in his class in the open state fair. He is sired by Pawnee Price and is out of Jane Fawr. Mr. Porter will sell this boar reasonable or he will consider taking in a few well bred big type gilts. Other boars by Smooth Columbus, and Black Big Wonder are for sale. Mr. Porter brought out the grand champion at the state fair this year.

Lease & Son's Polands

Notice the new advertisement of O. G. Lease & Son, Centralia, Mo., in which they offer choice Poland China spring boars sired by Pfander's Big Ben. Messrs. Lease advise us that these boars will weigh around 175 pounds and that they are pricing them worth the money. They also have a nice lot of gilts that they offer either open or bred. Everything is guaranteed to be as represented. Messrs. Lease have one of the good herds of central Missouri. Mention this paper.

Martin's Hampshires

Notice the new advertisement of Isom J. Martin, Lancaster, Mo., in which he offers Hampshire spring boars and gilts sired by Gen. Tipton, and Sir Brookview his two grand champion herd boars. No Hampshire herd stands higher than the Brookview herd of Mr. Martin. Mention this paper.

Lockridge Has Grand Champion Boar

Will G. Lockridge of Fayette, Mo., who advertises Polands in this paper, showed the grand champion boar at the state fair last month. The Giant, was perhaps the most talked of boar on the grounds, on account of his unusual size, heavy bone and quality. Mr. Lockridge offers a few choice spring boars sired by the Giant, at prices that are sure to move them. To own a son of a grand champion is to place your herd in the lime light.

Important Boar Deal

Bennett Bros., Lee's Summit, Mo., are determined to own one of the top herds of Poland Chinas and when they paid $750 for a half interest in John Belcher's great boar, Smooth Columbus, they made a wise move. Smooth Columbus is regarded by many to be the best boar in the state, and among the best of the breed. It will be recalled that last year Smooth Columbus was champion at the Missouri State Fair, and that he was responsible for Mr. Belcher having the top sale of the state last year.

Bennett Bros. are offering a few extra good early spring boars sired by Smooth Columbus at prices extremely reasonable. Mention this paper.

Brookview Hampshires

Herd headed by GEN. TIPTON and SIR BROOKVIEW, both grand champions. Spring boars and gilts of choice breeding and individuality. Prices reasonable.

ISOM J. MARTIN R, 5 Lancaster, Mo.

CHESTER WHITES

RAUSCHER'S CHESTER WHITES!

Big, stretchy, heavy boned, March and April boars and gilts sired by Combination Giant, Mo. First and others. Pairs, trios or more. Prices reasonable and pigs must satisfy.

H. Rauscher & Son, Kahoka, Mo.

O.I.C.'s or Chester Whites

Express prepaid on O. I. C. and Chester White spring boars. Write for prices.

W. P. DOOLITTLE
WOODLAND, MARION CO., MO.

100 Prize-Winning O.I.C's

Our herd is headed by grand champion and champion boars of 1914 shows. Sows of equal merit. All backed by long line of prize winners. Early pigs, singles, pairs or more not akin, at rock bottom prices. We can please you. Write or come.

S. D. & B. H. FROST,
Box H Kingston, Mo.

A Tale of Dollars

The other day I chanced to get hold of a couple of silver dollars. The first one was coined in 1884 and looked almost as new as the day it left the mint. The other was coined in 1898—fourteen years later and was worn until the keen lettering of the dies was difficult, to read. As I turned them over in my hand I wished I might tempt them to tell me the story of their lives. Undoubtedly, the first one has had an easy time thus far. Perhaps it has been hidden away in some bank vault or has idled away its time in the "strong box" of a miser—while "Service" was written in unmistakable language all over the well-worn face of the other. While the first dollar was dodging responsibility, the latter was doing its full share in the never-ending struggles of life and I have no doubt if its mute lips could speak it could have told me of the many times it bought something to eat for the hungry, medicine for the sick, clothes for the poor and of a thousand other services which have made the World a better and happier place to live in.

And, as my mind was lost in speculative reverie the thought came to me, how similar is the silent story of these two coins to the lives of men? Here is a man who lives in comfort and ease. His hands have never been soiled or hardened through contact with the World's harsh work. Like the lily he toils not, neither does he spin. With him the one and only problem is to go through life with the least possible exertion. The serious problems of citizenship never disturb him. The thought of making the community or the World better has no place in his calculations. That there are those about him who are hungry or sick is plainly no affair of his. He lives selfishly unto and for himself and lets the balance of humanity shift as it will. Here is another—perhaps not so selfish—but merely shiftless and thriftless. He works only when stern necessity offers no other alternative. He is content with things as they are. He hates new ideas because of the energy necessary to master them. If he has a home it looks disheveled and neglected. He follows the "lines of least resistance" and like the first dollar, works only when driven to it.

But happily here and there are those who are living examples of the other dollar. Here is a business man who stands out like a mountain in the town in which he lives. He strives with might and main to succeed in business—but not at the expense of the community. On the contrary, he tries to pull everybody else up the ladder of success with him. He is the first man to back every good new enterprise with his enthusiasm and his money. When charity is needed his hand dives into his pocket. When somebody is "down and out" he is the first to give him a lift—and his greatest joy comes from rendering service. So too, here is a farmer who is "up and coming." He loves to make his citizenship count for good in his community. He is constantly on the alert for new ideas and delights in being progressive. He stands for good schools. He hates debt and shiftlessness and is constantly trying to plan a better way to do things—and as a result he is not only successful as success goes but his farm and his life are an inspiration to his neighbors. Like the last dollar, the word "Service" is stamped indelibly upon the personality of these men. Perhaps toil has made their figures somewhat stooped and worn but by the light in their eyes and the hope in their faces you can pick them out in any crowd. They value each fleeting hour and try to make the most of it. They regard life as a splendid opportunity—and to them to make "two blades grow where only one grew before" is a sacred command rather than a mere opportunity for profit. You and I, my friend, must, to a greater or less degree, take our places beside the first or the last dollar. Either we are making the World better or we are not—for a sharp line ever separates genuine service from mere selfish or aimless existence.

GRIND 150 BU. PER HOUR
LESS THAN 1¢ PER BUSHEL!

Bowsher Mills often reduce the cost of grinding one-half. That's because they are light running, with perfect conical shape grinders, different from all others.

BOWSHER FEED MILLS

(Sold with or without elevator)
Crush ear corn (with or without shucks) and **Grind** all kinds of small grain, cotton seed and **Head Kaffir.** Handy to operate. 10 sizes—2 to 25 H. P. Also sweep grinders.

FREE Send for folder on values of feeds and manures.

T.P. Bowsher Co., South Bend, Ind.

WATER DON'T BOIL IN GALLOWAY ENGINES

NO, SIR! The large water pot, ample cooling surface, heavy weight, large bore, low speed and long stroke type of engine with a perfectly water-cooled cylinder head **will not** boil over. 1916 improvements include new Galloway economy carburetor, valves in the head, built in magneto (extra), adjustable bearings. Costs little to operate and the new low prices speak for themselves. Do not compare Galloway engines to high-speeded, light weight, short lived engines that rack themselves to pieces in a season. My big 160 page four color catalog free. Engines shipped from Minneapolis, Council Bluffs, Chicago, Waterloo and Kansas City.

LYON'S PRACTICAL FARM PAPERS

I have judged farm products at our county fair nearly every year for twenty years, so it will be seen that I cannot exhibit, but I usually take two or three articles, "not in competition." This year it was a hanger with 16 extra fine ears of pure-bred seed corn, and a large bunch of nine-foot stalks of Sundan grass. I put a card on the corn, "For Sale, price, $1.00," and while one man offered me a dime for an ear I have the corn hanging up at home, worth $2.50. Another man wanted to trade me two dozen very fine potatoes, four varieties, for the corn, and that man could buy and sell me and have money left. Everybody agreed that my corn was by far the best at the fair, but when I told a party that in 1910 I paid $20 for two bushels of seed, 136 ears, I heard one man say, "If that is not a lie, that man is a fool."

One sees lots of funny things when judging. A man came up to me saying he had made four entries and had taken three first prizes—one on Leaming, one on large yellow, and one on the best ten ears, and thought that he should have had the prize on small yellow corn. We investigated and found his small yellow sample to consist of ears 9½ inches long, and he called that "small corn."

A woman came to ask me why her sugar trough gourds had not taken a prize? We went to the gourd department and found two mammoth Brazilian squashes with her entry tag on, marked, "two sugar trough gourds." She said that she had bought the seed for gourds, and so they must be gourds, but she collapsed when I asked her if she had bought 'em for strawberries, I was to consider these things berries?

The fruit judge came to me for assistance. He wanted to know if I knew Wealthy apples, and I told him that I did, but thought that he would not find any here as late as October 8. He said that it was left to me, so I went over and found three plates of monster Wolf River apples, entry cards marked "Wealthy." This was a clear case of three people skinned by a tree agent, who sold Wolf River for Wealthy. It was a poor year for pears here, and our fair has ten varieties on its premium list. They were all there, and all Kieffer too, as any fruit man knows it is no trouble to get a dozen shapes, sizes and colors of pears off one tree of Kieffers. The judge wanted to know what to do about it and I told him to taste 'em all. I met him the next day, and he said his mouth was sore from tasting only six samples.

At this writing, October 20, there is still much wheat seeding to do, and a good deal of corn to cut. We finished cutting 400 shocks of corn, 12x12 hills today, and a neighbor cut 75 on the shares. This leaves perhaps eight acres standing corn, and, as it is in good condition, we may cut more, for the high prices of hay will make a demand for fodder. Last year we sold fodder at 15 cents per shock and others nearer town got as high as 25 cents. Tobacco stripping is on, with the finest color seen in forty years, our own crops being said to have some of the best color ever seen, even by men of the widest tobacco experience. I handled every sample at the St. Louis World's Fair and did not see a single leaf of as fine color and texture as a good many "hands" of tobacco we stripped in my own barn yesterday, and we have not worked on our best yet. As for price, we have but one buyer, the merciless, conscienceless tobacco trust, and while this extra fancy tobacco ought to bring at least 50 cents per pound, we have no assurance that it will bring more than 20 cents. Well, tobacco will keep and if our best grades do not bring a good price, we will store them away, and let the low grades go over the markets.

There are bids of 50 cents a bushel for new corn, and few sellers, potatoes have gone up from 40 to 65 cents a bushel, but hogs are going down every day.

Every farmer in Missouri should have a copy of our great new booklet entitled "Stamping Out Hog Cholera." If you will send us a dollar at once we will mark up your subscription three years and send you a copy of this great book free.

"The Quality Goes IN Before the Name Goes ON"

Crown Combinola

'The Player of Many Tones'

THIS morning I bought some new music rolls and we now have a fine assortment—the latest dance music, popular ballads, marches, semiclassical and classical compositions—enough to please all. Grace can play for us, so that all can enjoy themselves."

You, too, can entertain royally with the Crown Combinola—play your own and your friends' favorite selections every night if you wish. The Crown Combinola brings into your home the finest music ever composed—places at your command the difficult compositions of the masters which few people ever learn to play. It is never out of practice, never too tired to play, never has to be coaxed; gives you all the music you want, of the kind you want, when you want it; and can be played by anyone, even a child.

And in addition to all piano music it faithfully reproduces the tones of the harp, zither, autoharp, harpsichord, clavichord, guitar, mandolin, banjo, and many other stringed instruments, placing a wide range of music at your command.

Your old piano taken in exchange at a liberal allowance. Estimates furnished FREE upon request and with no obligation on your part.

Learn more about this wonderful instrument which brings pleasure and happiness into your home. Our booklet "Music in the Home" explains in detail. Send for it today. Mail the coupon NOW.

Destroy Insects by Fall Plowing

If you want to kill the army worms, cutworms, Hessian flies, grasshoppers and other highly injurious insects, plow your fields this fall. Fall plowing, disking, and harrowing, within the next few weeks will break up the nests, cells and protecting cases of many insects and expose them to the rigors of winter weather. This will completely destroy many of our most injurious insects and greatly diminish the numbers of others.

Fall plowing does not affect all insects alike because they pass the winter in the soil in different stages. The grasshoppers and the corn root lice pass the winter in the egg stage; the cutworms, army worms, wire worms, and white grubs hibernate in the soil in the worm stage; the fall army worms, corn-ear worms, and garden web worms pass the winter in the pupa or resting stage; and the click beetles, May beetles and potato beetles hibernate in the soil as adult beetles.

Many insects are crushed and destroyed in their wintering stages by plowing and disking. Others are brought up nearer the surface and not being able to go deeper into the soil or to construct new cases are exposed to the ravages of birds and other animals. They are also subjected to excessive cold and moisture, to alternate freezing and thawing, and are killed.

Old wheat stubble fields full of volunteer wheat, weeds, and grass are now harboring Hessian flies, army worms, cutworms, grasshopper eggs, and plant lice, all of which may be destroyed by fall plowing. If these old stubble fields are not plowed until next spring serious injury may occur to corn, wheat, and other crops in the neighborhood. The Hessian flies, coming from the volunteer wheat next spring may completely destroy late sown wheat.

T. J. Talbert,
University of Missouri.

Does It Pay to Grind Feed for Lambs?

Experiments conducted at the Nebraska Experiment Station during the past winter indicate that the grinding of grain and alfalfa hay for lambs is not profitable under present conditions. While lambs fed a mixture of ground corn and ground alfalfa went on full feed quickly, cleaned up their feed each meal, and remained thrifty and vigorous throughout the entire feeding experiment, their increased weight was put on at a cost considerably higher than that of lambs fed shelled corn and whole alfalfa hay. The difference amounted to practically $1 on each 100 pounds gain. The same striking difference was noticeable in comparing lambs fed on ground corn, ground alfalfa, and corn silage and those fed shelled corn, whole alfalfa, and corn silage.

The Missouri Farmer

VOLUME VII NOVEMBER 1, 1915 NUMBER 21

Who Fixes The Price?

By Geo. B. Ellis, Managing Editor

When a bunch of packers can get heir heads together and break the rice of hogs more than a dollar a undred in two days as they did on October 20 and 21 something is rong, and radically wrong. Why did ll the great packing centers show the ig break of hog prices the same day? There was an increased run of hogs o begin with and shippers buying at he big centers began asking for conessions of five cents a hundred but ackers held off asking twenty cents r more. This seemed to be the signal, simultaneously given at all the ig markets, and in three days the rice of hogs was hammered down rom a dollar to a dollar and thirtyve cents a hundred and threats that he price must go lower. It matters ot that most of the corn these hogs ave eaten was worth 70 to 80 cents bushel and that upon any reasonable asis the farmer should have above ight cents a pound to get a living rofit—the fact is, the packers had it n their power to cut the price arbirarily and they cut it without cereony or apology to the hog raisers.

Loss $160,000 a Week

A friend of ours who was caught on e market during this break with two ads of hogs, figures his loss at $600. ne of the leading stock yard's dailies entions a shipper who pocketed a ss of $500 on one load of hogs. A ountry shipper of our acquaintance st $300 besides his time on a load hipped to the St. Louis market. To et some idea of what the loss was to Missouri let us present some figures hich tell their own story. We market pproximately 4,000,000 hogs a year om Missouri farms. Dividing this umber into equal weekly shipments e have nearly 80,000 hogs going to arket every week. A break of a ollar a hundred means a loss of at east $160,000 for the shippers who re on the market with hogs for the verage week during the year.

One bear factor used by the packers n hammering down prices was the confiscation of a few cargoes of meat some weeks ago by the British Government. We made editorial mention of this factor in the last issue of The Missouri Farmer but giving full allowance for the importance of this matter it is not strong enough to account for a legitimate break of one dollar to one dollar and thirty-five cents a hundred on live hogs within less than a week's time. Here is what one of the leading publications of the packers has to say about it:

"Traders attribute the sharp break in live hogs to late developments in the provision market. Considerable decline has been noted in the past few days on future quotations on mess pork, lard and ribs and without doubt this had a material bearing on the sudden reversal of form of the live pork market. IT IS ALSO POINTED OUT THAT THE OPENING OF THE WINTER PACKING SEASON IS LESS THAN 2 WEEKS OFF AND PACKERS ALWAYS MAKE A BEAR PLAY ABOUT THIS TIME. Prices are now nearly a dollar a hundred higher than a year ago. It is no secret that packers look for a heavy movement of hogs to market during November and the winter months when they figure that the spring pig crop, admittedly large, will be well along toward maturity. It is the general opinion that this expectancy of liberal supplies of hogs during the winter packing period has served to create heavy selling of future provisions, thus creating an unsettled condition in the hog market."

The above is typical of the packers' views. Do you note the significance of the sentence we have set in caps? Of course the packing season is near, we farmers know too well about that for we have too often been caught with the "bear play" they make about this time of year in regular order.

What seems to have been an inspired interview was published in the daily papers a short time ago holding that as we had a good corn crop this year it would in all probability sell for around 60 cents a bushel, farm delivery, and that ten pounds of pork being an average product of a bushel of corn the price of hogs should therefore be fixed at 6 cents for this winter. What do our readers think of that for price fixing? They are willing the farmer should have market prices for the corn he feeds to his hogs but they will not allow him anything for facing the winter storms to do his feeding or for risk of loss from disease which we all know is an important item of expense for hog raisers.

We have merely called attention to this break in hog prices—to this absolute fixing of prices by the concerted action of packers because it is recent and is now being discussed across partition fences in every neigbborhood in the state. The live question is, "What are we farmers going to do about it?"

While we are penning these lines the postman brings us a report of an organization of wheat raisers in western Kansas who have felt the strong hand of monopoly in fixing the price of wheat and here is what they propose to do by organizing a Kansas Wheat Growers' Union:

To fix the minimum price of wheat, based upon the average cost of production, estimated to be at least $1 a bushel, and to enforce this minimum price by concerted nondelivery.

To give the market for the first few months after harvest to those forced to sell and interest to those who store by a monthly increase in price of 2 cents a bushel, beginning with August each year.

To establish and maintain primary markets and sales agents through which to market their surplus wheat.

To establish a daily trade paper through which reliable information and expert advice relating to the production, care of and marketing wheat can be given the producers.

To provide representatives, when needed, to protect the interests of wheat growers in congress, legislatures, and before national and state commissions.

To secure the co-operation of all interests which will share in the prosperity resulting from a stable and increased price for wheat.

We are not presenting the above as our plan for the solution of this question but we are giving it to our readers as a basis for discussion.

This plan has been worked out by a committee of farmers who were appointed by a mass meeting of some 400 wheat growers who met to consider this matter. These farmers have seen wheat speculators and pork packers grow to be multi-millionaires while the men who produced the wheat and the hogs have found it difficult to pay the interest on the mortgage on the land they till. As a matter of fact, they have not all been able to do this, because the cold facts are that mortgage indebtedness on farm lands has increased and the number of farm tenants is greater than ten years ago.

Must Organize on Sound Basis

Wherever you may go the question of farm organization seems uppermost just now and if we avoid the mistakes of the past and get an organization of farmers on a sound enduring basis we must avoid impossible schemes in our plans. To what extent can or should farmers fix the prices for their products? In the first place is it possible for farmers to arbitrarily fix a price on wheat or hogs or the other products of the farm? In the second place is it desirable for their own welfare and the general good of all that they should do so? While we do not believe that it is possible for any farm organization to absolutely fix a minimum price for any product and under all circumstances to hold the price up to that point, yet we think by strong organized effort farmers can maintain a more stable market than under our present methods and stop the fixing of prices by the speculators and gamblers in food products. As an instance of how prices may be influenced we may cite the cotton prices last year and this year. Last year with a record-breaking crop of over 16,000,000 bales and the European market cut off on account of the war, cotton fell to a price that would bankrupt every grower in the country. But by co-operative efforts of planters, merchants, bankers, and the Government itself, living prices were restored within a few months and by the concerted action of planters in reducing the crop this year to 10,000,000 bales the threatened bankruptcy of the whole South has been averted. The cotton planter has learned that by holding back his cotton from the market and

If farmers see the need of organization why not organize now? Do you not think it is time for action? We have been talking long enough so let us get together in our own interests before our hands and feet are tied.

The packers knocked enough off the price of hogs in three days to keep a representative of Missouri farmers in all the big packing centers for three years. A loss of 10 cents a bushel on wheat, which loss is sometimes suffered in a day, means $100,000,000 on the 1915 wheat crop.

Too long we farmers have been content to plow, plant and reap and leave the buying of what we use and the selling of what we raise to others. Why not arouse ourselves to the great need of the hour and use the power of co-operation and organization to give us the fruits of our own labor.

The organization of farmers should begin right at home—in the school district where farmers know each other and where leaders and representatives can be chosen who can be trusted. Let the organization start work on something that will bring immediate results. Enough can be saved on buying a carload of fertilizer, lime, tankage, shipstuff, coal or other like products to make it worth while.

After a half dozen districts are organized and have found something to do a county club should be formed. And when half a dozen counties are organized a state federation should be perfected and the final aim should be a national union which under wise direction can become the great controlling force in the economic life of the farmers in every state in the Union. Such an organization can also be made a great social and educational movement.

Dear reader, are you ready to do your part? If you are send us a self-addressed stamped envelope and we will send you a thorough discussion and plan from this office.

by reducing the acreage he has held up the price of his principal crop and he has done more—he has devoted his idle acres to other crops which in many instances have proven more profitable than his old "stand-by" cotton.

Within the last few days wheat prices have been hammered down several cents a bushel. The bear influences largely responsible for the break were first the government estimate of a billion-bushel crop and second the expected rush of record-breaking shipments from the spring wheat country. We do not think the farmers acted unwisely in sowing a large acreage of wheat last season under the existing circumstances but they are now certainly doing just what the bears want them to do to hammer down the price of wheat—that is, try to rush it all to market at once. Suppose the wheat growers were joined together to the extent of even sixty or seventy per cent of all farmers raising wheat and there was maintained a farmer's agency in three or four of the big wheat markets of the country? Is it not reasonable to expect under this kind of organization and dissemination of market conditions that a great rush of wheat to market such as is now going on in the spring wheat belt could be averted? We do not believe it will be found necessary for farmers to establish great storage elevators to prevent a rush of wheat to market for the best and safest place for wheat storage when farmers learn how to handle it is in the bin right on the farm where the wheat is produced.

Organization to be effective must be general, that is it must include enough farmers who produce half or more of the crops or live stock produced. And then no organization can ever permanently succeed unless it is founded on the broad basis of agriculture and not on a single product. Farmers should join themselves together first by small units such as school districts or townships and these should then be joined in some form of county organization and finally in state and national bodies. The objects should be first, gaining information on any subject that will make the farmer's work more efficient or more profitable. The second object should be to find a better way to sell what we produce and to buy what we need.

The Missouri Farmer is trying to help the farmers work this out but we cannot do it alone—we must have your help. To any farmer who is interested to try to organize his own school district we will send a pamphlet discussing our plan of organization if he will send stamp for mailing.

SOYBEAN EXPERIENCE IN NORTH MISSOURI

Soybeans give promise of being one of the coming crops of Missouri. Their rather limited use so far is probably due to the fact that the farmers have not found out their real value. We have been growing cowpeas and soybeans in our corn for four years and we have found that the soybeans have given the better results. The varied seasons of the last few years, from very dry to the very wet past season, has made it possible to observe the behavior of these two plants under practically all conditions that one is likely to meet with. During the dry years the soybeans stood the dry weather much better than the cowpeas, producing more foliage and much more seed. This may be due to the hair-like covering over the leaves of the soybeans which holds the evaporation of the water from the plant in check. Yet in contrast to that during this wet season the soys stood the wet weather better. Practically all of the cowpeas having rotted before coming up or made very poor growth after getting started. On the well-drained land the cowpeas did almost as well as the soys but otherwise the soys were the best.

As we wanted to get an absolute test upon these two plants before giving up the cowpeas we planted every other row to the peas and the others with the soys. In this way we had the plants growing side by side under like conditions.

We grow the soybeans in the corn primarily for the fertility that they add to the soil. The soybean is a legume and like clover has the power of taking the nitrogen from the air and storing it up in the soil in a form that can be used by the following crops. On the roots there are nodules that are the homes of the bacteria that have the power of fixing the nitrogen. These bacteria are not usually present in the soil and artificial inoculation has to be resorted to. Artificial cultures of the bacteria are given away by the department of agriculture and give good results; at least they have with all that we have tried so far.

The question is often asked "do soybeans in the corn reduce the yield of the corn." There is no decrease in the yield of the corn so far as my observation goes. At the Experiment Station it was found that there was a slight increase in the yield where cowpeas or beans were planted along with the corn but only a very slight increase. The roots of the boybean, unlike those of the corn, go down deep. This downward growth of the roots loosens up the soil below the corn roots, making possible the quicker absorbtion of rainwater and at the same time the plant brings up its food from the deeper layers of soil where the roots of the grass plants like corn and wheat do not penetrate.

With us the cowpeas did well where the corn was thin and did not make much shade or where the ground was well drained and fertile. The soybeans on the other hand did better on the thin land and in the shade than the peas.

It is usually a good plan to fatten our hogs in the fall by turning them in the corn field and "Hog it down." As most every framer knows, corn alone does not make a balanced ration. It contains a very high per cent of starch and a very little protein. Starch will not build up muscle and bone, it must have protein along with it. Soybean seed has a high protein content and taken along with the corn balances up the ration. By experiment it has been found that when protein is added to a starchy feed that more of the starch is digested than when there is little protein present. This makes it possible for the pig to put on a maximum amount of flesh with less food.

We frequently turn the lambs in the field about the time the pods are beginning to ripen. The lambs will strip off the leaves and the pods and put on flesh more rapidly than on grass and will not bother the corn.

This year we went in the field with a wagon and cut quite a few soybeans for seed. They made 7 bushels to t acre. At $2.50 per bushel, which s the usual selling price, we have $17 per acre in addition to the corn cr which has not been affected, and al the nitrogen that has been stored in the soil. These facts, gathered fr our own experience have led us to t conclusion that we had better gr them in the corn hereafter. This m not hold true in the southern part the state but in the northern part am sure it will because soys c stand a cooler climate than can t peas.

We plant them with a cowpea attachment, putting three in a hill. T varieties that we have found to be t best are the Mongol and the Sab They mature earlier than most of t other varieties and produce the large amout of seed.

Aside from their value in the co they are good as a side crop. The feeding value is about equal to that alfalfa but they have one objection feature, that is their coarse sten This can be overcome a little thicker seeding. When seeding f grain we use the wheat drill, stoppi up the holes so that there is a r about every 27-28 inches apart. S about 1-1½ peck to the acre. A co planter may be used provided that t proper width can be gotten with it.

Roy L. Furry, Carroll County

Bell Telephone Exhibit, Panama-Pacific Exposition

A Wonder of Wonders

"It is the most beautiful and inspiring Exposition the world has ever seen."—*President Hadley of Yale, in speaking of the Panama-Pacific Exposition.*

EVERY American should feel it a duty as well as a privilege to visit the Panama-Pacific Exposition and view its never-equaled exhibits of achievements in Art, Science and Industry.

In all this assemblage of wonders, combining the highest accomplishments of creative genius and mechanical skill, there is none more wonderful than the exhibit of the Bell Telephone System.

Here, in a theatre de luxe, the welcome visitors sit at ease while the marvel of speech transmission is pictorially revealed and told in story. They listen to talk in New Yor three thousand miles awa they hear the roar of the su on the far-off Atlantic Coas they witness a demonstratio of Transcontinental telephon which has been awarded th Grand Prize of Electric Methods of Communicatio

This Transcontinental Li has taken the thought, lab and ingenuity of some of th greatest minds in the scienti world. Yet it is but a sm part of the more wonder universal service of the B System, which makes possib instant communication b tween all the people of t country.

ISSOURI SHOWING THE WORLD

Instead of following her prerogative f being shown, the state of Missouri as proven herself a "shower" of some ility by capturing the largest num- er of prizes in ribbons and cash

L. M. Monsees

wards for blooded jacks and jennets the recent Horse Show which pened the live stock events at the anama-Pacific International Exposi- on in San Francisco. In fact one an from Missouri, Louis Monsees of mithton, carried away all the prizes this department every prize winner eing Missouri bred and raised.

elle of The Grand Champion II 3796, Champion Jennet Panama Pacific International Exposition, 1915.

Belle of Limestone 513, Champion Jennet, St. Louis Exposition, 1904; mother of the 1915 Champion.

This is the second time that Mon- es and his sons, representative of issouri, have carried away highest nors for jacks and jennets. At the uisiana Purchase Exposition in St. uis in 1904, they were accorded all the highest honors. Many of the ize winners in San Francisco were ize winners in St. Louis and the re- ainder are offsprings of the St. Louis ampions.

Coming from Missouri, which has proven itself most generous of states, the Monsees aggregate of prizes doubled themselves for, at the beginning of the Exposition, the Missouri commissions pledged themselves to balance the exposition prize money with an equal sum for every prize won by Missouri exhibitors. In addition the state of Missouri, as an inducement for efficiency in live stock breeding, is paying fourteen dollars a head for every prize winner shipped from the state to the Exposition in San Francisco.

The total cash prizes awarded by the Exposition to the Monsees' stock was $1790, which was duplicated by the State of Missouri and plus $14 per capita for each prize winner and $173 bonus given by the Standard Jack Stock Association makes the Monsees' winnings come to $4949. This is the best showing made by an individual exhibitor in any class at the live stock show. It also means that Monsees & Sons captured 20 first prizes, 10 second prizes, 6 third prizes, 4 fourth prizes and 4 fifth prizes, 10 championships, 6 reserve championships, 2 grand championships and 4 reserve grand championships.

Monsees' rise in the live stock world has been due to an intimate study of his subject and persistent and steady work. He owned his first jack, Toby, when he was only twelve years old, having secured it for a pocket knife and four dollars in nickels. His first entrance into competition was at Chicago in 1893 when he won first premium on a jack called Superior Mammoth. He believes that it pays to use only the best animals for breeding purposes and to exhibit only the best animals that could be produced. This policy has won for him the reputation of the authority for the United States and Canada in this branch of stock raising. In 1905 he broke all world's records for a jack and jennet sale and in the succeeding years until 1910 he successively broke the records he had himself established. He is still endeavoring to accomplish greater results and to give people more for their money than has been done heretofore.

The results of Monsees' proficiency is to help advertise the great State of Missouri as the center of production for this class of stock. The reputation of Missouri for the production of jack stock and mules is unequalled by any other state, this having been attained only by patient and constant effort, conservative, honest dealing and a close study of the business.

st Prize Herd—Jack and three Jennets—Panama-Pacific International Exposition.

Radiators prolong summer!

Do you look forward to a winter of comfort, cheer and good health, or to a season of possible colds, chills and sickness, and sure discomfort for the whole family?

Why not have summer continue right on in your house, making every room "just fine" *all* over for the whole winter? By the turning of a valve you can have comfortable, even heat in every room with an outfit of

AMERICAN RADIATORS & IDEAL BOILERS

Find out at once all about AMERICAN Radiators and IDEAL Boilers from us or your local dealer. A million of the most successful homes in the country now have these money-saving and comfort-bringing outfits.

You and your family have to spend nearly eight months indoors and without IDEAL heating you have to endure the uneven, uncertain, old-fashioned heating with its ashes, coal-dust, soot and trouble, and it is no wonder that the family gets dissatisfied with farm life under these conditions. But with radiator heating the entire house becomes a haven of comfort and a delightful playground for the children and young folks.

Life on the farm beats city life, that's true, but it is only true when you have and enjoy the modern comforts and conveniences of proper heating and sanitation—radiator heating comes *first*.

IDEAL heating isn't a luxury any more—it is as necessary to the family as a good cook-stove. IDEAL-AMERICAN heating outfits cost less than you imagine and the investment is one that pays big dividends and saves fuel; no repairs, less labor, and hardly any caretaking. It repays you over 6% interest money on a bank loan made for installing an IDEAL Boiler and AMERICAN Radiators. Talk with your banker about it. He knows it is the best permanent value you could put into your property.

IDEAL-AMERICAN heating will delight your wife and will make an easy winter for all your family. IDEAL Boilers can be put in any building, either in cellar, side room or outhouse. One fire heats the whole house. The fuels used may be the cheapest soft coal screenings, lignite, pea coal, wood, oil or gas. Blizzards and strongest winds cannot keep the heat away from the nooks and corners of the home. In fact, the colder the weather the better the heat.

Running water or water mains are not necessary, as the water in the boiler is used over and over again for years. IDEAL-AMERICAN outfits give the same excellent service year after year as long as the building stands and OLD homes are equipped just as easily as new ones. Thousands of farm homes already have IDEAL Boilers and AMERICAN Radiators. You will probably find them in some of your neighbors' homes — ask them. Call up the local dealer and get him to submit an estimate. This will not obligate you in any way.

A No. 4-22-W IDEAL Boiler and 400 ft. of 38-in. AMERICAN Radiators, costing the owner $200, were used to heat this farm house. At this price the goods can be bought of any reputable, competent Fitter. This did not include cost of labor, pipe, valves, freight, etc., which vary according to climatic and other conditions.

IMPORTANT — In order that you may get all of the facts and a thorough explanation of these splendid heating outfits, we want you to send at once for a copy of our (free) book "Ideal Heating," 48-pages of important information, fully illustrated and beautifully printed. Sent free for your name and address.

AMERICAN Radiators and IDEAL Boilers change any house into a *home*.

Salt Required for Dairy Cows

An important item that is often overlooked in the management of the dairy herd is the necessity of providing salt in the ration of the cow. All animals that consume large quantities of vegetable food require salt. Babcock, of the Wisconsin Experiment Station, found in his experimental work that the cattle when deprived of salt, became emaciated and were of low vitality and finally suffered a complete breakdown. He recommended that they should be fed three-fourths of an ounce per day live weight with an additional 6-10 ounce for each 20 pounds of milk produced.

While salt may be provided in the daily ration by mixing it with the grain, an equally satisfactory method in practice is to keep it in a convenient place where the animals may have ready access to it when they so desire. It may be used in the form of rock salt or placed in boxes in the feed lot. However, it sould be borne in mind that salt is very essential to the economical handling and health of dairy cattle.

E. V. Ellington,
Idaho Experiment Station.

BUTCHERING TIME

The recent frosty nights remind us that the days of spare-ribs, chine, pork chops and good, old country sausage are about here and we think a timely discussion of the best and easiest methods of butchering and later the methods of curing and saving the meat given by the older members of our great family of readers will now be in order and perhaps of very great benefit to the young farmers who have not had much experience with this work. To start the discussion we give below some suggestions made by the Department of Agriculture:

A well-selected butchering outfit and a convenient place for working are important considerations at hog-killing time. To aid in this work demonstration specialists of the department suggest as a handy and complete "kit" consisting of two butcher knives, two "bell" or candlestick scrapers, a meat saw, and a sharpening steel. The meat saw is for sawing down the backbone and cutting up the carcass. The candlestick scrapers have detachable handles, and are used to remove the hair and scurf from the hogs. A long waterproof apron, which will protect the clothing, can be had at a small cost.

Preparation of Animals for Slaughter

A 24 to 36 hour fast, plenty of water, careful handling, and rest before slaughter are all important in securing meat in the best condition for use, either fresh or for curing purposes. Food in the stomach decomposes very rapidly after slaughter, and where the dressing is slow the gases generated often affect the flavor of the meat. Water should be given freely up to the time of slaughter, as it keeps the temperature normal.

It is highly important that the animals be not excited in any way sufficiently to raise the temperature of the body. If the animal becomes heated, it is better to allow it to rest overnight, before killing than to risk spoiling the meat. It is also essential that the hog be carefully handled so as not to bruise its body.

Points on Killing

It is customary on the farm to stun hogs before sticking them, although in some localities this is not done. Another method is by shooting the hog through the head with a rifle, although extraordinary care should be exercised in using a rifle around farm buildings. After stunning by a heavy blow on the center of the forehead immediately above the eyes with a poleax, the 8-inch straight-bladed knife is inserted into the hog's throat in the under portion of the neck, to a point just in front of the chest cavity, but not into this cavity. The knife is given a twist and sideward motion to sever the blood vessels and allow the blood to flow. By laying the hog on one side and elevating the ham end the blood will gravitate freely.

Proper Temperature of Water

A barrel is the receptacle commonly used for scalding. If it is set at the proper slant, with the open end against a table or platform of the proper height and the bottom securely fastened, there is little danger of accident. A strong table built for the purpose would be a very desirable thing on which to work, though it is not absolutely necessary. A box often serves very well. The water for scalding should be heated to the boiling point. This will allow for a reduction of temperature when the water is put into a cold barrel, the best temperature for scalding the hogs being from 145° to 150°. Be careful not to have the water so hot as to cook the skin of the hog. If the water is too hot the hair is likely to set. A small shovelful of hardwood ashes added to the water aids materially in removing the scurf from the body, though it has no effect in loosening the hair. A lump of lime, a handful of soft soap, a little pine tar, or a tablespoonful of concentrated lye has the same effect.

How to Scald a Hog

The hog should not be scalded before life is extinct, or the blood vessels near the surface of the skin will be cooked, giving a reddish tinge to the carcass. While being scalded the hog should be moved constantly to avoid cooking the skin. Occasionally it should be drawn out of the water to air—when the hair may be "tried." As soon as the hair and scurf slip easily from the surface, scalding is complete. If it is suspected that the water is too hot, scald the hind end of the hog first. If the water is too hot and you overscald the head, you will be adding to the trouble of scraping the part most difficult to clean. When the water is about right, begin by scalding the head.

The scraping and cleaning of the hog's skin should be done as soon as possible after removal of the animal from the scalding vat. Scraping a cold hog is a difficult, if not an impossible, task. Where it is necessary to reverse the position of the hog in the barrel to complete scalding, the portion scalded should be cleaned before attempting to scald the other end of the hog.

When the hair starts readily, remove the animal from the water and begin scraping. The "bell" scraper should be used with a long, sweeping movement over the sides and ends while the hog is still hot. The head and feet should be cleaned first, as they cool quickly. Pull the ears through the hands to remove the bulk of the hair. Grasp with the hands the lower portions of the legs and twist to assist in cleaning them. Use the "candlestick" scraper for removing the skin and scurf from the flat surfaces and as much as possible from the other parts and finish the cleaning of the entire carcass, removing all hair, scurf, and dirt by rinsing with hot water and shaving with the large knife.

Cut the skin on the side of the tendons below the hock to expose the tendons so that a gambrel stick may be inserted. The next step is to hang the hog high enough so that his head clears the ground. Wash down with hot water, shave over any unfinished patches and wash the entire carcass again to remove all loose hair and scurf.

Occasionally a hog is killed that is too large to scald in a barrel. If it is covered thickly with blankets or with sacks containing a little bran, and hot water poured over it, the hair will be loosened readily. In some localities hogs are skinned, but scalding is far more satisfactory.

Directions for Removing Entrails

In removing the entrails, first split the hog between the hind legs, separating the bones with the knife. This can easily be done if the cut is made directly through the union of bones between the hams. Run the knife down the center of the belly, shielding the point with the fingers of the left hand and guiding it with the right. There is little danger of cutting the intestines in this way. Split the breastbone with the knife or an ax and cut down through the sticking place to the chin. Cut around the rectum and pull it down until the kidneys are reached, using the knife wherever necessary to sever the cords attaching it to the "bed." Remove the sexual orgas, then cut across the artery running down the backbone, cut around the diaphragm (skirt) and remove the intestines, stomach, and "pluck," that is, heart, liver, and lungs, with a backward and downward pull—grasping the mass of organs near the union to the backbone and diaphragm, sever attachments with a knife where necessary. In this operation the windpipe down to the head should be removed with the pluck. Do not disturb the kidney or the leaf fat in carcasses to be shipped, except in warm weather, when the "leaf" may be removed to allow quicker and more thorough cooling. If the hog is to be cut up on the farm and not intended for shipment in carcass form, it is advisable to loosen the leaf fat from the abdominal wall, allowing it to remain attached to the carcass at the ham end. Open the jaw and insert a small block to allow free drainage; then wash out all blood with cold water and sponge out with a coarse cloth. In hot weather the backbone should be split to facilitate cooling. It is good practice to do this also where the hog is to be cut up on the farm and not intended for shipment. The fat should be removed from the intestines before they get cold. Since it is strong in flavor it should not be mixed with the leaf fat in rendering.

Editorial Note: In order to stimulate an interest in this subject the editor is going to offer a nice handy meat saw as a prize for the best article on the subject "Conveniences for and Methods of Butchering on the Farm." These articles to be received in this office not later than November 20. For all articles that are printed we will extend the time of subscription to The Missouri Farmer for one year. We hope a number of our readers who have found some convenience in butchering will write us on this subject and later we will offer another premium on the best methods of curing and canning meats. Don't forget it please but just write us at your earliest opportunity and don't hesitate because of spelling or punctuation—we will attend to that. Good ideas helpful to others are what we want.

International Feed Grinders

SPEND two cents a bushel—two cents—to grind feed with an **International** feed grinder. Then figure your profit on these items.

One-fourth of the grain fed to stock saved.
All the cob meal saved.
Hours of your time saved.
Steers and hogs ready for market in weeks less time.
More milk from cows.
More work from horses.

With your **International** feed grinder get a **Mogul** or **Titan** oil engine, operating on low grade kerosene. This economical power keeps down the cost of grinding and all other farm power work.

Type B **International** feed grinders are designed specially for grinding corn on the cob. There are three sizes, with 6", 8", and 10" plates. Type C is the small grain grinder, for oats, wheat, shelled corn, etc., and is made in 6" and 8" sizes. Type D is the heavy grinder for corn in the husk, Kaffir corn in the head, etc., and is made in 8" and 10" sizes.

Further information, covering every feature of **International** feed grinders and **I H C** oil engines, is contained in booklets which we will gladly send. Write for them.

SOME GOOD IN THE EXPERIMENT STATION

We sometimes hear farmers complaining that the experiment station and the College of Agriculture are of no benefit to them but this may be because these farmers have not called on the station or college for assistance. A good doctor never imposes his advice on a patient unless he is called upon and then he can help only through the willingness of the patient to take the medicine.

One of of our readers in Greene County, Mr. G. W. O'Bryant, says he has found the Missouri Agricultural College very helpful to him. "In the year 1912," he writes, "I bought 17 bushels of seed wheat from a farmer who had been co-operating with the agricultural college. Mr. Howard had been testing several varieties of wheat. The test showed the best results for the Fulcaster variety and it was this kind that I purchased. With the 17 bushels I sowed 15 acres in 1912 and I thrashed 427 buhsels after harvest in 1913 (about 28½ bushels per acre). The wheat tested 62 pounds per bushel. I sold the entire crop except my own seed to others for sowing. In 1913 I sowed 12 acres and threshed 340 bushels (28⅓ bushels per acre) and I sold that for seed. Then in 1914 I sowed 15 acres and threshed 280 bushels (18 2-3 bushels per acre) and this, too, was all sold for seed. I graded my seed every year and sowed nothing but plump grains and kept it free from rye, cockle, cheat, etc. I am ready to give the credit for this im

provement in my crop and my neighbors crops who bought of this seed, to the agricultural college, for it was responsible for making the trial and showing us that wheat can be improved."

The average yield of wheat for Mr. O'Bryant for the three years according to his statement is about 25 bushels per acre and that is about 10 above the average yield for the state. Mr. O'Bryant does not say how much he estimates the increased yield on account of the new seed, but if it were only two or three bushels per acre it has been a paying thing for him and his neighbors who are ready to accept a good thing when they see it.

WHEN TO VACCINATE AGAINST HOG CHOLERA

An infected herd should be vaccinated as soon as possible after recognition of the disease. Prompt treatment at the beginning of an outbreak in a herd will save most of the animals, while a few days' delay increases the percentage of loss. An early diagnosis is therefore important. The signs of the disease are sometimes so evident that the farmer recognizes the disease without expert aid. At other times the diagnosis is difficult, then the services of an expert should be secured. In the meantime the sanitary precaution—isolation and disinfection already recommended should be observed in order to prevent a possible disastrous spread of the disease.

The Veterinary Department of the College of Agriculture and Experiment Station will send an expert on request to investigate outbreaks of diseases of swine supposed to be cholera, and to instruct the owner of the herd and his neighbors how to protect their herds, and how to eradicate the infection. Where vaccination is necessary serum is provided by the University serum farm at cost of production, for the vaccination of infected and exposed herds. The judgment of the demonstrator sent from the Experiment Station should be relied upon, as to what hogs should be vaccinated and what should not be vaccinated. Otherwise disappointment and a waste of serum may result.

When vaccinating an infected herd, all hogs that are apparently sick should be separated from those that seem to be healthy, and the sick hogs should be isolated in comfortable quarters for special handling, and to prevent the spread of cholera infection.

Temperatures should be taken of the apparently healthy hogs and any of these that show an abnormal temperature should be separated from the others. The hogs that show no evidence of sickness should be vaccinated with the regulation dose of serum, or better, from a fourth to a half more serum than the regulation dose should be used if the disease is well developed in some of the other hogs of the herd. The group that shows an elevation of temperature, but no outward symptoms, should be vaccinated with a larger dose than that required for healthy swine of the same size—from a half to three-fourths the quantity should be added, this group should be kept separate from the others and put on a more restricted diet. The group of visibly sick hogs should have special handling; the animals that are evidently beyond all aid should be slaughtered and burned. Those that still eat should be put on a restricted liquid diet and should receive a double dose of serum. Valuable, pure-bred breeding animals have been saved in this way. Internal medication may also be given—according to the individual indications, but frequent and rough handling should be avoided.

As to whether the herd on adjoining farms should be vaccinated will depend upon the degree of exposure to the infection. If the herd on the adjoining farms is some distance away from the infected ones, and well isolated so that no communication with the infected farm is liable to occur, vaccination may not be necessary. Good breeders have frequently been able (before the days of vaccination) to isolate an infected show herd so that the home herd was not endangered. But the demonstrator who is sent to look into these matters will advise vaccination, if there is any special risk of the disease spreading to the neighboring herds. The proper sanitary measures mentioned in preceding articles if applied on the infected farms will lessen the dangers of the cholera infection spreading to the adjoining farms.

It is usually advisable to vaccinate the hogs on farms lying on the lower part of a stream if an outbreak of hog cholera has occured on a farm up the stream.

But if the outbreak is recent, the prompt removal of all the herd away from the stream may save both the hogs and a serum bill.

J. W. Connaway, D. V. S., M. D.,
Missouri Experiment Station.

A FARMER URGES CO-OPERATION

The Missouri Farmer:

I want to show my appreciation of your valued paper by writing, touching on a few things which I am sure are of interest to us Missouri farmers. You ask many questions from time to time pertaining to our welfare and I feel it is our duty to respond and let our brother farmers know what our needs are through the columns of The Missouri Farmer.

I believe a more thorough co-operation of farmers is the first great need. We should meet with other farmers oftener, discuss our needs and agree upon our wants, then stand together in demanding our rights. We should find a better plan to advertise our business and let people know what we have to sell as well as what we want to buy.

In regard to the Gardner Land Bank law, I think that conditions make such a law a necessity for the future welfare of farmers. Every man is entitled to a profit on his labor but with worn-out land and high rates of interest it is pretty hard for a great many of us to show any profit at the end of the year no matter how hard we work and try to make ends meet.

One trouble in getting good legislation is that we farmers have not been awake to our own interest and we have let politicians run things too much and our Legislature is made up mostly of lawyers and city politicians. We ought to have more level headed farmers in the Legislature and in Congress—good business men who look only to the public good and would not take all their time playing partisan politics. If we had a majority of farmers free from partisan influence in our Legislature it would be possible, for instance, to get a law that would exterminate the sheep-killing dogs and make it possible to develop the sheep business to a great industry in this state. It is not to our credit as intelligent farmers that we have about as many dogs as we have sheep in Missouri and that a number of hard working, honest farmers have been forced out of the sheep business because of the loss from these worthless dogs.

Another matter of importance is catching the tax dodger. A number of tax dodgers have been taught a good lesson here in Carroll County within the last two years. We have a circuit judge here in Ray and Carroll counties who believes every man should pay taxes on whatever property he owns and as a result of instruction to the grand jury nearly two years ago several hundred thousands of dollars have been added to our assessment lists and as a reminder these tax dodgers were fined as much as $200. Brother farmers, let us wake up and put such men in the Legislature and for county court judges, circuit judges and other responsible places, and we will soon see a different attitude towards the law and its enforcement. The farmer feeds the world but he has little to say in its government, but by more study, more open discussion and by better cooperation all this will be changed as it should.

I am not accustomed to writing for publication but I am in hearty accord with the views of The Missouri Farmer on the Land Bank measure, and on many other things including your stand on the necessity for farmers to co-operate for their own mutual interest in both selling and buying whenever that is practicable.

Sam D. Smarr, Carroll County.

Hundreds of cases of Hog Cholera are being reported all over the state—and you don't know when it will strike your neighborhood. For this reason you should get a copy of our great book on "Stamping Out Hog Cholera" at once. For one dollar we will mark your subscription up three years and send it to you free.

University Experts rate Economy Gasoline Engines with 13 to 31% Overload Capacity

Sears, Roebuck and Co.,
Chicago, Ill.

Urbana, Illinois,
August 28,1914.

Gentlemen:-

In accordance with your request, the undersigned visited your engine factory at Evansville, Indiana, and tested for brake horse power and fuel consumption the different sizes of your engines after same had been passed by your testing and inspection departments, and we submit a full report under separate cover.

In regard to the rating of these engines, while the relation of rated load to maximum load for gasoline engines has not been standardized, the best authorities seem to agree that an overload capacity of 15 percent is sufficient. We understand that you wish to give an overload capacity that cannot be questioned. We have therefore recommended the following ratings which will, in all but one case, give a much larger overload capacity as may be seen by referring to the table enclosed.

As to the fuel used, you will find on referring to our report that when running at half, full or maximum load the fuel consumption of the several engines was very satisfactory.

Yours very truly,

I. W. Dickerson
Associate Farm Power Machinery
University of Illinois.

H. F. Godeke
Instructor Mechanical Engineering
University of Illinois.

Report of University Experts

Bore and Stroke of Engines Tested	Maximum Brake Horse Power each Engine Pulled	The Horse Power Ratings We Recommend	Giving Each Engine an Overload Capacity of
3¼×5	1.69	1½	13%
4×6	3.28	2½	31%
5×7½	6.02	5	20%
5¾×9	8.66	7	23%
6½×11	11.44	9	27%

THE MISSOURI FARMER

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

Vol. VII November 1, 1915 No. 21

William Hirth - - - Publisher
Geo. B. Ellis - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year in Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct, always inclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

SHALL FARMERS ACT TOGETHER?

There is no disputing the fact that farmers are facing a crisis in the matter of getting and maintaining a free and unrestricted market for their products. For years we have been urging farmers to organize co-operative creameries because the history of these plants in Wisconsin and Minnesota proves that the co-operative creamery can make a better quality of butter than the centralized plant and therefore can pay a better price to farmers for cream. But these co-operative creameries have found that to compete with the big "trust owned" plants they must have a large part of the butter making business under co-operative control. Because of the unfair competition of the big centralized plants in this state the small privately owned plants and the co-operative plants are finding it pretty hard to make much progress. The methods pursued by the "trust" are about the same as the packers used to get control of local butchers a few years ago. Where they could not make terms with the local butcher they put him out of business or brought him to terms by selling meat so low that the local man could not meet the price without losing a lot of money and in this way they soon had the control of the dressed meat trade throughout the country. This is the reason why there is such a wide margin between the prices of beeves and hogs paid to farmers and the prices of dressed meats paid by city consumers.

There is not a town in this state where the prices of eggs and poultry are not fixed by the poultry trust. So they have us in their grip when we sell hogs, cattle, poultry, eggs, cream and butter. What are we going to produce to get loose from them? And suppose we did turn our attention to something else how long would it take them to get control of that too?

When farmers are urged to co-operate in these enterprises some of them say there is not enough in it to pay them. But here is one thing we fear a great many farmers have overlooked and that is the danger of too large capital invested in one man or in one corporation. Just as an example there are 277,384 farmers in Missouri and if we could suggest some co-operative venture that would net each farmer only $10 a year it would look too small to most of them to consider it very seriously. On the other hand if the trust can make this $10 off of every farmer's business it will have nearly $3,000,000 which becomes a powerful weapon in the hands of one corporation to control the business of the country.

The only hope we see for the future independence of farmers is for them to do just what the farmers of Minnesota and Wisconsin have been doing in a small way for several years and that is to stand together in co-operative organization.

DOES SUPPLY AND DEMAND GOVERN PRICES?

When the law of supply and demand fixes prices in a natural way no one should have a right to complain. But this does not mean that both producer and consumer are not interested in a business-like regulation or control of the supply of any product. If, for instance, there is an over-supply of apples and the fruit sells for a few years below a reasonable cost of production the danger is that many will neglect or destroy their orchards and the supply will fall below a reasonable demand and the same is true of any product of the farm. In order to maintain a regular supply of any product prices must be somewhat stable and high enough to give a reasonable profit to the producer.

The recent heavy break in hog prices caused by the concerted and what ought to be made a criminal action of the packers may prove a "boomerang" to them before the farmers are done with it. They may fool all the farmers some of the time and some of the farmers all of the time, but if we are not mistaken they will not be able to fool "all the farmers all of the time."

How long will the farmers of Missouri sit still and allow the packers to control the prices of their hogs and cattle, sheep, eggs, poultry and butter? Perhaps you have just never thought about it in that way, but that is just what they are doing. For many years the packer has been taking our profits from us and now he is using these millions to control the products of the farmers of other countries. The independence of the farmer and his natural disposition to go it alone has given the packer the chance.

Here is what a well known shipper from Knox County recently wrote to the St. Louis Live Stock Reporter:

"Have been a shipper of live stock for thirty years, but think last week's break the most severe that I ever went through even in time of a panic. Matters could not have been worse and I think it very unfair in the packer to take advantage of the country shipper and farmer and chop it off so fast.

"It is all right to adjust values, but it could be done in a way so as not to hurt anyone so badly, say ten cents a day for ten days would get off a dollar, which is much better than taking it off in two, or a better way would be to fix prices on Monday and these prices to hold good until Wednesday and Thursday of the following week as it takes a shipper three days to buy and get his hogs to market. Such weeks as last lost plenty of shippers as much as he can get back in six months and I feel that I am one of them and besides it stops business at home as no one can go out and buy the hogs for a few days until the prices stiffen up a little. Then they all get in ready for the next break.

"I for one believe as long as a "Mister Packer" has the right to fix the price on live stock and the selling price on dressed meats, he could pave the way and make it better for his patrons, as his profits depend on both the producer and the consumer as they look to him for a buyer. We need the packer as well as he does our stock and I believe things could be made more satisfactory all around."

LAND BANK PETITIONS ARE READY

The committee appointed some time ago to draft the form of Initiative Petition to be used in submitting the Land Bank Amendment to the voters at the next election has completed its task and any one who desires to aid in the cause by circulating a petition may have a blank by addressing The Missouri Farmer and making the request.

We regard the Lank Bank Bill as the most important measure that will come up for consideration in the near future and if farmers want a better system of rural credits established now is the time to act. If the measure should be defeated at this time it may take several years to get it before the voters again. A number of organizations have endorsed the Land Bank Bill but it is going to take some expense and a great deal of time to circulate these petitions and get the necessary number of signatures to place it on the ballot.

If any man thinks there is nothing wrong with conditions affecting home ownership in the rural districts he should take a little time to study statistics. In a majority of counties in the Corn Belt there was a decrease in the farm population during the last decade. During the same period there was an increase in the number and amount of farm mortgages and also an increase in the number of farms operated by tenants. Will any one try to maintain that any of these tendencies show a desirable condition of farm life?

The first object gained by the Land Bank Bill if it is approved by a vote of the people, should be to encourage home ownership and stop the increased tendency towards tenantry. The second benefit should be to enable farmers to put their lands in a better state of cultivation because with cheaper interest they can afford to drain and otherwise improve their farms. The stocking of farms with improved live stock should be encouraged by the establishment of this system. Many farmers could afford to establish dairy herds if they could get money at reasonable rates and on long time and surely no state is better suited to dairying than is Missouri.

WE HELP OURSELVES BY HELPING OTHERS

One of the finest traits of human character is that which causes us to want to extend a helping hand to our fellow man and there is no way that I know of that we can do so much good for so little effort as to give others the benefit of our experience in overcoming obstacles on the farm. The first aim of every farmer is to build a home where with a good wife and loving children he can enjoy the fruits of his daily labor. Fundamental to making the farm home what it should be and what we want it to be is "making the farm pay." If the farm does not pay we can not have a home filled with pictures and music and books. If the farm does not pay it is impossible to build good houses and supply them with those modern conveniences every good wife so much desires. If the farm does not pay the farmer can not have a commodious barn, labor-saving machinery, good fencing, fertile fields and well bred live stock. It takes money-making farms in every neighborhood to support good roads, ever green churches and the best improved schools.

Furthermore, I take it for granted that every good farmer would much prefer to live in a community where all the farmers are making the farm pay. And what is true of the home community in this respect is also true of the county, the state and the nation. We do not have in mind now those men who have grown rich by land speculation or by some chance "good luck" but the men we have in mind are those frugal, industrious citizens who by farming have paid for their farms, educated their boys and girls and have been of service to their communities.

There are thousands of such men in Missouri among our readers and I want to make this appeal to them to lend a helping hand to the young men who are starting now under much harder conditions for buying and paying for a farm home. The experiences which you have had helping you to own your home as well as the mistakes you have made which you can warn others to escape if told in a simple story in your own way may help many a struggling farmer to success.

I would like to fill the columns of The Missouri Farmer with these stories for the next six months and hope every farmer who reads this will write me at least a short story telling our readers of some of the things he has done which have helped to pay for and improve the farm—in other words the things which have made money and which he would recommend others to follow.

Some time ago a sturdy Missouri farmer gave in our columns the story of how he had bought a worn-out farm thirty-four years ago—bought it all on time, has raised and educated a large family and has the farm paid for. Another bought a small farm nearly all on time. The farm was considered worn out fourteen years ago, he has built up the land and improved the farm and in spite of the fact that within that time, 1901 to now, we have had four extremely dry and unprofitable years, this man, too, has the farm practically paid for.

Now, friends, write us your story, and do not wait for any further invitation. The Missouri Farmer wants to help its readers make more money that they may build better homes, and if we can get your experience for them we know it will help them. Right here is a good plan to foster the spirit of co-operation and organization we are just now talking so much about and which would revolutionize farm methods and better yet farm profits if our readers would join with us in our efforts to bring about "better farming," "better farm homes" and "better citizenship" in Missouri.

This appeal is made to both men and women for we know on thousands of farms the success has been due as much to the work and good management of the women as to the men. Help us arouse the spirit of better and more profitable farming in this great old state of Missouri.

MOST IMPORTANT PROBLEM

Mapleton Stock Farm,
Fulton, Mo., Oct. 18, '15

The Missouri Farmer:

Replying to your letter of late date, we have carefully read your pamphlet "What's the Matter With the Farm," and we assure you that you have our hearty and sincere co-operation in the plans therein expressed. We think the farm problem one of the most important issues before the world today and the most neglected. We are ready to take off our hats, unbutton our collars, roll up our sleeves and push the work until every school district in the state is organized. Will gladly give to this worthy enterprise all the help we possibly can.

Womack Bros.

BUCKSHOT BY THE PROFESSOR

"Nice Old Elephant," "Pretty Old Elephant"—this is what "Teddy" is saying out loud in his dreams these nights.

Well, now that old Carranza has been "recognized," I hope he'll go and get a hair cut and a shave and keep his infernal mouth shut.

"Bill" Bryan's sure having tough luck. Here's Woodrow Wilson getting kissed by pretty young women—and the best poor old Bill can do is to get kissed by a Kansas farmer with a face all mussed up with bushy whiskers.

Just the same, even if we haven't got a big standing army and a great big navy, if anybody ever undertakes to "invade" the U. S. A. the undertakers and the Red Cross societies will do a landoffice business—and don't you forget it!

The gang down in front of "Hez" Brown's store was in mighty high spirits last week. They quit discussing the "furrin war" long enough to rejoice over the fact that "wimmins suffrage was beat to a frazzle in New Jersey."

If every farmer who reads this paper knew what a fine and valuable book "Stamping Out Hog Cholera" was he'd want a copy of it on the first mail. They'll mark your subscription up for three years and send you a copy of it free for a dollar.

Has it ever occurred to you that your district school should teach the primary secrets of soils, plants and animals to your boys if they are to make good farmers in the future and if they are to be taught to love farm life—and can we expect this kind of instruction at the hands of an immature $40 per month teacher?

Just so long as farmers don't organize and co-operate with each other—just so long will the farmer be cuffed and kicked around by those who buy his live stock and his other farm products. I am not advocating a "Farmers' Trust"—but it is high time farmers were receiving something near what intelligent production costs for the things that feed the World.

Old "Josh" Simpson had a "powerful" scare the other night. "Josh" had caught a 'possum and tied it up in an old gunny sack. Then he concluded to take a snooze in the office down at the Livery Stable—so he pitched the sack over in one corner. By and by something made a noise and waked old "Josh" up and rubbing his eyes he saw the sack moving around on the floor—and thinking he "had em" he gave the rebel yell for fair.

The packers set the price on the farmers' cattle, hogs and sheep and the commission firms set the price for selling them—but nobody asks any questions or worries about what it costs the farmer to produce them. However, it's a long road that has no turn—and so a day of reckoning is slowly but surely approaching. Once farmers get together and organize for their mutual protection somebody will wonder who it was who "struck Billy Patterson."

Soon the farmer will be sallying forth in the frosty morning air to pluck the golden ears—and, come to think of it, there are a pile of tasks more unpleasant in this World than "shuckin" corn. It's a little rough on the hands until they get hardened—but from that time on it's real fun to make the big ears hit the "throw board" with a regularity which ceases only when the sun sinks behind the western hills.

There are a pile of reasons why I pity the fellow who was raised in the city—and among them is the fact that as a boy he never knew the fun of hunting coons and 'possums and setting traps for other kinds of "varmints." There are silent tongues in every woodland and along every slough which speak only to those who learned to know them in the boyhood days of yesterday and it is therefore little wonder that most of the Nation's big and broad men come from the farms—for it is out in the fields and among the wooded hills and valleys that great souls grow. It was by the side of babbling brooks, amid cliffs and out upon the trackless prairies that the beautiful legends and sentiment of the American Indian was instilled into his savage being—a legendry and romance which is as beautiful as any the World has ever known.

Where Organization Would Help

Editor The Missouri Farmer:

I notice in your paper where you had helped some farmers out with their apple proposition and wondered if you could help some of us out with a dairy deal. Speaking for myself, I have a pit silo and have filled it. Have feed for at least five more cows than I have. The bank here informs me that they have no money to loan for the purpose of buying dairy cows. As dairying is a new business here there is a scarcity of good dairy cows and it is impossible to buy any stock. I have talked with several others who want more cows, some have the money to buy them and some, like myself, wish to secure them on time, long enough time so that they can pay out. What we need is some one to ship in a carload of good grade stock, nothing fancy or high priced, but good enough to pay for their board. Party shipping should be fixed so that he could take good notes for at least part of the car. If you know of some one who could help me out would be very glad to hear from them. My farm is 1¼ miles from town and if they ship a car here they can use my place as headquarters and pasture here until sold.

Have been receiving your paper for some time and like it very much. Like your stand on the "Hound Dog" question, the Gardiner Land Bank Bill and several others. Don't know what friend sent paper to me or how long it is coming, but I will enclose a dollar so you may extend my time.

Oregon County Farmer.

BOYS AT THE STATE FAIR

This year I was enrolled at the Boys' State Fair School and I was requested to write about my trip. I started for Sedalia on Sunday noon and arrived there about 4:20 that afternoon. On the way I saw many farms with improved homes, silos and big barns were seen very often. There were poor farms also, but they will be improved if the coming generation will take heed to the Experimet Stations, Agricultural Colleges and Agricultural Fairs and lectures by men who know what they are talking about.

Some of the land was rocky and hilly and these are suited to other kinds of industry. We finally arrived at the station. We waited awhile and then boarded a street car for the fair grounds. I met several other boys before reaching the ground. All of us were wearing badges which made it easy for any one to recognize us. We signed our names at the gate and with instructions from the gentlemen we entered the fair grounds, which was to be our school for the week.

The camp was situated on the north part of the grounds, a little to one side of the business part of the fair. There were many tents for us to camp in and a large one for the lectures, judging and demonstrations.

The Superintendent of the Boys' State Fair School was T. J. Walker of Jefferson City. I think I can say that all of the boys thought a great deal of him, because he took good care of us as far as he could and had us do what was right. His assistant, Mr. Sipple of the Kirksville Normal was also interested in us. He made an instructive talk on the care of ourselves and camp.

One of the lecturers was Col. W. A. Dallmeyer, president of the State Fair Board. His talk was an "Address of Welcome." Pres. P. P. Lewis of the State Board of Agriculture gave several good pointers on the Holstine dairy cow His talk was very interesting. Mr. C. T. Patterson, State Pathologist, State Poultry Experiment Station, lectured on poultry. His explanations were a great help. The corn man, S. M. Jordan, who is state lecturer for the Board of Agriculture, made several good hits on corn, alfalfa, weeds ad others subjects of interest. Demonstration of "Test for Soil Acidity," was given by Prof. L. F. Childers of the College of Agriculture. Mr. Houchin and Mr. Barnes talked on interesting subjects. J. Kelly Wright, institute lecturer, gave good information to us young farmers especially on silos. Prof. Howard A. Gass, State Superintendent of Schools, and Jas. C. Heisey, gave some good information. An address was given by Mr. G. W. Revis, boys' and girls' club director. He was in favor of the girls being among the next ones to go to the fair school. W. D. McKee told us about alfalfa and I wish more could have heard his lecture. Messrs. S. T. Simpson of Columbia and P. B. Barker of boys' corn judging contest were others who gave an address.

Mr. Cory, graduate of Princeton College, gave an address on concrete work, silos, good roads, etc. Several talks were given on home economics and farm life, legume crops, fertilizers and other things. I think this list of men includes most of the spreakers and lecturers.

In the morning we would attend these lectures and in the afternoon we would find the many places of interest. In the evening we would attend the horse shows in the stock pavillion. We saw the tractor plowing contest and it was something not to be forgotten soon. There was a corn judging and stock judging contest for us boys. There was also a cyphering and corn stringing contest for the boys and chicken dressing contest for the girls in the John Deere building. Ribbons were awarded to 1st, 2nd and 3rd pupils. The University building was a great educational building.

There were so many important things to tell that I'm afraid I'll take too much space in the paper. This is a great trip for any boy or girl and he should try to take advantage of it and put into practice some of the good and helpful advice.

Bee Croswhite,
Age 15. Audrain County.

Your Profit

—From Firestone Good-Measure Building

WHEN you invest in Firestone Tires you draw immediate profit from the Firestone standards of good-measure building and the tremendous volume of output required to meet Firestone demand. Firestone has long been the largest exclusive tire and rim builder. Yet the Firestone demand brought us 50% more dealers last year and increased our output 78%.

This volume—and our transcontinental distributing system—make it possible to supply you Firestone Tires with their maximum values at popular prices.

From Firestone Specialized Science you also gain "Most Miles per Dollar"—supreme riding comfort—unusually long service—safety.

Send us the name of your dealer and the name and make of your tires and we will send you one

Cementless Tube Patch FREE

Also our new book of tire saving helps No. 41 entitled "Mileage Talks."

MY SPREADER LASTS A LIFETIME

SPREADERS AND BOXES $39.50 $52.50 $64.75 $76.50 $82.50

No farm implement pays for itself so many times over as the Genuine Galloway Low Down Spreader. Pays big dividends when used any time of the year. My new Low Down No. 8 with heavy channel steel frame, trussed like a steel bridge, double chain drive, flexible rake and low down beater is sold on 30 days' trial and guaranteed to please you better than any spreader on the market. Its honest construction, simplicity, eleven spreader improvements and low price (because it is made and sold direct to you with only one small profit added) make it popular in every neighborhood. Big new four-color special catalog free. Spreaders shipped from Minneapolis, Kansas City, Council Bluffs, Chicago or Waterloo.

WM. GALLOWAY CO., BOX 599 WATERLOO, IOWA

The Plunderer

By ROY NORTON

Author of "The Garden of Fate"

(Continued from last issue)

"No," Bill and Dick heard him say as they crowded into the group, "there ain't nothin' you can do, Doc. It's all over with 'em. I was there until quite late. God! It's awful!"

"Anybody get out at all?" someone asked.

"No. That's a cinch. You see they were driving back in and feeling for the ledge. Blocking out, I think. Pretty lean ore, over there, you know. So there was just one drift away from the shaft, and and it was in that she caved."

There was a moment's silence and then a half-dozen questions asked almost in the same moment. The man turned first to one and then to another as if striving to decide which query should be answered first, and shook his head hopelessly.

"They didn't have a chance," he asserted. "It happened three days ago, as you all know. They sent over to Arrapahoe and all the boys over there went and volunteered. They worked just as many men as could get into the drift at a time, and they spelled each other in half-hour shifts, so's every man could do his best. They hadn't got in twenty feet before they saw that she was bad. Seemed as if the whole drift had been wiped out. It was as solid as rock in places—just as if the whole mountain had slipped!"

"Did you go down, Jim?" the doctor asked.

For reply the man held up his hands. Dick, close behind him and peering forward to see them in the light that came from a street lamp, saw they were a mass of blisters with the skin torn away, red and bleeding. The answer was too eloquent to require words for the man they called Jim had evidently been there and striving madly, as had others, in the attempt to rescue. There was a surge forward as the crowd pressed in, each man trying to inspect these evidences of the tragedy. The questions were coming faster and from all sides. Most frequently the anxious demand, coupled with a pronounced eagerness was, "Is there anything any of us can do? Can we help if we get over there?"

"How far over is it?" Bill asked the man nearest him.

"Forty-miles," was the answer. They were all willing to travel that far, or farther, if they could be of any assistance whatever.

"No, there's no use in going," the man in the center said. "There's more there now than can be handled, and all they're doing is to try to get at the boys' bodies. It's sure that they can't live till they're taken out. You all know that! They're gone, every one of 'em. And that ain't the worst. They left twenty-six widows most of 'em with children!"

A groan went up from the crowd. The word passed back along like the waves cast up by a rock thrown into the center of a pool of blackness. It began at the center with its repetition as the words were conveyed to those out of earshot. "He says there's twenty-six widows. He says there's a lot of children."

The questions were flowing inward again.

"No, boys, there ain't a thing you can do," the man they called Jim repeated. "That is, there ain't a thing can be done for the boys underground. They're gone; but somebody ought to do what can be done for them that's left. It's money that helps the most. That's the best way to show that most all of us had friends who went out."

He turned and climbed back into his saddle in the little open space, and there was another moment's silence. The crowd looked up at him now, as he sat there in the center of the light thrown downward, feebly, from the lamp.

"Give me room, boys, won't you?" he asked. "My cayuse is about all in. There ain't nothing more to tell. There ain't a thing you can do; but just what I said. Those women and children will need money. They're all broke."

The crowd slowly parted and he rode through a narrow lane where his stirrups brushed against those in the front ranks, and then the gathering began to twist backward and forward, to disintegrate, to spread itself outward and up the street of the camp. It talked in a subdued way as it went. There were but few in it who did not know and picture the meaning of all that had been imparted by the courier—the desperate alarm, the haggard, sobbing women in front of a hoist, the relays of men who were ready to descend and beat hammer on steel and tear madly at slow-yielding rock, the calls for a rest while carpenters hastily propped up tottering roofs and walls, the occasional warning shouts when men fell back to watch other huge masses of rock fall into the black drift, and the instants when some rescuer, overwrought, thought he heard sounds of "rock telegraphing" and bade the others pause and listen. There were those among the men on the street who had seen the desperate, melancholy conclusions, when hope, flaming ever more feebly, guttered out as a burned candle and died. There were those among them who had been in those black holes of despair and been rescued, to carry scars of the body for life, but recklessly forget the scars of the mind, the horrors of despair. Comparative strangers to the camp as were the two men of the Cross, they appreciated the full meaning of the blow; for doubtless there was scarcely a man around them who had not known some of those who perished in that terrible, lingering agony. Besides they were miners all.

"Pretty tough luck, isn't it?"

They found themselves confronted by the doctor, who had turned at the sound of their voices as they resumed conversation.

"We just learned of it," Dick answered, "and know scarcely anything whatever of it, save what we just heard."

The doctor shook his head.

"It has been almost the sole topic here for the last two days," he said. "We heard of it after it was too late for any of us to be of use. I started over, but got word from a conferre of mine from a camp farther east, that there were already four doctors on the spot and that I need not come unless they called for me. Even then they were hopeless. Most of the men of the Blackbird were good men, too. The kind that have families, and are steady; but I suppose from what I hear they were nearly all fellows who have been idle for some time, or have just moved into the district, so probably they had nothing much to leave in the way of support—for those left behind.

He stopped for a moment and peered at other men who were passing them.

"I think it my duty to do something in that regard," he said, quietly. "I believe I shall get Mrs. Meredith to call a meeting out in front of her place. Nearly every man of the camp goes there at some time or another, in the course of the evening. Perhaps I could—"

Again he stopped, as if thinking of the best plan.

"I see," interpolated the miner, almost as his younger companion was about to offer the same suggestion. "Let her send out word that every man in the camp is wanted. Then you give them the last news and get them to do what they can. That's right."

"It is the best way," asserted Dick, agreeing with the project. "You can do more than any one. They all respect and know you."

They left him to make his way toward the High Light and stood at the borders of little gatherings on the street, gleaning other details of the tragedy, for nearly an hour, and then were attracted by a sound below them. Men were calling to one another. Out in front of the High Light two torches flared, their flames glowing steadily in the still night air and lighting the faces of those who gathered toward them. They went with the street current and again found themselves in a crowd; but it was not so dense as that first one they had encountered. Men stood in groups, thoughtfully, with hands in pockets, their harsh, strong faces rendered soft by the light. They talked together with a quiet and sad sympathy, as if in that hour they were all of one family up there in the heart of the mountains from which they tore their hard livelihood. There was a stir from the nearest store and a voice called, "Here, Doc! Here's a couple of boxes for you to stand on so they can see you when you talk."

Men were carrying some large packing cases, or tumbling them end over end, with hollow, booming noises, to form a crude platform. The boxes clashed together. Two men holding the torches climbed up on them and they saw two others boosting the doctor upward. At sight of him there was a restraining hiss passed round through the gathering crowd, commanding silence. He waited for it to become complete.

"Men," he said, "you have all heard the news. Thirty-three of our fellows died over across the divide, or are dying now. God knows which! God grant they went quickly!"

He stopped and although not a trained orator, the pause could have been no more effective. Dick looked around him. The faces of those nearest were grave and unmoved, as if carved from the mother rock of the country in which they delved; but he saw a light in their frowning eyes that told how deeply their sympathies were stirred.

"I didn't get up here to talk to you so much about them, however," the doctor went on, quietly, "as I did to remind you that out of thirty-three of these men there were twenty-six who left widows, or widows and children behind them. The boys over there did all they could. There were a hundred and fifty men who tried to save them. They are now working mererly to get their bodies. We couldn't be there to help in that; so we do what we can here. And that doing shall consist in helping out those women and children. There's a box down here in front of me. I wish you'd put what you can on it."

Bill, staring over the heads of those around him, saw a movement among those nearest the orator's stand, and into the ring of light stepped The Lily. Apparently she was speaking to the doctor, who leaned down to listen. He straightened up and called for silence.

"Mrs. Meredith," he said, "says that any man here who has no money with him can sign what he wants to give on a piece of paper, and that she will accept it as she would a pay-check and forward the cash. Then on payday the man can come and redeem his paper pledge."

There was a low murmur of approval swept round over the crowd which began to move forward with slow regularity. The doctor dropped down from his rostrum as if his task were done. The torches lowered as their bearers followed him and planted them beside the box on which coins, big round silver dollars and yellow gold-pieces, were falling, with here and there a scrap of paper. No one stood guard over that collection. The crowd was thinning out. Dick turned toward his friend and looked up at him to meet eyes as troubled as his own. Each understood the other.

"I wish I had some money of my own," the younger man exclaimed; "but I haven't a dollar that actually belongs to me. I am going to borrow a little from Sloan."

"I can't do that much," was the sorrowful reply. "And there ain't nothin' I'd rather do in the world than walk up there and drop a couple of hundred on that pile. I'm—I'm—"

His manner indicated that he was about to relapse into stronger terms. He suddenly whirled. A hand had been laid on his sleeve and a low, steady voice said, "Excuse me, I heard you talking and I understand. I know what you feel. I want you to permit me."

It was Mrs. Meredith who had walked around behind them unobserved and now held out her hand. They fell back, embarrassed. She appeared to fathom their position.

"I know," she said. "I wasn't eavesdropping. I saw you here. I wanted to talk to you both and so, well, I overheard. Take this, won't you? Please permit me."

Bill suddenly reached his hand out and found in his palm a roll of bills, rare in that camp. He looked at them curiously.

"There is five hundred dollars in it," she said. "That permits a reasonable gift from each of you. You can return it to me at your convenience."

Neither of them had spoken to her in all this time. Now both voiced thanks. But a moment later Dick found himself talking alone and telling her that he would send her a check within a few days to cover the amount of the loan; but she was not looking at him. He saw that her eyes were fixed on the big man by his side, who stood there looking down into her face. For some reason she appeared embarrassed by that direct scrutiny, and her eyes fell, and wandered around on those standing, nearest. Suddenly she frowned, and wondering they followed the direction of her look. Not ten feet from them, standing stockily on his feet with his high, heavy shoulders squared, his hands thrust deep into his pockets, his firm face unmoved, his hat shading his eyes, stood Bully Presby. He made no movement toward the goal of the contributors, and seemed to have no intention of so doing. As if to escape an unpleasant situation The Lily suddenly walked toward him.

"Good-evening, Mister Presby," she saluted, and he slowly turned his head and stared at her. He did not shift his attitude in the least, and appeared granite-like in his rigid pose.

"I suppose," she said, "that you have put something into the contribution."

"I have not," he replied with his customary incisive, harsh voice. "Why should I? The contribution means nothing to me."

The brutality, the inhumanity of his words made her recoil for an instant, and then she recovered her fearlessness and dignity.

"I might have known that," she said, coolly. "I should have expected nothing more from you. The lives of these—all these—" and she gestured toward those around—"mean nothing to you. Nor the sufferings and poverties of those dependent on them."

"Certainly not," he answered with a trace of a harsh sneer outlined on his face. "If they get killed, I am sorry. If they live, they are useful. If they are lost, others take their places. They are merely a part of the general scheme. They are for me to use."

His words were like a challenge. He watched her couriously as if awaiting her reply. Dick felt Bill starting forward, angrily, then checked him.

"Wait!" he whispered. "Let's hear what he has to say."

The Lily took a step forward to arraign him. Her face shone whiter than ever in the light of the torches.

"And that is all! That is your attitude?"

He did not answer, but stared at her curiously. It seemed to anger her more.

"I wonder," she said, "if you would care for my estimate of you! I wonder if you would care for the estimate of those around you. It does not seem strange that you are called by the fitting sobriquet of 'Bully Presby.' You are that! You are one of those shriveled souls that fatten on the toil of others—that thrive on others' misfortunes and miseries. My God! A userer—a pawnbroker, is a prince compared to you. You are without compassion, pity, charity or grace. Your code is that of winning all, the code of greed! Listen to me. You doubtless look down on me as a camp woman, and with a certain amount of scorn! But knowing what I am, I should far rather be what I am, the owner of the High Light, a sordid den, than to be you, the owner of the Rattler, the man they call Bully Presby!"

To their astonishment he leaned his head back and laughed, deeply, from his chest, as if her anger, her scorn, her bitter denunciation, had all served to amuse him. It was as if she had flattered him by her characterizations. She was too angry to speak and stood regarding him coldly until he had finished. He turned and appeared for the first time to observe the men of the Croix d'Or scowling at him, and his laugh abruptly stopped. He scowled back at them, and, without so much as a good-night salutation

turned and walked away and lost himself in the shadows of the street.

"Oh," she said, facing them and clenching her hands, "sometimes I hate that man! He is unfathomable! There have been times when I wondered if he was human."

She bit her lip as if to restrain her words, and then looked up at the partners.

"And there are times," drawled the big miner, "when I wonder how long I'll be able to keep my hands off of him. And one of those times has been in the last minute! If you think it would do any good, I'll—"

She looked up at him and smiled, for the first time since they had met. She interrupted him.

"No, the only way you can do any good is to make your contribution. I'll go with you."

They walked together toward the box which was now deserted, save by the doctor and one other, who were scooping the money into a water pail they had secured somewhere. Bill threw his roll of bills into it and the doctor looked up and smiled.

"I knew you would come," he said. "And that, with the two thousand that Mrs. Meredith has volunteered—"

She checked him.

"That was to be my secret. Please, none of you, speak of it again."

"As you wish," replied the doctor. "And I apologize. Now I would suggest that you take charge of this and take it to the High Light. I'll send it over to-morrow by Jim. The boys done well."

That was all he said, and yet in his simple sentence was much. The camp had done well. He straightened up with an air of weariness.

"This pail is pretty heavy," he said. "Won't you take it, Mathews, and carry it over?"

The miner caught it up in his arms, fearing lest the bail break loose under its weight. The doctor bad them good night, and they started toward the High Light, leaving the torch man to extinguish his flares. She talked freely as she walked between them, expressing her relief that none of the destitute in that distant camp of mourning would suffer unduly after the receipt of Goldpan's offering. As they entered the house of the lights and noise the bartender nearest hailed her, wiped his hands on his apron and reached out an envelope.

"Bully Presby was in here about an hour or two ago," he said, "and left this. It was before you and Doc Mills was goin' out to try and get the boys interested."

She tore it open, then flushed, and passed it to the partners who together read it.

"I hear," the letter read, "that some of the men who were killed over at the Blackbird used to work for me down in California. Also that there are some women and children over there who may have a hard time of it. Will you see to it that this goes to the right channels, and regard it as confidential? I don't want to appear to be a philanthropist on even a small scale. Presby."

Pinned to the letter was a check. It was for ten thousand dollars. Bill lifted it in his fingers, scanned each word, then handed it to Mrs. Meredith who stood frowning with her eyes fixed on the floor.

"I've known burros, and other contrary cusses, in my time," he said, slowly, "but this feller Presby has 'em all lookin' as simple, and plain, and understandable, as a cross-roads guide post."

And The Lily, contrite, agreed.

CHAPTER IX

WHERE A GIRL ADVISES

"There's one thing about you, pardner, I don't quite sabe," drawled Bill to his employer as they sat in front of their cabin one night, after discussing the assays which Dick made his especial work. "You ain't as talkative as you used to be. Somethin's on your mind. It's more'n two weeks now since I had time to think about anything but the green lead, and I'm beginnin' to notice. Where the devil do you go every mornin' between nine and eleven?"

Dick turned toward him impulsively, and then made no reply, other than to laugh softly. Then slowly he felt a wave of embarrassment.

"Not that it's any of my business, bein' as you're you and I'm me; but we were pardners for some years before things changed and made you the boss and me the hired hand. And it may be I'm undue curious. Who's that girl you go up on the pipe line to meet every mornin'?"

His question was so abrupt that, for an instant, the younger man had a hot, childish anger; but he controlled himself, and wondered why he should have been annoyed by the frank interrogation.

"Miss Presby, the lumberman's daughter," he said crisply. "But what interests me most is how you knew?"

The elder miner slapped his leg gleefully, as if pleased with a joke, and said: "Well, I went up there five or six days ago, tryin' to find you, because I'd lost the combination to the safe, and wanted to look over them old drawings. I sneaked back, because I was a little jealous to see you sittin' on the pipe talkin' right friendly to such a good-looker. Three evenin's later while you were workin' on them mill samples, I thought I'd like to see the whole of the line. I took a walk. There's been a real good horse trail worked into the ground up there, ain't there? And it's a new trail, too. Seems as if somebody must have been riding up and down that way every day for just about two weeks. And it's serious, too, because you don't say nothin' to a man you was pardners with for more'n seven years. Hey, Dick! What ails you, anyway?"

The younger man was on his feet with one of his fists drawn back, in an attitude of extreme temper.

"Suppose after this you mind your own business?"

For a full half minute the elder man sat there in the dusk, and then said slowly: "All right, boy—I mean, Mister Townsend—I will hereafter."

In the gloom his figure seemed suddenly bent forward more than usual, and his voice had a note of terrible hurt. It was as if all the ties of seven years of vicissitude had been arbitrarily cast off by his old partner; that they had become master and man. His words conveyed an indescribable sorrow, and loss.

"Bill!"

Dick's arm had relaxed, and he had stepped closer. Mathews did not lift his head. A hand, pleading, fell on his shoulder, and rested there.

"Bill, I didn't mean it! I'm—I'm—well, I'm upset. Something's happened to me. I didn't seem to realize it till just now. I'm—well, thank you, I'm making a fool of myself."

The faithful gray head lifted itself, and the gray eyes glowed warmly as they peered in the dusk at the younger man's face.

"Whe-e-w!" he whistled. "It's as bad as that, is it, boy? Just forget it, won't you? That is, forget I butted in."

Dick sat down, hating himself for such an unusual outburst. He felt foolish, and extremely young again, as if his steadfast foundations of self-reliance and repression had been proven nothing more than sand.

"I know how them things go," the slow voice, so soft as to be scarcely audible, continued. "I was young once and it was good to be young. Not that I'm old now, because I'm not; but because when a feller is younger, there are hot hollows in his heart that he don't want anybody to know about. Only don't make me feel again that I ought to 'mister' you. I don't believe I could do that. It's pretty late to begin."

A Magnificent Subscription Offer

Splendid Cloth Bound Six Volume

Dickens' Set Value - - - **$3.00**

The Missouri Farmer For Two Years; Value **$1.00**

Value of Books & Paper **$4.00**

Special Offer $2.00

The Most Widely Read and Widely Loved Books in the English language are Charles Dickens. No matter how tastes differ or fashions change, the charm and appeal of Dickens is perennial. The characters he created are better known today than ever—and none can hope to attain a knowledge of English literature without reading again and again Dickens' best works.

By taking advantage of this great offer these six splendid volumes will only cost you One Dollar and we will mark up your subscription to THE MISSOURI FARMER for three years!

If you already happen to have a set of **Dickens** we will give you your choice among the following sets: **Stevenson, Kipling, Shakespeare, Hugo, Scott, Dumas, Poe, Lincoln.** Each of these sets comes in six splendid volumes and will afford a lot of fine reading for yourself and the children this winter. These books come from England where war conditions have destroyed the market for books—and never again will you have an opportunity to buy these classics **at such ridiculous figures!** If you would like several of the above sets and will ask your friends to subscribe for THE MISSOURI FARMER we will make you a proposition by which, through a little effort you can easily own all of them. **This offer will hold good for a short time only and you should therefore act promptly!**

No man or woman's education is complete until he or she has read these Great Classics which have been translated into every civilized tongue! Read them this winter and enrich yourself with the thought of the greatest writers the world has ever known

THE MISSOURI FARMER,
Columbia, Mo.

Gentlemen—Inclosed please find $2 for which mark up my subscription to The Missouri Farmer for three years and send me postpaid a six volume set of

"IT DOESN'T COST A CENT"

It doesn't cost a single cent
To pass a pretty compliment;
In happy, smiling, gracious way,
A cheery, pleasant word to say.

It doesn't cost a cent to take
Things as they come, to gently make
Out of the wise Creator's plan
The very, very best we can.

It doesn't cost a cent to bring
To lonely hearts, and sorrowing,
A bit of comfort, to shut out,
Just for a moment, gloom and doubt.

It doesn't cost a cent to clasp
A nieghbor's hand in friendly grasp,
To bid him feel by one warm press
The sympathy one can't confess.

It doesn't cost a cent, my friend,
An absent brother to defend;
The stepping-stones to heaven above
Are little daily deeds of lovo.

—Christian Observer.

Home Makers Conference

This Department is Edited by Miss Alice Kinney, New Franklin, Mo.

THE INTERNATIONAL CONGRESS OF FARM WOMEN

The International Congress of Farm Women stands for a great world's organization of all rural clubs and societies, co-operative, incessant in its quest for help, trying always to reach the universal need and if possible to relieve it.

Besides the regular officers and the executive committee there is affiliated with the congress, a Women's Press Club whose work it is to disseminate information regarding the congress through the various papers they represent. There is also a National Association of Farm Women Managers, composed of the congress who own and manage their own farms.

The organization was born of a need of better understanding and more of a co-operative spirit among women in rural districts. It is the reaching out by the farm women themselves to grasp the opportunity that is being held out for them by the government and agricultural colleges.

The congress is composed of women who think and who are willing to put their shoulders to the wheel and lift some of the loneliness out of the lives of those less fortunate than themselves—women who have caught the vision of the ideal life on the farm and have been watching with grave apprehension the wholesale rush of their boys and girls into the already overcrowded markets for humanity in the great cities, and have pledged their lives to stop it by making the rural homes more to be desired, adding to the social pleasures, beautifying the surroundings, improving the country roads, helping to consolidate the schools in the rural districts and giving the boys and girls a lively interest in life. For this reason it is asking the affiliation of every organized country club, not as an auxiliary but as a federation of rural clubs and societies all working for the same object. "In union there is strength." The latch string of the International Congress of Farm Women is out and the door will be opened wide to any club or individual who desires to join the farm women's movement.

Remember the congress lives that the farm woman may live a larger life, it works to keep in touch with progress and pass the good things along. Every word, deed or thought of the congress has been to enrich and enoble the lives of rural women and bring about better conditions, better equipment and more contentment in rural homes.

Mrs. Belle VanDorn Harbert,
Manzanola, Colorado.

These women are asking for a National Farm Women's Bureau. Shall the Missouri farm women remain an unknown quantity in this movement. Many have caught the inspiration of co-operation but there is still a great lack of this spirit to make the effort a success. Slowly the rural clubs are affiliating their local organizations with the state farm woman's movement as worked out by the Missouri Homemakers' Conference, but there is still a great awakening needed to make ourselves the potent power that is possible if only our women would lend their aid.

The Missouri farmer is fast learning that his best is only realized when affiliated with some co-operative state organization; this is just as vitally true of the women and their development.

We should be pleased to have some of our readers send in articles on co-operation among women. A. K.

HOME ECONOMICS IN SCHOOLS

As we follow up the results of the Movable Schools of Home Economics that have been held over the state by the Agricultural Extension Service of the Missouri University, it is most encouraging to note the growing interest in these demonstrations by the community at large. It has started a wave of thought, plans and action that we can safely predict for this fall that more pantry shelves will be groaning under the added weight of canned vegetables, soup, meats and fruit than in any other former year.

The store-room will become a veritable household silo, which will mean as much to the health and enjoyment of the farm family during the shut-in period of cold days of winter as the outside silo does to the comfort of our live stock.

Miss Helen Louise Johnson, National Chairman of Home Economics, General Federation of Women's Clubs, tells us in a little booklet how we can help the betterment of "all the homes of all the people" in the following ways:

"Home economics work began in the teaching of cooking and sewing, first in private classes, then in public schools. Owing to the expense of installing equipment it was easier to introduce it into high schools than into the grades, a mistake which still persists for it is needed in both places, but it should be compulsory in the grades.

"More and more are we realizing as the years pass on that the art of living is not inherited but must be taught and learned; even yet there is a willingness to teach young people nearly everything in school and college except those things which deal most directly with daily life.

The application of the lessons we learn in school are even yet too widely separated from the fact, or they follow too slowly on the lessons themselves.

The fundamentals of life and living must be taught in the grades in forms suited to the age and capabilities of the children, because the majority of children leave school at the end of the compulsory age and unless these things are taught before that period and the students are expected to study them just as much as geography or arithmetical facts, the girls may have no opportunity to learn the valuable lessons upon which the health, prosperity and happiness of their families depend.

"The scope of home economics should no longer be limited in any woman's mind or ideas, to mere cooking or sewing or any household activity, necessary as they may be and capable as they are of expansion into acceptable forms of scientific work.

For the benefit of our own and other women's homes, for the men, women and children in them it is necessary that every effort be made by those working in this field to educate the public to the larger and more comprehensive view of the cause we represent."

After our own needs have been successfully cared for in the pantry stores this year, perhaps another season we can plan and care for a garden sufficient for two families, either with fresh vegetables during the season or later in the little glass silo, thus by taking care of the farm surplus it can be turned into a financial result; if any of our readers have had any experience in this line of home industry, we should be very much pleased to hear from them. K.

To Remove Stains

Fruit Stains—Pour boiling water through the stain. A peach stain may be removed by allowing the article to freeze.

Ink—Let soak in sour milk or use lemon juice and salt.

Medicine—Soak in alcohol.

Iodine—Soak in sal soda or dilute solution of lye.

Blood, Cream or Egg—Wash in cold water first.

Paint—Use turpentine. On delicate materials, use chloroform. For dried paint, use equal parts of ammonia and turpentine.

Iron Rust—Use lemon juice and salt in sunlight.

Grass Stain—Rub with lard, butter, alcohol or kerosene before washing.

Tea and Cocoa Stains—Wash thoroughly in cold water and then pour boiling water through the stain.

Coffee Stain—Pour boiling water through the stain.

—From Extension News Service, University of Nebraska.

There is just as great need for labor-saving conveniences in the farm home as there is for labor-saving machinery on the farm. We hope those who have found their housework lightened by some improvement will write us about it for the benefit of other women who need help. Write on any subject concerning the home or its environment.

Farm Management

D. H. Doane, University of Missouri

Happiness comes from striving, doing, loving, conquering; always something positive and forceful.

What matter then, where your feet stand or wherewith your hands are busy, so that is the spot where God has put you and the work he has given you to do.

Mr. Maris, County Agent of Saline County, in referring to the township fall festivals held in Jackson County says:

"I had an opportunity to visit a county last week in which the township school fair has been brought to its highest state of development by County Agent E. A. Ikenberry. There I found township fairs surpassing some county fairs; at least, from the standpoint of enthusiasm, interest and educational value. Having had several years' acquaintance with county and state fairs I saw more attention paid here to the exhibits and awards than at any other fair I ever attended. Children were interested because it was their work and the work of their school, parents because it represented the work of their children. One man passing by the corn display remarked, "The quality of our corn has been improved 100 per cent since we began holding these school fairs." Still there was abundant evidence that there were still relatively few who knew how to select good show corn and good seed corn."

Wintering Farm Animals

If we have plenty of bluegrass pasture the summer feeding of most of our livestock is a simple matter. We turn out when grass gets good in March or April and leave the stock on pasture until the grass is gnawed in the ground or winter drives us into shelter and snow covers up nature's feed. In some cases these methods are profitable and no criticism can be offered. In others, no small improvement could be worked by a little intelligent planning.

Summer has passed now and we are facing winter. Little can be done if we have not provided during the summer for the needs of the winter, but to those of us who have provided the winter problem becomes one of adaptation and utilization, a few words from the storehouse of experience of others might be mentioned at this time.

The Work Stock: Some of you will remember that during the fore part of this year I mentioned the fact that a large per cent of our farm income was consumed by work stock that was useful only a small per cent of the time each year. Mr. Johnson tells us that on the average our farm work horses work about three hours a day. Figuring it up for Missouri we get the results: the average work horse can handle about twenty crop acres, that is, twenty acres devoted to crops of some kind, in Missouri our average work horse handles about twelve acres or just about half of what he should. Or, putting it the other way around, we have two horses where good management would require only one. If the figures published by the Farm Management department, of $85 a year as the average cost of keeping a horse, are correct, it shows that Missouri is paying an excess feed bill every year for unneeded work stock of about $50,000,000. The suggestion, therefore, for the winter of 1915 is two-fold. First, get rid of every horse that you can possibly spare. Foreign army demand will take the common classes; let them go even though you have to sacrifice them. Now that you have culled down to the profitable and most useful ones, what are the best rations to feed them? Mr. J. Ed. Hall, of Lamonte, Mo., finds that shredded corn and cowpeas or soybeans make an excellent and cheap roughness. I will not refer to corn, oats and timothy for these are old standard feeds and if you have them you will probably use them. I might further suggest that every grower of soybeans reports enthusiastically about the results obtained from feeding soybean hay or even the threshed straw to the horses. They say that their work animals do well on it and it appears to be very nutritious, for they can generally cut down on the grain when they are feeding soybeans.

FREE WATCH!

Nearly every boy wants to own a watch—not only to tell the time of day but because owning a watch is one of the mile posts on the road to manhood. The watch illustrated above is handsome and a splendid timekeeper. We will send it FREE to every farmer boy who sends us **four new subscriptions to The Missouri Farmer** at 50c a year... If you want one of these handsome watches free write us **at once!**

ALL STEEL GARAGE $59.25

The Butler "Round Ruf" SIZE 10 X 14

Full protection and at least cost. Fire-proof. Corrugated. Easily put up. Attractive in appearance. Portable. Useful as a machinery, tool or storage building. Additional sections to increase length furnished at any time. If your dealer does not handle, write us for full information and prices on other sizes.

BUTLER MFG. CO.
280 Butler Bldg.
Kansas City, Mo.

Grain Bins, Tanks, Silos. Write for booklet on Stock Fountains and Hog Furniture.

The Breeding Ewes: If we have good pasture up until Christmas, the breeding ewes will not need much other feed. Early in the season, perhaps, they can eat some fodder, but when winter finally sets in and as the lambing period approaches, nothing but leguminous roughness should be considered. If you have available cowpea hay, soybeans, alfalfa or clover, you will find these excellent and satisfactory. Corn stalks have proven disastrous in a number of cases and should not be used if it is possible to avoid them. Possibly a little grain after the lambs begin to come will be found profitable; bran and oats will probably be the best kind to use.

The Hogs: Did you ever try hog hay? I hear some farmer say, "Who ever heard of hog hay?" Well, we hear of it in Kansas and also in Missouri. The Kansas kind is alfalfa; the Missouri kind that our farm management men have found most acceptable is soybeans. When the soybeans are cut with a binder, the bundles are thrown into a specially constructed rack for the hogs. The floor of it is made A-shaped, the highest portion in the middle and sloping toward the outside. The hogs pull the hay down through the slats, the leaves and beans that are pulled off fall on the floor beneath, and the hogs get an opportunity to get at them without tramping them down in the mud. A good grade of unthreshed soybeans fed in bundles will save the purchase of oilmeal, shipstuff, tankage, etc. It reduces the corn bill and the cost of keep of the sows and fall pigs.

Mr. Johnson tells us that it costs on the average about $25 a year to keep a sow. Where wintering is done on rye as Mr. Gartin does it, we find that this cost is cut nearly in half, or reduced to about $14.50 a year.

In short, our most valuable experience in wintering hogs shows us that alfalfa or soybean hay, fed to furnish protein, and the use of wheat or rye for winter pasture, makes our most valuable wintering ration for hogs.

Spangled Hamburg Cockrels

For Sale—Spangled Hamburg Cockrels at two dollars each. Lee Sallee Rfd. 1, Wheeling, Mo. 11-1-2t

"Fifty Million Dollars—the Value of the American Raw Fur Collection"

A. B. Shubert, Inc., Chicago, U. S. A., the largest house in the world, dealing exclusively in American raw furs, in a letter to the editor says in part as follows:

"Fifty Million Dollars" worth of raw furs. Quite a large sum of money when you come to think of it. This is a normal season's production of the raw furs of the world, and American raw furs make up about two-thirds of the world's collection. Can you imagine fifty million dollars changing hands for American raw furs? Yet such is the case as near as can be estimated from the account books of the largest collectors. The merry old world still goes around and the coming of winter brings on one more raw fur season. It is one of the oldest industries known to man, dating back even before the time of Christ, and in spite of the fact that millions of fur-bearing animals are killed off every year, in spite of the fact that rigid game laws are enacted to protect the fur bearers, the game is far from being extinct, and when the collections are smaller, the price goes up accordingly. It is wonderful the part that furs have played in the history of man. They have caused wars, led to the exploration of new lands and changed the maps of nations, but more wonderful still are the varied fluctuations in the market. It is the greatest speculative game in the world. When the raw fur market is at its highest pitch, Wall Street fades away to nothing alongside of it, and so it is with the Steel Trust and the Tobacco Trust and the rest of our largest industries. Before people knew what steel or tobacco was, they were skinning animals for their fur, and still the game has not died out, in fact, this season promises more activity than ever in the fur business.

Furs are an absolute necessity as they form the protective clothing of those whose occupation brings them in contact with the elements of winter. Furthermore, furs are extremely fashionable. Milady's wardrobe is not complete without most of her outer garments for fall and winter, her hat, evening gown and dresses trimmed with fur. And it is uncommon to see shoe tops also trimmed with fur.

Live Stock Notes

R. P. ROYCE, Fieldman

Snyder's Red Polls and Spotted Polands

In a recent letter from M. L. Synder, Polo, Mo., who advertises Red Polled cattle in this paper, he says that trade has been good with him and that he still has a number of good strong young bulls that he is putting the price down on. Mr. Synder also offers a few choice Spotted Poland China boars of the most approved line of breeding. Our readers will do well to get in touch with him.

Need a Holstein Bull?

If you do you can hardly afford to overlook the offer made by the Black and White Farm, Baden Station, Mo. This well known farm is offering a number of extra good young bulls sired by their great bull Dutchland Sir Hengerveld Rag Apple, one of the best bred bulls in Missouri. These bulls are all of good ages, are nicely marked and come from a tuberculin tested herd, that is making records in production. Write for prices.

Watson Offers Excellent Duroc Bargains

The other day I met a man who had just returned from New London and in speaking of his trip he informed me that he had visited W. C. Watson's Duroc herd and "believe me," he said, "that man Watson has some herd. I don't know when I have seen a better spring boar than the February pig by Illustrator and out of Tattletale 39th." This man might have added that Mr. Watson also had a lot of other richiy bred spring boars that he is pricing worth the money. Mr. Watson has established a herd that ranks high and is bound to be a potent factor in the breed in this state. Write for prices or visit the herd. Mention this paper.

Oakwood Polands and Shorthorns

H. S. Williamson, proprietor of the Oakwood Stock Farm, Centralia, Mo., advises us that he has an extra good lot of Poland China boars and Shorthorn bulls for sale.

Mr. Williamson is one of the best known livestock men in Missouri having been engaged in the pure-bred business for years.

Spring boars, or yearling boars, spring gilts, fall gilts or bred sows can be furnished, sired by either of Mr. Williamson's well known herd boars, Success and Controller.

The writer is not familiar with any herd that can show more bone than will be found in the Oakwood herd, and this desirable quality is largely due to the influence of the first named boar. In Shorthorns, most anything can be furnished our readers, but just at this time very attractive prices are being made on some extra good young bulls. Get his prices.

A Great Chance for Poland Breeders

In this issue appears the advertisement of W. E. Williams of Silex, Mo., who, on Thursday, November 18, will hold a closing out sale of his splendid herd of big type Poland Chinas. That this presents a great opportunity to lovers of big type Polands goes without saying for this means that Mr. Williams will close out one of the finest herds of this breed that can be found in the Corn Belt. Included in the offering will be herd boars of established merit, brood sows, spring gilts and boars.

The chief feature of the sale will be Longfellow Sampson 66636, a three-year-old sire of proven merit. He is by Big Sampson by Sampson and out of Lady Longfellow by Tecumseh Longfellow, bred by Williams Bros. of Villisca, Iowa. His quality as a sire may be seen by the hogs which go into the sale—many of them being his get. The six big, roomy sows to be sold are by Longfellow Sampson, Blue Valley Expansion, Hadley Blain and Chief Price Jr. They range in age from yearlings to three-year-olds. They will be bred. There will be 40 spring gilts go through the ring. They are sired by Longfellow Sampson, Price Wonder, A Wonder and Major Look.

In regard to the gilt offering, Mr. Williams says: "They are the best I ever raised, and as I have not sold one this year, there will be some mighty good ones among them. They will be sold open and just in the right condition to breed. Included in the 14 spring boars there is one extra good one that should go to head some good breeder's herd. He is an A Wonder boar that is simply outstanding. I had intended to keep him, but as this is a closing out sale must let him go." The spring boars are by Longfellow Sampson, Major Look, Price Wonder and A Wonder. The spring gilts and boars are out of sows by Big Sampson, Pawnee Nelson, Monarch Big Bone, Expansive Equality, W's Wonder, Hadley Blain, Blain's Wonder, Longfellow Jr., Long Scamp and Blue Valley Expansion.

This is going to be an exceptional opportunity to pick up some choice stock at low prices, stock that you could not purchase except at a closing out sale. Remember the date is Thursday, November 18. Write for the catalog and arrange to attend. Should this be impossible, send your bid to R. P. Royce, Fieldman for The Missouri Farmer, who will be at the sale and who will be glad to carefully look after your interests. When you write for catalog, please mention The Missouri Farmer.

Bakers' November 15th Sale

A sale of Poland Chinas that should prove very attractive to our readers will be held at Rich Hill, Mo., on Monday, November 15, when W. Z. Baker will offer 35 head of superior fall and spring boars and spring gilts. The Maple Grove herd is no doubt well known to most of our readers. For several years past it has figured strongly in the show rings of the Mid-West fairs, and always with credit. The proprietor, W. Z. Baker, is a member of the same Baker family that has been such a potent factor in the development of the big type Poland China in Southwest Missouri.

This year the Maple Grove herd was exhibited at Topeka, Hutchison, Sedalia, and St. Louis, and at each of these shows secured its share of the prize money. At St. Louis this herd practically swept the boards.

In the coming sale Mr. Baker will sell about 35 head and in the lot are a number of his prize winning boars. There are 5 junior yearling boars listed, anyone of which should look good to a breeder in search of a herd boar. These 5 boars are litter mates and are sired by the great boar, King John, and are out of Hadley's Beauty 2nd, the sow that attracted so much attention in 1913, the year she was made grand champion. Out of two litters from this sow there are 9 prize winners. One of them a champion, 4 won blue ribbons, 3 were reserve champions, and the balance were well up in the money. In the spring of 1913 this sow farrowed 11, the following fall, 10, in 1914 she farrowed 16 in two litters and in 1915 she farrowed 25 in two litters. Two other attractive boars are furnished by Blue Grass Maid 3rd. One of these two boars is a fall yearling and the other is a March pig. The yearling has a second prize to his credit and is litter mate to a boar that Mr. Baker is keeping for himself. These two boars are sired by King Hadley.

The entire offering has been carefully selected by Mr. Baker and this sale will afford an excellent opportunity to buy well bred Polands carrying the blood of champions and grand champions. Among the gilts are several that would look good in most any herd and they are of the same breeding as the boars.

Everything in the sale is immune. Send at once for the catalog and arrange to be at the ring side when the sale starts. R. P. Royce will represent this paper at the sale and will be glad to handle any bids for our readers who are unable to attend. Kindly mention this paper when you write.

White's Durocs Please

Under date of October 7th A. O. Carter, cashier of the bank of Dexter, Mo., writes A. White Jr. as follows:

"The gilt Rosalee I bought from you last June farrowed 8 of the finest pigs I ever saw to the service of your champion boar, Crimson Col. I Am."

Mr. White receives many letters along the same line from his customers and he feels that he can please any of our readers who are in the market for Durocs of merit.

Just at present Mr. White is offering some exceptional bargains in spring boars. Most of these boars are early pigs sired by the junior champion boar Crimson Col. I Am, and are out of sows of the richest breeding. Any one in need of a really high class boar should take a look at one of the litter out of the great producing sow, Missouri Lady, and sired by Crimson Col. I Am. He is a pig carrying excellent lines and shows a remarkable degree of quality. Lady Olean, the sow Mr. White secured in the Taylor sale last February, has a cracking good boar in her litter, and another popping pig is by Carl Orion. Mr. White is succeeding in producing a class of Durocs that show unusual size and quality. Get his prices before buying.

Acid Stomach Claims Millions Of Hogs!

An enormous percentage of all hog losses is due to stomach disturbances and stomach disturbances are largely due to acidity, which interferes with the digestive juices and thereby impairs digestion. Result—thin, scrawny hogs that seem half-starved no matter how much they eat. Millions die. Thousands of hog raisers have proved that the safe and reliable way of neutralizing this acid and preventing its forming again is to mix just a little

MERRY WAR LYE

in swill, or with the drinking water, if the hogs are on dry rations. It not only neutralizes the acid but also sweetens the swill, thereby preventing the fermentation that causes the acidity. Moreover, it adds weight to hogs because it helps thorough digestion, leaving no waste food. Hogs come right up, under this simple treatment which produces amazing results.

There's as much difference in Lyes as there is in Doctors, so don't count any trial made with any other than Merry War Powdered Lye. The experience of thousands of hog raisers has proved the value of Merry War Lye. Its use is *not* an experiment.

Send for free booklet filled with letters from hog raisers. They will convince you. But a better way to be convinced is to give it a trial on your own hogs. The cost is practically nothing. It is absolutely safe to feed to hogs according to plain, easy-to-follow directions on label.

Keeps Poultry Healthy Merry War Powdered Lye mixed with feed or water according to directions on label, helps to make poultry sturdy and better able to resist White Diarrhoea, Diarrhoea from Indigestion, Cholera, Roup, Limberneck, Gapes, Worms, etc.

"There Are No Substitutes"

GENUINE GUARANTEED Wm ROGERS & SON **FREE** OAK DESIGN SUGAR SHELL

Send Only 3 "Merry War" Lye Trade-Marks

Missouri Poland China Breeders Organize

Recognizing the need of an organization to push the breed the Missouri Poland China breeders met Wednesday evening of fair week and organized the Missouri Poland Chnia Breeders' Association. About twenty-five breeders were present and after electing the following officers: Park Bennett, Lee's Summit, Mo., president; E. D. Frazier, Drexel, Mo., vice-president; C. H. Walker, Kansas City, Mo., secretary-treasurer; directors, T. E. Durbin, King City, Mo.; J. F. Richards, Bevier; W. H. Bridges, Slater, Mo.; Will G. Lockridge, Fayette, Mo.; W. A. Baker, Butler, Mo., and M. D. Porter, Vandalia, Mo.. Each member was made a committee of one to secure other members.

It was decided to hold the annual meeting at Columbia, during Farmers' Week, where an effort will be made to federate each of the various breed associations into a state association for swine men.

Much good can be accomplished through organized effort and with such enthusiasm manifested among the Poland China men who attended the meeting some practical results can be looked for. Every breeder of Poland China hogs in this state should send in his name to the

Taylor Breeds and Sells Champion Durocs

A lesson to all breeders young and old may be found in the record of Chas. L. Taylor, Olean, M., whose herd of Durocs is already well known to many of our readers. This lesson has to do with the value of good blood properly and intelligently handled.

When Mr. Taylor started in the business of producing pure bred swine he made his purchases very much after the fashion of so many—he let price influence him in his selections. However, one trip to the state fair showed him the mistake he had made and without consulting onyone he disposed of his whole herd and after studying the breed and the blood lines of the winning herds he made a careful selection of a few bred sows. Included in the lot happened to be a bred gilt called Queen Ester. This gilt was sired by B & C's Col., grand champion at Iowa and Illinois in 1909 and her dam was by the first prize junior yearling at Iowa. Queen Ester was carrying a litter to the service of Crimson Wonder 3d, grand champion at Nebraska in 1908, he by Crimson Wonder Again, grand champion at Iowa in 1907 he by Crimson Wonder I Am, grand champion at Iowa in 1906, and he by Crimson Wonder, first in class at Nebraska in 1904 and third in class at World's Fair at St. Louis. In this little was a boar afterwards called Col. Wonder. It will be noted from the above that Col. Wonder came from a distinguished line of producing sires and dams. Col. Wonder was fitted and shown as junior yearling in 1912 and won first in class at Sedalia and at the American Royal. The following year he was made first prize aged boar, senior and grand champion at Sedalia. His dam was shown in 1911 and won first as junior yearling sow at Sedalia, and the following year was made first prize aged sow at the same show. In 1913 at Sedalia the get of Col. Wonder won 10 prizes. In 1914 his get won 7 prizes, and included in the list was the first prize junior yearling sow and senior and grand champion sow. In 1915 the Taylor herd won 35 prizes at Sedalia, including 15 first prizes, and juniour champion boar and senior and grand champion sow. At St. Louis the following week the herd was even more successful.

There is food for thought in the above record, and if it mean's anything at all, it means that blood will tell, and that Chas. L. Taylor has the kind of blood that talks. Mr. Taylor is offering a few choice gilts either sired by or bred to Col. Wonder at very reasonable prices. He also offers choice spring boars sired by. Col. Wonder at $25 etch. Here is a chance to get something worth while at unusually low prices. Mr. Taylor advises our readers who may be interested, to send check in first letter. You are safe in doing this as Mr. Taylor will send out only dependable boars. Mention this paper when you write.

Chester White Breeders for State Association

Following the lead of other swine breeders, the Chester White breeders met at Sedalia during fair week and organized the Missouri Chester White Breeders' Association. The attendance was rather light but every breeder present was enthusiastic and all pledged themselves to interest other breeders and to make every effort to haev a large representative at Columbia, where the next annual meeting will be held during Farmers' Week. The following officers were elected: J. J. Wills, Platte City, Mo., president; Col. T. E. Deem, Cameron, Mo., vice-president; S. D. Frost, Kingston, Mo., secretary-treasurer. J. H. Harvey, Maryville, Mo.; W. P. Doolittle, Woodland, Mo., and Henry Fehner, Alma, Mo., were chosen directors. All breeders of Chester Whites who are interested in seeing this breed make progress in this state should send in their name to Secretary S. D. Frost.

Andrews Has Good Sale

The annual sale of spotted Poland Chinas held by the Andrews Stock Farm, at Lawson, Mo., Thursday, October 14, resulted in the very satisfactory average of $33.25 on the forty-two head that were sold. This average is not quite up to last year, but the fact that practically the entire offering this yera was of spring farrow no doubt accounts for the difference.

A splendid crowd was on hand when Col. Gross started the selling and bidding was brisk from the start. No extreme high prices were registered but very uniform range of prices obtained. Col. Gross was efficiently assisted in the ring by Cols. Thompson and Mercer.

RED POLLED

RED POLLED CATTLE

HERD ESTABLISHED 16 YEARS

Young stock for sale at all times. Young bulls sired by Logan 13500. The dual purpose kind. Also Spotted Poland China spring boars and gilts.

M. L. SNYDER, - POLO, MO.

sow, Jumbo Wonder II. In King Jumbo Mr. Baldwin has a boar to be proud of, he is bred in the purple, is a splendid individual, showing an unusual combination of size and quality, but more important, he is proving to be a sire of first rank. The prices Mr. Baldwin is asking for King Jumbo spring boars make them mighty good buys. Mention this paper.

Percheron and Hog Sale

On Tuesday, November 9, N. S. Shackleford, of Gallatin, Mo., will hold a closing out sale of Percheron horses, Berkshire and Duroc Jersey hogs, at his farm, 4½ miles northwest of Gallatin, Mo. In this sale will be an opportunity to buy some of the best blood of the three breeds of live stock herein mentioned.

The Percherons are strong in the blood of Carnot, Mr. Shackleford having been a good buyer of the best, in Percherons. The Berckshires represent the blood of many grand champion sires and dams, the foundation having been purchased at Gregory Farm at White Hall, Ill. The Durocs represent the most approved breeding. The catalog will be ready to mail October 25. You should send for one. Kindly mention this paper.

Pawnee Price Boars

Look up the advertisement of J. F. Richards & Son, Bevier, Mo., in which they offer a nice lot of spring boars sired by their former herd boar, Pawnee Price. This great boar died this summer and the present crop of pigs will afford the last opportunity for farmers and breeders to secure his blood. Pawnee Price was one of the biggest quality boars the writer was familiar with. A boar by Pawnee Price will add size and bone and quality to any herd. These boars are priced so that the farmer can hardly afford not to own one.

The Austin Angus Sale

The dispersion sale of Angus cattle held by J. W. Austin at the Fairgrounds, near Carrollton, Mo., on October 5th, proved to be a good sale for both buyer and seller. A general average of $80 was made on the 104 lots sold, which included everything from calves to the herd bull. The cattle were taken off of pasture the Saturday before the sale.

Col. Igo did the selling and was assisted in the ring by Col. M. A. Judy, sale manager, and John D. Blackwell. Below is a list of the lots selling for $75 and over:

Bridges Bros.' Good Polands

Bridges Bros., Slater, Mo., are offering some rare values in Poland China spring boars, sired by Big Bob Wonder. Long Jumbo 2nd, Longfellow Sampson, Wonder Ex and other noted boars. The dams of these pigs are top sows purchased in several of the best sales last winter. Bridges Bros. are practical hog men in every sense of the word. They know how to breed and how to feed in order to get the size and bone so essential in breeding stock. We have seen this offering and know that our readers will like the kind Messrs. Bridges are producing and sending out—especially at the prices asked. Any one in need of a good herd boar prospect will do well to get in touch with this firm. Mention this paper.

Sutherland's Add to Their Angus Herd

At this recent dispersion sale of the J. W. Austin Angus herd at Carrollton, Mo., D. L. Sutherland & Sons, who advertise their herd in this paper, were among the heaviest buyers for the better sorts and secured many good bargains. Messrs. Sutherland have maintained their herd for over 30 years and are at all times on the lookout for opportunities to improve it. Just at present they have a very desirable lot of young stuff on hand that they are pricing worth the money. Included in the lot are most of the well known families.

Shorthorn Bulls and Heifers

June K. King & Sons are advertising a nice lot of Scotch topped bulls and heifers for sale at prices that should prove very attractive to Missouri Farmer readers. Messrs. King have one of the oldest and best known herd of Shorthorns in Missouri and were never in better shape to offer our readers good values than they are now with this lot of young stuff. When you buy from this firm you are assured of not only getting well bred stuff but you get a class of cattle that have made good for Messrs. King for over 30 years. The Peabody herd is maintained under good practical management. Mention this paper.

Col. Wonder Duroc Boars $25

At recent Missouri State Fair my herd won 35 ribbons—3 championships, 15 firsts. Col. Wonder sires my champions—he will sire them for you. Choice bred gilts. Spring boars by Col. Wonder $25 each. Send check in first letter. Nothing but the best sent on mail orders.

CHAS. L. TAYLOR - - - - - - - Olean, Mo.

Durocs With Size and Bone

I am offering a choice lot of early spring pigs with unusual size, bone and quality. Bred right and priced right. Visitors welcome.

A. C. BROCKMAN, R. F. D. 2, Centralia, Mo.

Duroc Boars For Sale

Anything from a 50-lb. weanling to a 500-lb. herd and show boar. We offer some first-class herd header prospects. Good strong boned farmers stock boars. Also gilts. I also have one 16-months and one weanling Shorthorn bulls. Write me your wants. Will try to please you—the price will be right. Over forty old customers are buying here because both prices and stock have been right. Write today for that boar. I have got him. J. E. WELLER, FAUCETT, MO.

A. NO. 1 DUROC SPRING BOARS

I am offering a few extra choice spring boars sired by ILLUSTRATOR and out of TATTLETALE 39th, junior champion International 1913. A few by CRIMSON CHIEF AGAIN. Write or come.
W. C. WATSON. - - - - - - NEW LONDON, MO

Clyde Robbins, Auctioneer **R. P. Royce, Fieldman**

College of Agriculture Offers Livestock For Sale

The department of Animal Husbandry of the College of Agriculture makes an interesting announcement on page 13. The department offers the buying public a choice lot of Poland China and Duroc breeding stock, and also a pair of Percheron brood mares. From time to time the various herds afford a surplus of breeding stock which must be sold.

In the way of Poland Chinas the department is offering 7 big, heavy boned, husky spring boars, sired by the herd boar, Shattack's Standard, and out of some very high class sows carrying the blood most popular in Poland China circles. Spring gilts, litter mates to above boars are also in offer, as well as a number of bred sows.

Some exceptional values are also to be found among the Durocs for sale. A yearling boar by a son of Col. Wonder is a good buy, and the spring boar by Beauty's Model Top, the three time champion, and out of a full sister to S. & C's Valley Chief, grand champion boar at Sedalia and St. Louis this year, is hard to beat. There are also a desirable lot of spring boar and gilts sired by Rexall Col. by the great boar Select Col. There are several useful and attractive spring yearling gilts sired by Tatarrax Again and Col. Wonder 4th that will be sold either open or bred. In addition to the above stuff are a number of tried sows that can be bought worth the money. The department also is pricing for quick sale a pair of Percheron mares. These mares are 4 and 7 years old, one a black and the other a grey. Both have raised colts and are again in foal to the Stallion Honorable, one of the best Percheron stallions owned in Missouri and a sire of demonstrated ability. These mares are offered for no faults but simply because the department can not use them to advantage. They are priced to sell. Here is a splendid chance for some one to get into the Percheron business with a little capital. Address all letters to the department of animal husbandry, College of Agriculture, Columbia, Mo. We would suggest to those of our readers who may be interested that they lose no time in writing as this stock will not remain unsold very long. It is worth something to be able to tell your neighbors that your livestock came from the College of Agriculture.

I'll Rid Your Stock of WORMS

I'll Prove It Before You Pay

Hog Stunted by Worms

I have done it for thousands of farmers and stockmen—I am doing it every day—I'll do it for you. All I ask is the privilege of sending you enough SAL-VET to last all your stock 60 days. If it doesn't do what I claim, I'll gladly cancel the charge. Don't stand by and let worms kill off your pigs and lambs. Don't let your hogs and sheep contract diseases and die. Don't let your horses and cattle continue gaunt and thin-looking as if fed on straw. Get rid of the blood-sucking worms that are stealing your feed and eating up your profits, and even sapping your animals' lives away. I'll rid your stock of these dangerous parasites—I'll do it quick if you'll just fill out the coupon below and mail it to me today.

Look Out for Worms!

Don't let stomach and intestinal worms kill off your lambs and pigs this year. Get the best of these deadly pests before they get the best of you. Now is the time to deal them a death-blow. Don't wait until they multiply by the hundreds — until your lambs and pigs are being eaten up alive. Accept my liberal offer; send the coupon today. Let me rid your stock of worms before you risk a penny. Read this letter:

"My lambs were so sick with worms they could hardly walk. One of them was nearly dead. I never expected it would live. After feeding them SAL-VET they got better and are all well and lively now."

S. Y. THORNTON, Blackwater, Mo.

Lamb Afflicted With Worms

TRADE MARK

SAL-VET

REG. U.S. PAT. OFF.

The Great Worm Destroyer *The Great Live Stock Conditioner*

SAL-VET is a god-send to every stock raiser. Being a medicated salt, (without Antimony) farm animals take it readily and thus doctor themselves. It requires no dosing—no drenching—no starving—no bother at all. It destroys the parasites that cause 90 per cent of all live stock diseases—improves the digestion and makes all farm animals do better, keep healthier and gain faster on no more feed.

PRICES

40 lb. pkge.	$ 2.25
100 lb. pkge.	5.00
200 lb. pkge.	9.00
300 lb. pkge.	13.00
500 lbs.	21.12

No orders filled for less than 40 lbs. on this 60 day trial offer. Never sold by peddlers or in in bulk; only in Trade-Marked SAL-VET packages. Shipments for 60 days' trial are based on 1 lb. of SAL-VET for each sheep or hog and 4 lbs. for each horse or head of cattle, as near as we can come without breaking regular-sized packages.

Send No Money—Just the Coupon

Just fill out the coupon—tell me how many head of stock you have and I will ship you enough to last all your stock 60 days. You pay the freight charges when it arrives and feed it according to directions. If SAL-VET does not do what I claim and you make a specific report in 60 days, I'll cancel the charge, you won't owe me a penny. Address:

THE MISSOURI FARMER

COLUMBIA, MO.

THE HOME OF MISSOURI'S GREAT AGRICULTURAL COLLEGE AND THE MISSOURI EXPERIMENTAL STATION

Let Us Be Thankful

In a few days the annual day of Thanksgiving will have arrived once more and while, as in other years, the most of us have had our share of lights and shadows since last we gathered around the family festal board, yet never has there been a time when, as a Nation, we have had more cause for solemn rejoicing than in this blessed year which will soon be a part of the recorded past.

That some of us have gathered rich harvests while others have come under the ban of the unkindly elements—these are things which the hour glass of time decrees with indiscriminate hand upon the just and the unjust—and there is aught left for us to do but to take up our burdens anew in the hope that the tomorrows of the future may be more kindly and considerate. After all, more important than all else is the health of ourselves and our loved ones—and so long as the good God on high grants us this boon, what matter the disappointments which merely have to do with dollars and which stout hearts can overcome in the sunshine of the days which await us just a little way around the corner? After all, red cheeks, a good digestion and a clear conscience are the real priceless gems of life—and the man who posseses these is a thousand times richer than he, who, with sunken cheeks and palsied hands hugs a bag of gold to his wheezing breast.

In the meantime, let us be profoundly thankful that the angel of peace still reigns within our borders and that no boom of angry guns reverberates through a land where neighborly love and wholesome thrift have not yet been poisoned by the frenzy of war which is grinding beneath its ruthless heel the best there is in European civilization—where liberty and love of principle have not yet surrendered to selfish ambition for commercial and territorial advantage—where it is still believed that nations as well as men should follow the holy mandate and "do unto others as they would be done by."

Let us hope that in the future as in the past our Ship of State may remain anchored in the peaceful haven in which it has so long reposed—that it will not be necessary for us to turn our attention from the quiet pursuits of our farms and factories to the business of building armies and navies and that in the saner moments of tomorrow the great powers across the seas may see the pitiful folly of a strife which is fast robbing them of the flower of their manhood and piling up billions of debts which will hang like a mill-stone about the necks of generations yet unborn.

To the furtherance of these ends, may He Who rules on high help us to bear with fortitude the insolence of those who dare to flaunt our National self-respect until the time when cooler heads once more rule in the councils of the World—for in that solemn hour no nation will dare tempt the just anger of the more than one hundred million souls who swear allegiance to the American flag.

From Plymouth Rock to the present hour there is no blot upon the fair name of our beloved Country. When we fought for liberty and at other times when we passed through the throes of writing certain great principles into our National faith with the point of a bayonet, we gave evidence of a splendid heroism which owes no apology to those who breathe the polluted atmosphere of foreign courts where statesmanship measures its accomplishments by the success of its intrigues, deceptions and bribes and where the sword is the weapon of avarice and greed rather than the instrument of broader human rights. All we ask is the untrammeled privilege to work out our destiny in our own way here in this land which was paid for and consecrated by the blood of our forefathers—and God grant that we may never be compelled to insist upon this right at the point of our swords which every true American hopes may remain in their sheaths for a hundred years to come. In conclusion, let us hope that ere another Thanksgiving day shall come the shepherd will have returned to his flocks, the spinner to his loom and that the Savior's benediction of "Peace on Earth, good will to men" may once more rule in the hearts of all mankind. —By the Author of After-Thoughts.

THE LAND QUESTION AND FARM CREDITS

What to do for our landless farmers has become a most perplexing national problem. Everybody seems agreed that they should be turned into home owners. Everybody seems agreed, also, that absentee landlordism and its attendant evils, should be purged from American life. But when it comes to the "How," and when we must choose as to what means are to be adopted, confusion results, and a thousand tongues are heard in the land.

Yet the American nation must fix upon some policy; for the time-worn custom of considering this matter a personal problem for the individual farmer has failed.

Land ownership has rapidly moved toward concentration; absentee landlordism has sprung up, and a restless, floating landless class is wandering about over vast areas of farming country, shifting their homes from year to year.

In the twenty-five states which produce most of the perishable products, the grain, and the cotton of America, there are 2,5000,000 tenant farmers.

In the last ten years in both Texas and Oklahoma the percentage of increase in tenant farmers over the increase in land owning farmers has been two to one. In the states of Alabama, Arkansas, Tennessee, Georgia, Louisiana, Texas, Mississippi, South Carolina, North Carolina, Missouri, Kentucky, Indiana, Nebraska, Michigan, Wisconsin, Minnesota and California, there has been an actual increase since 1880 of 994,361 tenants, while home owning farmers have increased but 606,755.

In the state of Illinois, Iowa, Kansas, New York, Ohio and Pennsylvania tenant farmers have increased by 121,-167, while the number of home owning farmers has actually decreased by 62,915.

The figures are alarming, and present a grave problem when we consider that out of the 2,354,676 tenant farmers in the United States in 1910, 2,188,586 were found in the twenty-five richest states. The last federal census shows that the percentage of tenant farmers had increased from 25.6 in 1880 to 37 per cent in 1910. In the light of this information, absentee landlordism appears as a menacing problem of nation-wide significance. How to make it possible for the renter to acquire and pay out the farms of the country must surely become a matter for the consideration of statesmen; for it is a question which cannot be determined without the aid of legislation. How immediate is the need of legislation the tenant farmers know. What complications arise are often felt by the whole people.

The shifting tenant is a great menace to the formation of a successful marketing society. The cards of fate also are stacked against his becoming a home owner, under present arrangements for short time purchase at high interest rates. Yet the tendency continues toward a more complete domination by absentee landlords.

How to check this unwholesome tendency, and how to start corrective forces, will be discussed along with other kindred problems by those who take part in the Third National Conference on Marketing and Farm Credits to be held at the Hotel Sherman, Chicago, November 29 to December 2. At the Conference economists, farmers and bankers representing every section of the United States will join in an effort to frame rural credits legislation intended to encourage renters in acquiring farms.

Fortunately, the United States has the experience of European countries to guide it. Indeed, at the coming Chicago conference the story of what co-operation has done for Ireland, is to be told by Sir Horace Plunkett, Dublin, Ireland, founder and president of the Irish Agricultural Organization Society. David Lubin, American delegate to the International Institute of Agriculture, Rome, Italy, will describe continental conditions and constructive programs. Dr. John Lee Coulter, Dean of the College of Agriculture, University of West Virginia, former expert in charge of the United States Federal Agricultural census, will handle this problem of the landless man in its general American aspects. At this meeting also I expect to make my first public report of my investigation of the administration of land purchase systems in Ireland, Scotland and England.

In a majority of cases, the tenant farmer is the left-over man of progress. His business ability and his intelligence are not so great as that of his more prosperous neighbor who owns a farm. But his lesser capital and inferior borrowing power are greater hindrances.

The tenant of the South lives in an unpainted, unsanitary, miserable shack. Poverty and usury force him to a sad and soggy existence. His little children are doomed to the fields with little hope of the future. The whole family toils; and when the year is over they survey their hopeless situation, load their goods into a covered wagon, tie the cow to the back of the wagon and drive to another country to try again. And who can blame them? The family has lived through the year on less than $90 a piece.

This great mass of shifting tenantry constitutes a menace to agricultural prosperity and a chief hindrance to the adequate and distribution of farm products. No device has yet been found equal to organizing them for the business-like marketing of their products —that is no device which will keep them organized.

The conference, November 29 to December 2, will have done a great work if the workers only thresh out that one question—how to turn landless men into land owners.

Charles W. Holman,
Secretary of the National Conference on Marketing and Farm Credits.

International Harvester Machines

Keystone Corn Shellers

THE big point that commends the **Keystone** corn sheller to American farmers is its capacity for clean shelling. It removes trash and dirt from the shelled corn, it shells all the corn, it cracks no kernels, and it scores and breaks no cobs. The **Keystone** is the most economical corn sheller.

The **Keystone** corn sheller is made in 1, 2, 4 and 6-hole sizes, to operate by hand, horse, or engine power. The one-hole pony shellers, in steel and wood styles, find a profitable place on farms of all sizes. The larger shellers are sold, mounted, unmounted, or down, for use on trucks or on barn floor.

Keystone corn shellers are noted for durability as well as clean shelling. You'll make no mistake if you buy a Keystone. See the I H C local dealer who handles them, or drop us a line and we'll send you our booklet, "For Better Crops," containing the opinions of experts on corn raising, and full information about the **Keystone** corn sheller.

LYON'S PRACTICAL FARM PAPERS

We, that is "me," took a contract with myself to put in a couple thousand ears of stalk selected seed corn by or before October 1, besides helping the boys house some 6,000 sticks of tobacco; and while I did not get quite 2,000 ears in by the date set, I have the nicest lot of seed I ever saw.

Somebody got to talking about extra big ears, and I told him that as I planted for a heavy yield of ears above medium size, I did not have many extra size ears; then, again, as the stalk the ear came from, and its position on that stalk cut quite a figure in seed selection, I was not competing with the man who planted two grains in hills four feet apart each way.

The mice got at some of our seed ears, and as I was rehandling some 700 ears the other day when it was raining, I did some measuring and counting. Among the 700 ears I found 25 more than a foot long, 50 eleven inches long, 100 more than ten inches long, the rest ranging down to nine inches, very few being that short, and nine and a half inches is the shortest ear admitted to a show sample of Johnson County White Corn.

In town the other day a man to whom I sold seed in 1913, told me that he had hundreds of ears that were more than fourteen inches long, and I told him that I would take 100 of these at 5 cents an ear, but I am afraid they will never be delivered.

Going over my seed I put aside that which I intend to use next spring and I am not taking all of the largest ears neither am I so very particular about every ear having a perfect tip. Our fair is on this week, Oct. 4-9, and it is said that the large hall will not hold all the produce to come.

October 11—The fair is over, 10,000 persons passing the gates on each of the last two days. The show of corn was especially fine, but my man failed to find many fourteen-inch ears; the largest sample being of six ears, each thirteen inches, and the second largest six ears twelve inches long. I have seen ears that all measure more than thirteen inches.

As I am the officiating judge at our fair, I do not exhibit, but I hung up a sample of fourteen eleven-inch ears for the boys to see, and while there was other good corn at the fair I had them all beaten.

Heard at the Fairs

"Gee whiz! Bill, I have got 100 bushels of corn at home that will beat any I see here."

"Well, well, call them good apples? Why, Sam, we feed bigger apples than them to our hogs."

"Just watch that there corn judge. He put the blue ribbon on Tom Smith's corn, just because Tom paid $4 a bushel for his seed."

"I swear, fairs ain't what they used to be, for forty years ago, when the town was wet, I have seen a dozen fist fights in one day."

"By heck! Joe, let's don't come tomorrow. Let's get on the car and go to the city whar there is something goin' on, and we can git some beer."

Reported just as heard.

C. D. Lyon, Georgetown, Ohio.

The Missouri Farmer

VOLUME VII NOVEMBER 15, 1915 NUMBER 22

The Hour For Action Has Come

By William Hirth, Publisher

Not in years — if ever — have the Packers given a more brutal exhibition of power than several weeks ago when, within the short space of 48 hours, they smashed the price of hogs over one dollar per hundred. That there was neither rhyme, reason nor justification for this sudden upheaval in the hog market of course goes without saying—and it must be said to the credit of the brigands responsible for it that they have made no attempt to explain it. As a matter of fact, the farmers of the United States ought at this time to be enjoying the most substantial and steady prices for hogs and cattle they have known for a long while and were they permitted to reap the benefit of the normal laws of supply and demand this would undoubtedly be true. As Mr. Ellis pointed out in a recent editorial, in the eight months preceding the outbreak of the European war we exported $81,000,000 worth of American meat products while during the first eight months following the war we exported $174,482,000 worth—or an increase of $93,482,000—and since these figures were made public by the Government, many millions have been added to the credit side of our trade balance on meat exports. Does any sane man believe we would be threatened with a range of six to seven cent hog prices if farmers were permitted to reap the benefit of this tremendous increase in the foreign meat demand? When the unusual demand for American guns and cartridges turns Wall Street upside down and precipitates a wild speculation running into the hundreds of millions of dollars, should not the same unusual foreign demand for the products of the American farmer stiffen rather than depress the price of his commodities?

An Unjustifiable Assault

Furthermore, it cannot be explained on the theory that there has been a sudden or unusual decrease in the home consumption of meats because with the great steel plants which are turning out war munitions running at capacity, there is unquestionably a greater demand for labor than we have known for some time—and hence there unquestionably is also an increase rather than a decrease in the demand for meat among our own people.

While it is impossible for the average man to know exactly what is transpiring behind the scenes, to a man up a tree it looks as though the Packers waited until they had the contracts for the winter's European meat supply safely tucked away in their pockets—and then, as soon as the recent loan of $500,000,000 was made available for the Allies, started in by a common signal to hammer down the price of hogs in order that they might buy the winter's meat supply for the European armies who have access to our markets at the lowest possible dollar. That this substantially represents the true state of affairs there is little question—and it all goes to show how helpless the farmer is to protect himself against those who prey upon his sweat and toil under existing conditions. Thousands of farmers in the Corn Belt and elsewhere lost money in their feeding operations last winter and it now looks as though we will be compelled to repeat the performance again this winter—and this in view of the fact that we are in the midst of the greatest foreign demand for American meats we have known in a long while.

Facing a Grave Crisis

As a matter of fact, not one farmer in a thousand realizes how serious the present situation is and how gravely it menaces the future of the average farm home. In short, we have reached a point where the Packers are in practical control of the food products of the Nation. The raising of live stock is the very corner stone of American Agriculture. For years the farm papers and other capable Agricultural authorities have advised the farmer to turn more to live stock farming in order to maintain the fertility of his soil and by this means to obtain a better price for the crops he produces —and yet, squarely in the path of this necessary policy stand these industrial vampires who arbitrarily fix the price which the farmer shall receive for his cattle, hogs and sheep, while on the other hand they fix the price which the millions of American consumers shall pay for meat over the butcher's counter. By fixing the price of hogs and cattle, they automatically fix the price of corn and other feeds which, in the last analysis, must depend upon what the animal brings which consumes them. But this isn't all. In like manner they also dictate the price of Poultry products—eggs, chickens, turkeys, geese, etc., and as evidence of this fact, in nearly every cross-roads town and hamlet in Missouri, as well as in other states, there is a buyer for one of the big Packing concerns and this buyer fixes the price which the local merchants shall be permitted to pay for the Poultry products of that particular community. Likewise, their grip is slowly but surely tightening on their control of the butter situation by means of large centralized creameries which have already forced many small, independent creameries out of business. Only recently the Supreme Court of Missouri fined Swift & Co. $5,000 for its unfair methods of competition in this field—and likewise suspended an ouster shutting the concern out of the state pending its promised good behavior. Ever alert to every phase of the situation, the Packers have been buying up many of the cotton-seed mills in the South in recent years in order that they may be in position to wield a large measure of control over this product which is rapidly becoming a big factor in beef production.

Again, there are few if any more powerful figures in the Wheat Pit than Armour, who it is alleged has been one of the chief agents for the Allies in the filling of foreign wheat contracts—and for years he has been one of the dominant factors in the American wheat situation.

A Great and Vital Issue

Thus, in position to tell the farmer what he shall receive for his cattle, hogs, sheep, poultry and butter and powerful factors in determining the price of his wheat, are not the Packers in practical control of the great essential food products of the Nation and do they not today constitute the gravest menace confronting American Agriculture? On the other hand, do they not equally menace the well-being of the millions who toil in our large cities and who have no appeal from the prices which these influences establish for the things that hold body and soul together? Is not here your real answer to the cry of the "high cost of living" which is everywhere abroad in the land? Can not the farmer present an unassailable "alibi" when he cites the fact that the products which he sells for one dollar cost two dollars by the time they finally reach the table of the consumer? Can there be any greater issue before the American people than the one which seeks to break the strangle hold which these vampires maintain today upon the throat of the farmer and consumer alike? Does it not transcend in importance the question of a greater army or navy? Is it not well to pay some heed to the foes who threaten us from within as well as those who may menace us from without?

Time for Action Here

That the time has come when farmers must organize themselves together and stand shoulder to shoulder as never before is so manifest that it is a mere waste of words to dwell upon it—for the present condition of affairs hangs like a dark pall over the threshold of every farm home in the land and upon its solution depends not merely the future welfare of American Agriculture but that of the millions who toil in shop and factory. Farmers are helpless only because they themselves have consented to be helpless. For years we have followed the blind and foolish policy of "everybody for himself and the Devil take the hindmost." We have boasted of a stupid "independence" which has finally led us into a situation where we are economically bound hand and foot—which is driving thousands of our brightest country boys and girls to the already over-crowded cities with their pitfalls of vice and crime—which is rapidly increasing tenant farmers and decreasing rural population—which is taking the heart and the hope out of farm life because the laborer, however courageous, finally tires when there is

THE GREAT ISSUE

There is and can be no greater issue before the American people than that which seeks to break the strangle-hold of monopoly upon the Nation's foodstuffs—than that which, on the one hand, seeks to emancipate the farmer from a condition of servitude which hangs like a dark cloud across the threshold of every farm home in the land and which, upon the other, levies an unholy tribute upon the things which hold body and soul together for the millions who toil in shop and factory. Monopoly in any sphere where the law of supply and demand should prevail is reprehensible but when it lays its unclean hands upon the things men and women must eat it is damnable—an arch crime against society.

The farmers of the United States—whose calling is the hope of the Republic in the years to come—resemble a sleeping Hercules who is chained and helpless only because he has been indifferent to his latent power and his duty to himself, his loved ones and to society. That the men who produce the Nation's foodstuffs cannot dictate the channels through which these foodstuffs shall pass in reaching the consumer—that once they make up their minds to stand shoulder to shoulder they cannot free themselves from the industrial vampires who now levy their "pound of flesh" upon producer and consumer alike—this thought is as absurd as it is false.

The great crying need of the hour is for a "farm leader" in every school district in this great state—for a farmer with vision and heart and soul who will go to his neighbors and arouse them to the patriotic duty which calls to them through the silent tongues of the fields, barnyard and feed lot. Let us see to it that ere the winter's snows disappear a hundred thousand stalwart, fearless, determined Missouri farmers shall be banded together in a powerful, statewide farmers' organization—and then let us ask the farmers in other states to do likewise and gird on the armor in this great and good fight upon the outcome of which depends not merely the freedom of American Agriculture but the wellbeing of the millions who struggle in the crowded and smoke-begrimed cities.

no reward for his sweat and toil out under a summer's pitiless sun or out in the winter's biting cold.

As the man who feeds and clothes humanity, the farmer is entitled to at least the intelligent production cost of the things he produces—and this he is not receiving at this time nor will he receive it so long as present conditions are permitted to exist. Is there a way out? Is there a remedy? Beyond the slightest question there is, for as we have said before, the farmer is shackled only because he himself has held out his hands while a small coterie of industrial brigands have welded the fetters that bind him. As the producer of the Nation's foodstuffs he has it in his power to say through what channels these foodstuffs shall pass in reaching the consumer—**and here is the key to the whole situation and here is where the blow must be struck which will shake off the strangle hold which monopoly now maintains upon the farmer and the consumer alike!**

Organization—the Only Hope

Suppose that out of the 277,000 farmers in Missouri, 100,000 of them were banded together into a powerful statewide farmers organization and then suppose their efforts were supplemented by a similar organization of 100,000 farmers in Iowa, Kansas, Oklahoma, Nebraska, Illinois and Indiana? Does any one doubt that such an organization comprising 700,000 determined farmers in these seven great Corn Belt states would not almost instantly become a tremendous factor in the present situation and that, acting together, they would constitute a more powerful force than American Agriculture has ever known before—that, standing shoulder to shoulder, they would soon represent a power which could mark out a path of deliverance from the ills which beset us at this time?

The American farmer is a sleeping giant and once he becomes aroused, no set of men, however well intrenched through years of undisputed monopoly, or however resourceful in money, can prevent him from dominating the things which he himself produces and which the toiling millions in the cities must have in order to live and upon which no gang of conscienceless conspirators should be permitted to levy an unholy tribute. But in order to accomplish these ends we must shake off the lethargy which enthralls us. We must quit drifting aimlessly with the current. We must cease to labor merely with our hands. Opposed to us are shrewd, resourceful men who think and act—and so likewise, we must think and act as never before and upon the manner in which we do these things depends the future of the American farm home and that of the little ones who play around our firesides today.

Are You Ready to Act?

Heretofore, the farm organizations scattered here and there have devoted themselves chiefly to social matters and a discussion of farming methods —and while such objects are very necessary and splendid, yet in the present crisis we must have an organization much farther reaching and more serious in its aspirations than this; we must, in short, boldly and fearlessly take in hand the marketing of the things which the farmer produces—and this must be a battle cry to which farmers may rally in every nook and corner of the land. The first essential step is to organize a "Farm Club" in your school district. Call a meeting of the patrons of your district as soon as possible and see how many farmers will agree to become members. We have recently prepared a circular which tells you how to proceed and we will gladly supply copies of it upon request. As soon as 15 or 20 of such clubs have been formed in your county, a county convention of farmers should be called and at this time some strong, alert and progressive farmer should be named as president of the county organization—together with an executive committee of half a dozen good farmers from each township. This will give you the machinery through which your county can be organized from beginning to end—and as soon as 25 or 30 counties have been aroused in this fashion we will be ready to perfect a state organization. Acting upon suggestions contained in recent articles in The Missouri Farmer, many of our readers have already shelled off their coats and many school district "Farm Clubs" have been formed—or are in the process of formation. As soon as the movement is under good headway in your county we will help to supply able speakers who can assist in the final work of organization—but in the meantime there is no reason why farmers should not, of their own volition, come together and agree to organize school district "Farm Clubs" in order that these preliminaries may be out of the way and so that the speakers may take in hand the heavier work which lies ahead of us. There is no time to lose. The hour has struck when we must act. Too long we have been indifferent—and upon the outcome of this great issue depends the future prosperity and happiness of yourself and your loved ones.

Let's see to it that Missouri leads in this great fight in which is involved the emancipation of the American farmer and consumer alike. Before the winter is over, let there be not less than 100,000 Missouri farmers banded together in a great state-wide organization of "Farm Clubs"—and then let's ask the farmers of other states to join in with us. In conclusion, write us at once for literature which will aid you greatly in perfecting a "Farm Club" in your district. The crying need of the hour is for a "farm leader" in every school district in the state—and if you, my friend, are willing to gird on the armor in this great cause, you will find The Missouri Farmer squarely at your back, willing to help and advise with you every step of the way.

Anything to Sell or Buy?

Have you any surplus feeders, hogs, sheep or dairy cows to sell? Or have you some corn, hay or oats which you would like to dispose of to farmers who may be in need of it? Or have you any farm implements in a good state of repair which you can no longer use? Will you have good seed corn, alfalfa, cowpeas, timothy, bluegrass, clover or other good farm seeds for sale? If so, please write the full particulars to The Missouri Farmer at once. On the other hand, if you want to buy any of the above items, if you will let us know, te chances are we can put you in touch with farmers who have them for sale. We often get letters from farmers who want to buy certain things and it is always a pleasure for us to bring buyer and seller together. We are especially anxious to hear from farmers who will have good farm seeds of one kind and another for sale during the coming winter. We have recently heard from one of our subscribers who is in the market for a good span of Percheron brood mares from six to ten years old. So, too, we have had numerous requests from farmers in Southern Missouri who want to buy good dairy cows—so whether you have live stock, feed, seed, farm implements or anything else needed on the farm for sale, write us the full particulars at once.

TO SAVE LOSS IN STORED MANURE

About the most important product of the farm is manure and yet there is possibly less real knowledge about how to handle it so as to get the most value out of it of any other one thing the farmer must handle every day in the year. Manure should be considered the first money crop of the farm because we think that a careful investigation will show that on the average farm where any considerable number of live stock are kept the potential value of the manure produced if used to the best advantage is greater than most any crop marketed. Many farmers who appreciate the importance of saving and applying all the manure produced do not understand what a great loss there is in the present methods of holding the manure before it is spread on the land. Some valuable information is given in the following article from Dr. R. H. Carr, Indiana Experiment Station in the Purdue Agriculturist for November:

"There never has been a time," says Dr. Carr, "when such keen interest in intensive farming and conservation of resources has been shown as the present. Yet many of our farmers are continuing to draw upon the deposits of past ages and to waste manures. The store of available plant food is already insufficient in many soils to meet the requirements of the crops. As we look back and consider those who have made a financial success of farming, we usually find they were the men who conserved all available plant food, with the result that each year their acres yielded a little more than the year before. Many factors played a part in their success, but the important one always was that they guarded their manure from waste about as carefully as their money. Today a well kept manure pile is an indication of a successful farmer. It is not the purpose of this paper to advocate the use of manure as it has been used successfully for more than two thousand years but, rather to emphasize the fact that rapid loss occurs in this valuable farm product and to point out the best methods of preserving it.

Manure Is Very Unstable

"Manure contains a large number of bacteria and molds which cause decomposition to commence as soon as it is produced. It is a difficult matter to check completely the work of these organisms, hence under the most favorable storage conditions the loss may amount to 15% or more of the total nitrogen. This loss, which is greatest in loose piles of manure, is due largely to bacteria, (aerobic) which require free oxygen. They break down the nitrogen in urea, etc., by adding water and thus producing ammonium carbonate which is a very unstable compound and allows the ammonia to escape into the air. The bacteria (anaerobic) in manure which use oxygen in the combined form are not as destructive but are rather useful, producing mainly putrefactive changes in the carbohydrate materials. Thus, when they act on straw, it shows a dark color, shrinks in bulk, the temperature rises somewhat, and it soon becomes a well rotted mass. If the manure is loose and dry, molds tend to develop and cause a loss of nitrogen as well as non-nitrogenous compounds. This is usually evidenced by the white powdery substance which collects, especially on horse manure and is called "fire-fanging." It has been shown that manure stored loosely for 5 months loses 53% of its organic matter and 34% of its nitrogen, while in the same time, well compacted manure loses about 28% of its organic matter and about 15% of its nitrogen. Hence it is important to keep manure wet and well packed to avoid needless waste.

Methods of Preserving Manure

"There is no doubt but that the best place to preserve manure is in the soil, but, since it is not always practicable to haul it out and spread it over the field daily, many different chemical methods have been used in order to check fermentation. The following substances have been found more or less successful: Kainit, gypsum, rock phosphate, acid phosphate, sulphuric acid, salt, etc. Since manure contains only a small amount of phosphorus, it has been found most profitable to reinforce and preserve it with some phosphate, especially acid phosphate. Rock phosphate has also been found to be very efficient when mixed with fresh manure. In a test at the Ohio station the first produced a crop increase equal to four dollars and eighty-eight cents a ton and the latter, four dollars and forty-nine cents a ton. It would seem, therefore, if these figures are correct, that one could hardly afford not to use one of the phosphate compounds on fresh manure.

Storing Manures

"Since it is often impracticable to haul manure to the field daily, various kinds of storage are used to control the loses from leaching and fermentation which seriously affect not only the nitrogen but the phosphorus and potassium as well. The following are the important ones: deep stalls, composting, manure pits and covered yards. In the mind of the writer, the last method seems the most practical, especially when any considerable amount of manure is made. The covered shed protects the manure from the rain, thus preventing the alternate wetting and drying which cause destructive fermentation. The cattle and hogs tramping over it make it compact and moist to the right degree. Thus the shed serves not only to protect the manure from leaching and fermenting, but also the stock from the storms and provides a dry storage place for straw above. The loss of plant food in this method is small, especially if the shed has a cement floor.

Value of Farm Manures

"If we judge the value of manure by its nitrogen, phosphorus and potassium content, averaging 10, 5, and 10 pounds per ton respectively, it would have a market value of about two dollars. But this is not sufficient data on which to base its value as it gives no credit to its physical and bacteriological properties which are about as impotant as the chemical in all but muck soils. A ton of manure will carry about 500 pounds of organic matter which will tend to make more plant food available when it decays in the soil. This amount of organic matter will warm and aerate a clay soil so that its productiveness will be greatly increased over what it would have been by the addition of only the plant food elements contained. The bacteria added in the manure also play an important role, as manured soils have shown much greater production of nitrogen in available form than unmanured soils. This is probably due to the work of millions of bacteria which the manure carried. There is a close relationship between the lower forms of life in the soil and the growth of the higher forms of plants. Hence the value of manure must be considered from a three-fold aspect,

namely, chemical, physical, and bacteriological, each playing an important part, not for one season only but for many years."

THE MISSOURI LAND BANK

The last Legislature passed an act which proposes to create an institution to be known as The Missouri State Land Bank—the said bank to become a part of the State Banking Department and be under the supervision of the State Bank Commissioner at Jefferson City and under the direction of a board of governors comprising the Governor of the state, the Attorney General, Secretary of State, State Treasurer and State Auditor—the said board having the right to adopt such rules and regulations from time to time as are consistent with the act creating the said bank and not in conflict with the laws and constitution of the state. It is further provided that the next Legislature shall appropriate one million dollars as working capital for the above institution. This appropriation is a loan to be paid back out of the reserve fund whenever that fund is sufficiently large.

Powers of the Land Bank. The said Missouri State Land Bank shall have the power to make loans direct to the farmers of the state in amounts not in excess of 50% of the value of the farm lands owned by the borrower on promissory notes secured by a deed of trust in the nature of a first mortgage against the said land.

Sec. 7. The state shall be divided into appraisement districts and the manager shall appoint, subject to the approval of the Board of Governors, expert appraisers in their districts. The salary of appraisers shall be two thousand ($2,000) dollars per annum and expenses. When an application is made for a loan an appraiser shall be designated to make the appraisement of the land offered as security. He shall appraise the land at its cash value and make his report thereof under oath without delay, giving also in said report such information as he may have concerning the applicant and the land as to the desirability of the loan. The applicant must offer an abstract of title which shall be examined by the Prosecuting Attorney and a report made by him in writing, giving his opinion as to the state of the title, which then shall be examined by the Attorney-General and his opinion indorsed thereon. The manager may require any county officer and may ask any bank or trust company located in the county of the applicant's residence to give without charge any information desired relative to the applicant and the loan.

Length of Loans and Amounts. The loans shall run for periods of not less than five years nor more than 25 years and no loan shall be for less than $250 nor for a sum greater than $10,000—and since it is the purpose of the act to develop and improve the largest number of farms possible, the board governing the Land Bank shall give preference to those seeking loans for less than $5,000.

How Money May Be Used. Loans will be offered only to applicants who offer first liens on perfect fee simple titles (from courtesy, dower and homestead exemptions) and in no case shall loans be made for speculative purposes. To this end, money borrowed from the Land Bank may be used only for the following purposes:

1. To increase the production of the land mortgaged.
2. To make useful improvements thereon.
3. To pay off liens or incumbrances or to make part payment of purchase price where the borrower is paying part of the purchase money.
4. Twenty-five per cent of the amount borrowed may be used for the purchase of live stock and machinery.

How Loans Are Paid Back. Borrowers shall have the right to pay off their loans at any interest-paying date to pay annually or semi-annually the amount of interest due together with such an amount of the principal as will result in the amortization of the debt within the period selected to pay off the loan. If, for example, the amount borrowed should be $1000 and the rate of interest 4.3% (four and three-tenths per cent) it would be paid off approximately as follows within the period indicated below:

Annual payment on 5-year basis $224
Annual payment on 10-year basis $124
Annual payment on 15-year basis $ 91
Annual payment on 20-year basis $ 75
Annual payment on 25-year basis $ 65

Suppose we compare the above figures with the ordinary loan at say six per cent interest, and there are few loans made at this rate without a commission charge. A $1000 loan at 6 per cent takes for the interest only $60 a year and at the end of 10 years you have paid out $600 and still owe the debt or $1600 in all as compared with only $1240 paid to extinguish the debt under the Land Bank plan. If it should run for 25 years it takes $60 a year—$1500 to pay the interest and the principal $1000 making $2500 to pay off the debt. But under the Land Bank the payment is $65 a year, only $5 more than the yearly interest and at the end of the time the debt is paid off with a total payment of $1625 or a saving of $875. This shows very clearly what the saving would be aside from the expense and annoyance of renewing the loan every five years as we must do under our present system.

Rate of Interest Charged. The first $500,000 shall be loaned to farmers at the above indicated rate of $4.3%. In addition, there will be an interest charge of one-half of one per cent to defray the expenses incident to conducting the Land Bank—thus bringing the total interest charge up to 4.8% (four and eight-tenths per cent) on the first half million dollars loaned. If it is found that the Land Bank can transact its business for less than the charge of one-half of one per cent, then it shall have the discretionary power to refund to each borrower whose loan has run for at least ten years or whose loan has been paid off in full, such a proportion of the remaining surplus as may belong to the said borrower. In other words, the purpose of the act is that borrowers shall contribute only so much of the one-half of one per cent as is absolutely necessary to create an adequate working capital and to pay the running expenses of the Bank.

Future Interest Charges. As stated above, the first $500,000 will be arbitrarily loaned at 4.8% (this includes the half of one per cent for paying the expenses of the institution). Then the State Bank Commissioner will take the $500,000 worth of farmers' notes which have been deposited with him to secure loans in the above amount and against these notes he will issue debenture bonds—and these debenture bonds he will offer for sale to the investing public and since these bonds will have back of them as collateral first mortgage notes against land appraised at not to exceed 50% of its value and since these bonds will be free from state, county and municipal taxes, it can be seen that they will be an exceedingly attractive investment to those who have surplus funds. Therefore, should the first issue of bonds sell on the basis of four and a quarter per cent interest, the loans made under this series would draw interest at the rate of four and three-quarters per cent—including the one-half of one per cent charged for defraying the expenses of the bank. Should the bonds sell on the basis of four and one-half per cent, the total rate charged would be five per cent, etc. In other words, while the first $500,000 will be arbitrarily loaned at 4.8%, the interest rate on subsequent loans will naturally depend on what the debenture bonds sell for in the open security markets of the country.

Low Interest Rates Assured. That the proposed Land Bank, however, will provide the lowest interest rates the farmers of Missouri have ever known there is not the slightest question for, since the bonds issued against the notes of farmers under the above plan will not only rest upon collateral of the highest character but be exempt from state, county and municipal taxes, they are sure to be greedily sought after by the investing public the moment they are offered for sale—and thus, for the first time, the credit of farmers will have been mobilized in such a way as to make it possible for them to borrow money on the most favorable basis obtainable in the money markets of the Nation. As matters stand now, both the borrower and the holder of the mortgage are compelled to pay taxes and the removal of this double taxation feature alone will possess much attraction to investors. Again, this plan does away with the commissions, etc., which, under the present system, the borrower must pay to loan agents—and that all these features will make the Land Bank bonds a much sought after investment should be apparent at a glance and in consequence, farmers

(Continued on page 9)

Your Bank On The Farm Is Your Barn.

¶ The deposits are live stock and stock feed.

¶ If your barn-bank is insecure, leaky, draughty, cold, inadequate for your needs—it will pay you no interest on deposits, it won't even keep intact the principal you place there.

¶ If you would draw maximum interest from the grain and forage you feed and from the animals you feed them to, the farm bank must be sound and secure—the deposits must be protected.

¶ **You Cannot Afford Poor Farm Buildings**—build a new, substantial barn this year! Build with

Southern Yellow Pine

"The Wood of Service"

the strongest, stiffest, toughest, most durable and dependable moderate-priced wood on the market today. A barn of honest Southern Yellow Pine will give you a lifetime of interest-earning service.

What Size Barn Do You Need?

We can help you there. We have complete working plans of barns of various sizes, for horses, dairy cows, beef stock and general purposes, that we will send you free for the asking. With the plans go lumber bills and estimates, from which your local dealer can quickly figure the exact cost of building. Send for these plans NOW—protect your farm deposits THIS winter. Fill out and mail the attached coupon.

PERMANENT SOIL FERTILITY

The tenant farmer who holds a lease on his land for a year only is not interested farther than to make the biggest possible yield at the least possible expense. But this is true only of the short-lease tenant and is not true of the man who expects to cultivate the same piece of land for several years. For the man then who owns his land or has a long-time tenure we think the question of maintaining soil fertility is the first and last question he should study.

A fertile soil is the foundation of any and all systems of profitable farming and fortunate indeed is the man who owns a farm of naturally fertile land. But whatever may be the natural condition of the land our greatest question is to know how to maintain its fertility.

In discussing soil fertility, Dr. Cyril G. Hopkins of the University of Illinois in a recent article says:

"'Five elements require careful consideration if lands are to be kept fertile. These are potassium, magnesium, calcium, phosphorus, and nitrogen, and every landowner ought to be as well acquainted with these five elements as he is with his five nearest neighbors.' This quotation is taken from Circular 167 of the University of Illinois Agricultural Experiment Station. It is in full harmony with the teaching of that institution during the past fifteen years, and also in harmony with the general practice of soil improvement in Illinois.

The normal soils of Illinois actually contain from 25,000 to 45,000 pounds of potassium per acre in the first 6 2-3 inches, corresponding to two million pounds of soil; while 200 pounds of the most common commercial fertilizer would add less than 4 pounds of potassium to an acre of land.

The Illinois system of permanent fertility does not provide for the purchase of potassium for normal soils, but it does provide for the liberation of potassium from the practically inexhaustible supply in the soil. This liberation is accomplished by the action of decaying organic matter plowed under in the form of farm manure or crop residues, including clover or other legumes.

Only where the soil is positively deficient in potassium susceptible of liberation need potassium be purchased in permanent systems of grain or live-stock farming. Such are some sand soils and most peaty swamp lands. In market gardening and in some other special types of farming, commercial potassium may be rerequired; and on some worn soils especially deficient in decaying organic matter temporary use of kainit often is advisable.

As a general average the normal soils of Illinois contain more than four times as much potassium as magnesium, while the loss by leaching and cropping in rational systems of grain farming or live-stock farming may be greater for magnesium than for potassium, so that magnesium is more likely to become deficient in such soils than is potassium. The calcium supply in normal soil is also only one-fourth that of potassium, while the average loss by cropping and leaching is four times as great; so that 16 to 1 expresses the relative importance of calcium and potassium in the problem of permanent fertility on normal Illinois soil.

All limestones contain calcium; and the dolomitic limestone in the almost measureless deposits of northern Illinois contains both calcium and magnesium in very suitable form both for plant food and for correcting or preventing soil acidity. In the Illinois system of permanent fertility ground natural limestone is applied where needed at the rate of about two tons per acre every four years.

Phosphorus can be purchased, delivered at the farmer's railroad station in Illinois, for about three cents a pound in the form of fine-ground natural rock phosphate; for 10 to 12 cents a pound in steamed bone meal, and for 12 to 15 cents a pound in acid phosphate or in basic slag phosphate.

Phosphorus can be used with profit in any of these forms, but the data thus far secured in comparative experiments indicate that, with equal amounts of money invested, the natural rock phosphate will give the greatest profit in rational permanent systems. At least 1,000 pounds per acre every four years should be applied, and for the first application even two or three tons per acre is not too much phosphate for those who best understand the need and value of phosphorus on normal Illinois land. On soils deficient in decaying organic matter, we advise the use of bone meal, slag phosphate or acid phosphate, rather than rock phosphate.

Rotation with such crops as corn, oats, and clover depletes the soil of all important elements of fertility, and almost results ultimately in land ruin on normal soils, unless some system of restoration is practiced. Clover takes large amounts of calcium and phosphorus from the soil, and the roots and stubble of the clover crop contain no more nitrogen than the clover itself will take from soils of normal productive power.

To increase or maintain the nitrogen and organic matter of the soil is the greatest practical problem in American agriculture. In an hour's time one can spread enough limestone or phosphate on an acre of land to provide for large crops of wheat, corn, oats, and clover for ten or twenty years, while to supply the nitrogen for the same length of time would require from 20 to 40 tons of clover, or from 80 to 160 tons of farm manure, to be added to the same acre of land, even though one of the four crops harvested secures its nitrogen from the air.

To provide nitrogen in the Illinois system of permanent agriculture requires the use of common sense and positive knowledge, the same as with limestone and phosphorus.

For the live-stock farmer on our most common soil, I would suggest a five-field system, a four-year rotation of corn, corn, oats, and clover, being grown upon four fields for five years, while the fifth field is kept in alfalfa. If the straw and half the corn stalks are used for bedding and all other produce for feed, and if 60 per cent of the nitrogen in the manure is used for the production of crops, then a permanent system is provided for the maintenance of nitrogen.

For the farmer who sells grain and hay, wheat may well be substituted for the first corn crop, clover being seeded on the wheat to be plowed under the next year for corn. If only the grain and clover seed and the alfalfa hay are sold, all clover, stalks, and straw being returned to the land, this also provides a system for the permanent maintenance of nitrogen.

While these systems are distinctly for live-stock farming or for grain and hay farming, they should be considered as only suggesting the basis for solving the nitrogen problem; and a combination of these systems in diversified farming will often be preferred to either one alone. The important point is that the landowner should know the essential facts and base his practice upon them in order to provide for permanent fertility.

These statements fairly represent the teaching of the University of Illinois and the practice of progressive farmers in this state."

WHEN NOT TO VACCINATE

The duty of the instructor and demonstrator sent out by the College is not to urge vaccination, but to show the farmers how they can avoid the expense as much as possible. And good service has been rendered in this direction by timely advice to farmers who expected to vaccinate their herds.

When a lot of feeding hogs are about ready for market and an outbreak of hog cholera occurs nearby, it is usually advisable to ship then, if the markets are favorable rather than to vaccinate them and hold them a short period.

There are other occasions when it is neither advisable to vaccinate nor to dispose of the hogs. Farmers have been advised by official bulletins to vaccinate their herds when the disease is within two or three miles of their farms. This is rarely necessary—since the disease can be checked if proper sanitary measures are promptly applied on the infected farms. The efforts should be directed to these rather than to the remote healthy herds.

Those who give such advice have evidently given but little thought what it means in the way of expense and the possibilities for evil, for the advice was also to use the simultaneous method on these farms where the disease had not yet appeared.

There are other good reasons why the farmers should not vaccinate their herds under these circumstances: First, on account of the unnecessary cost. Second, on account of the great probability of spreading the disease to many other parts of that six by six mile district. A third and important reason is that there are better and cheaper ways of eradicating the outbreak and protecting the herds that are even much closer to the infected farm than two or three miles.

A little calculation will show the inadvisability of vaccinating under the conditions mentioned.

Let us suppose that an infected farm lies somewhere near the center of a county. Measurements three miles to the north, east, south and west of the infected farm will cover an area of 36 square miles, or a geographical township, or 36 land measure sections of 640 each. In this state there is an average of five farms to the section, or 180 farms in the township, that is 179 farmers who have healthy herds have been advised not only to vaccinate their hogs because the disease is within two or three miles of their farms, **but they are advised to inject hog cholera germs into their hogs,** along with the anti-hog cholera serum, in order to secure a more lasting immunity.

In any good hog raising county in Missouri the number of hogs raised or fed on the farm runs from 10 to 100 head or more. The average in the hog raising and feeding districts is not less than 25 hogs to the farm, or 4500 to the township. The serum and virus bill, as shown by the official figures from one state that uses the simultaneous method puts the average cost at 60 cents a head, on a half million hogs. But, if we put it at 50 cents per hog taking all sizes into account, the total for a township will be $2250. The veterinary fees of 10 cents per head or $2.50 per farm would add $450 more. If we take into account the shrinkage in a good many of the vaccinated hogs while they are going through the vaccination fever period of 15 to 21 days, and the less profitable use of food during this period, the inadvisability of vaccinating all the hogs in two or three miles of an infected herd is apparent, if a better way to avoid the dangers from hog cholera is available. Some farmers estimate that the shrinkage, and loss of feeding condition will average on a bunch of stock hogs or feeders at least 50 cents per hog, if the loss should be placed at 25 cents, the cost to the whole township with its 4500 hogs would be $1125. A further loss would ensue from deaths following the "simultaneous" vaccination. Over a large territory the losses in individual herds are from zero to more than 90 per cent. The State Veterinarian of Indiana reported in one of the Swine Journals, that one day in a ride of 91 miles visiting sick herds of swine—made sick from simultaneous vaccination—the lowest loss was 12 per cent and the highest was 94 per cent, in herds that were healthy when vaccinated. There were of course many farms that the veterinarian mentioned did not visit and on which the simultaneous vaccination had been used, without hogs dying. But it is probable that some of the hogs on these farms had sufficient fever and diarrhoea to infect the grounds, with hog cholera germs. But if we accept the statements of the advocates of the extensive use of virus, that the general average loss does not exceed 2 per cent to 3 per cent, the total loss in the township under consideration would be 90 to 135 hogs on the 4500 hogs raised. If we place the loss at 100 hogs, of a hundred pounds weight, at 8 cents per pound, the loss would be $800 which is certainly conservative enough.

The total of all these figures is $4525, or something over a dollar a head vaccination tax, that the farmers are advised to pay for the privilege of raising hogs. This would not be so bad if there was any end to this special hog tax. But those who are interested in the sale of serum and virus seek to perpetuate this system. For the system cannot fail to multiply the number of infected farms. And the adjoining townships would soon be taken into the system. And it would continue to spread until the entire county is included. The hog raising couties of this state vary in size from ten to twenty-five geographical townships. The average is fourteen and a half townships. Multiplying the above figures by this factor, the cost to the average county would not be less than sixty-seven thousand dollars, and it would cost the whole state five million dollars or more when the virus system is spread all over the state. The advice to vaccinate when the disease gets two or three miles, while doubtless intended for the benefit of the swine industry, is unwise and harmful; and if followed the serum-virus business would ultimately eat up all the profits of the hog raising business. The better advice was advocated in this series of articles, which makes hog cholera control mainly an incident to better hog farm management, in which inexpensive and effective measures of sanitation and the use of serum alone are included, will in the end be more satisfactory to the swine users.

SUPPLEMENTS FOR CORN FOR FEEDING HOGS

Tankage and Meat Meal.—These two feeds are so closely related that they may be treated under the same head. They are both a refuse product from the packing houses and are very high in protein and therefore require only a small quantity to balance a ration of corn. An average of six feeding trials at the Missouri, Nebraska, Iowa, and Indiana Experiment Stations gave the following results:

Where corn alone was fed the average daily gain was .72 pounds and it required 586.2 pounds of feed to make 100 pounds of gain and the 100 pounds cost $5.23.

With corn and tankage the daily gain was increased to 1.31 pounds and it required only 427.3 pounds of grain to make 100 pounds of gain at a cost of only $4.27.

It will be noted that the gain was increased quite appreciably and that the cost of gain was reduced from $5.25 per 100 pounds in the case of the corn alone to $4.47 per 100 pounds for corn and tankage. The costs are based on corn at 50 cents per bushel and tankage containing 60% protein at $44 per ton. These trials were made with varying amounts of tankage and do not show the maximum effect. It should never be fed in greater amounts than one part of tankage to 9 parts of corn and this only for young hogs. For hogs weighing 125 pounds only about one part of tankage to 12 of corn should be used and large hogs do not require a greater proportion than 1 to 15 and very good results are secured by using only one part of tankage to twenty parts of corn.

The tankage or meat meal can be fed either dry or as a slop. When ground feed is used, it should be mixed and fed with the other feed. When only whole corn is used, the tankage can be fed either dry or as a thin slop. In either case, however, a tight trough is needed because a small leakage represents a large per cent of loss on such a small quantity of feed.

Linseed Oilmeal differs very little from tankage in its effect on hogs. It is not as high in protein, however, and requires about double the amount to produce the same results as could be secured if tankage were used. It is not so high in price and is preferred by many feeders because it is free from the disagreeable odor found in tankage and to some extent in meat meal. A summary of four years' work at Purdue Experiment Station to determine the relative value of tankage and linseed oilmeal is as follows:

When corn meal and tankage were fed together the average daily gain was $3.88 and it required 394.5 pounds of feed. With corn meal and linseed oil meal the average daily gain was 1.49 pounds and the cost of 100 pounds gain was $4.09 and it required 410 pounds of feed for 100 pounds gain.

It will be noted that the gains were somewhat less rapid and the grain required to make 100 pounds gain was more when linseed oilmeal was used and that the cost of making gains with corn at 50 cents per bushel, tankage $45 per ton and linseed oilmeal $36 was $0.21 per 100 pounds cheaper by use of the former feed. There is such little difference, however, that the two feeds are considered of practically the same feeding value. Linseed oilmeal should not be fed in larger amounts than one part of meal to five parts of corn. The proper proportions of oilmeal for hogs of different sizes will be secured by doubling the amount of supplement recommended under tankage. The same method of feeding is employed as when tankage is used.

Shorts or Middlings.—These two by-products of flour mills are so nearly the same in feeding value that they can be considered in the same discussion. They are the most common and abundant of the supplementary feeds for dry lot hog feeding. It requires such a large amount of these feeds to balance a ration of corn that the cost of gains is greater when they are used as the only supplement than when milk, tankage or oilmeal is used. The following results compiled from ten trials at the Missouri and Illinois Experiment Stations gives the effect of adding shorts or middling to corn in dry lot:

Corn alone made daily gain .72 lbs. Corn and shorts made daily gain 1.10 lbs. Corn alone took 586.2 lbs. grain for 100 lbs. gain. Corn and shorts 510.1 lbs. grain for 100 lbs. gain. Corn alone cost $5.23 for 100 lbs. gain. Corn and shorts cost $5.10 for 100 lbs. gain.

It will be noted that the rate of gain was slightly increased and the cost of gain slightly decreased but in the cost the change was not very great. These trials, however, were with hogs weighing about 125 pounds. With pigs, the use of shorts for making a slop especially when mixed with a small amount of tankage or linseed oilmeal gives very much more marked results than when fed to large hogs. In fact, the proper use for shorts in a hog lot is for making a slop for young pigs and as a part of the brood sow ration and also for constituting a part of a slop fed to large fattening hogs when supplemented by other nitrogenous supplements. It adds palatability to a ration of corn and tankage or corn and linseed oilmeal and forms the body of the slop. It may very well constitute one-half of the ration for young pigs but should never constitute more than one-third of the ration for fattening hogs.

F. G. King,
Indiana Experiment Station.

A Good Tonic and Worm Preventive.

The following is a good mixture to keep before the hogs all the time as a tonic and worm preventive: "Sal soda, 3 pounds; Glaubers salts, 3 pounds; copperas, 3 pounds; common salt, 3 pounds; sulphur, 1 pound; charcoal, 4 pounds. Mix thoroughly and keep in a trough in a shed.

LIVE STOCK FARMING

Grain farming reduces the fertility of the soil. Stock farming increases it. Grain farming reduces the humus in the soil. Stock raising increases it. Grain farming spoils the mechanical condition of the soil. Stock farming improves it. Grain farming fosters weeds, plant diseases and insects while stock raising decreases them. Stock raising develops thrift—pay as you go. Grain farming develops the credit system. Grain farming brings on the mortgage. Stock raising pays it off. The labor for grain farming is expensive while that for stock farming is cheaper in that it is engaged by the year. Grain raising is dependent on the season. Stock farming is quite independent of the season. Taking care of stock is splendid training for the boys and girls. People with the instinct for stock raising are and have been the dominant people of the world. Grain farming is a soil robber; hence it is only possible on a new soil and then only for a short time.

The aim of every farmer should be to gradually work into some phase of live stock farming. This results in rotation of crops and a home market for the grain and hay. In this way, as much grain can be grown on the farm as though it were all given to grain, as the yield will be largely due to increased soil fertility, fewer weeds, less plant disease, better mechanical condition of the soil, etc.

The only permanent agriculture is that which is based on live stock farming and permanent agriculture means profitable agriculture.

C. W. Hickman.
Idaho Experiment Station.

WHY AND HOW TO CURE SEED CORN

The first requisite for a good crop of corn is good seed secured from a crop that was grown in your locality. Too often we depend upon imported seed which invariably brings disappointing results for several years.

Seed corn should be selected, as far as is possible and practicable in the district in which it is to be grown, and about a week before the first killing frost is expected. If the corn is fairly well matured a light frost will not hurt the husk covered ears but they should be picked, husked and put to fire drying the day following the frost.

The first test to apply to seed corn is maturity. In the northern part of this state where every day must be utilized for ripening a crop the question of getting seed that has matured in our latitude is of prime importance. We want a corn that will mature nine years out of every ten and this corn can only be secured from our own cornfields by selecting the best matured ears one week before the usual time for the killing frost. We want to raise large corn and get big yields per acre but maturity must not be sacrificed for size.

Having made our selection of about double the amount of corn we expect to plant our task is by no means completed. The ears, if left only over night when the weather is damp, will become covered with molds which will germinate and produce more spores or mold seeds which will become parasites and feed upon the young plants when the seed germinates the following spring.

As soon as the seed corn is picked it must be cured. Many devices have been used for drying seed corn. The most common of these are single string, double string, corn tree, frame covered with chicken wire and boards into which finishing nails have been driven. In the last method the seed ears are jabbed onto the nails. This device has the advantages over the others. It is inexpensive and easily made. When the corn is tested in spring the ears can be numbered very easily by writing the figures on the boards below the ears.

The curing of seed corn is dependent upon two conditions—a free circulation of air and a temperature above freezing until the corn is thoroughly dried. These conditions can best be secured by fire drying. Open the windows in the room in which the corn is stored and build a fire every day until the corn is thoroughly dried. After it has been thoroughly dried freezing will not injure its vitality and if it is kept in a dry place where it will not absorb moisture it will make the best seed corn that you can secure for your farm.—John Klinka, University of Wisconsin.

Keco ENGINES
Gasoline, Kerosene & Gas

Examine this engine at your dealer's before you buy any engine, and especially before you pay more than our prices.

Guaranteed Five Years:-ASK YOUR DEALER

No engine has any more quality for the power-user than ours, no matter what others may claim. Our engines are built to stand hard work, and to prove durable—equal to any. Simple in construction—anyone can understand and easily run them.

Sold on Trial: If your dealer can't supply you, write us, giving dealer's name, and we will send full information, and tell you how to get an engine for trial. Catalog FREE.

The Cow and Her Product

The value of a calf depends on the productiveness of its mother, especially in grade cattle. A calf from a low-producing cow is worth only its beef value, but the higher the dam's production, the higher the premium on the calf.

Milk is the only food found in nature containing all the elements necessary to sustain life. At the same time, if it is not pure, it may cause diseases that end life.

When a cow is fed just enough to maintain her body weight, she can not be expected to give much milk. About half the nutrients in the average ration go to sustain the body. Always feed a full ration.—Clemson College Notes.

THE MISSOURI FARMER

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

Vol. VII November 15, 1915 No. 22.

William Hirth - - - Publisher
Geo. B. Ellis - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year in Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct, always inclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

Who fixes the price paid at the country store for eggs? Not the merchant.

Who fixes the price paid at the station for your cream? Not the local cream buyer.

Who fixes the price paid at the local stock yards for hogs, sheep and cattle? Not the local stock buyer and shipper.

The prices for most food products are fixed by the big packers and they can do so because of the power of their millions filched from both producers and consumers. But what are we farmers going to do about it?

Shall we sit still and do nothing to remedy this evil just because we have been doing so in the past? If we break the shackles our hands are tied with we must use the same methods to some extent the packers have used to get control of the marketing of our products. First, we must stand together and to do that we must have our farmers' clubs organized in every school district in the Corn Belt. We must learn to save the waste and thereby increase our profits. We must co-operate so we can do business on a bigger scale so that our profits will come from the large amount of business rather than large individual profits. The time is right now when every school district in Missouri should have a good working farmers' club.

There is plenty of work to do for a meeting once a week during the winter time and at least once a month during the busy season. The study of better farming, better schools, better roads, better social conditions will all help to hold the organization together while we are working out a plan for better marketing.

REDUCING THE FARM DEBT

We are running in another column of this issue a letter from F. H. Irvin of Benton county which tells a story too familiar to be pleasant to thousands of farmers of Missouri. This farmer says it keeps him working hard six days in the week to pay the 8 per cent interest on a farm mortgage and to donate his share towards making millionaires of the packers.

The remedy for high interest rates is to have the state put into operation some plan of co-operative farm loans as provideed by the Land Bank Bill fully explained on page 5 of this paper. If farmers will charge up as an expense item the value of their own labor and the cost of replacing the fertility of the soil removed by crops, they will find that few farms are making a net profit on the investment of even 5 per cent. Estimating the farm mortgages of this state at $150,000,0000 which is probably below the actual total, farm mortgage indebtedness of Missouri, the yearly saving to the 88,486 farmers who are paying interest if they were borrowing under the Land Bank plan at 4.3 per cent interest plus .5 per cent for expenses, would be $4,800,000 as compared with the rate the Benton County farmer is paying. Compared with a rate of only 6.5 per cent—and few men get money for a less rate when all commissions are counted—there would be a saving of more than $2,500,000.

The most money farmers have made during the last ten years or even twenty years, has been made on increased values of land. In the future we can not possibly hope for such a great rise in land prices and the farmer must look to actual profits from his business.

Statistics prove that both the number of farms operated by tenants and the amount of farm mortgage indebtedness are on the increase and these are serious facts for every man to consider no matter if he does own a debt-free farm. The adoption of an amendment to our state constitution that will make it possible to put the Land Bank Bill into operation will not solve all our difficulties but it will be one long step in the right direction.

The campaign is now on, the petitions are going out to those who are willing to do something to emancipate the farmers of this country from the yoke of the money power. If you are willing to help a little, Mr. Farmer, you can get a blank petition by writing to this office and get your neighbors to sign it. Better do it today.

BE CAREFUL WITH STALK FIELDS

About this time of year reports begin to come in of losses of cattle and horses on account of being pastured in the corn stalk fields and we just want to issue a word of warning to those who will feed their corn stalks in this way. The exact cause of such losses does not seem to be definitely known, even by the best veterinarians, but whatever the cause may be we know that a little precaution may save a lot of loss.

Where cattle and horses can have the run of a good green pasture such as rye, wheat, bluegrass, etc., and are allowed to go into the stalks at will we have never known of loss from corn stalk poisoning. Where the stalks must be pastured off, however, without a run on pasture, or where moldy shock fodder must be fed, it will pay to feed enough laxative feed along with the corn stalks to keep the animals in a thrifty condition. Linseed oil meal, thrashed oats, sheaf oats, bright oats straw are all excellent feeds to go with corn fodder and while the owner may sometimes think it a little expensive to buy these feeds if he does not happen to have any of them, he should know that the money loss of one cow or horse would be enough to buy quite a lot of feed.

Furthermore, these richer feeds given in combination with the corn fodder will ordinarily pay for themselves in the gain and better condition of the animals fed. The man who keeps any kind of live stock will find that it pays to keep them healthy, thrifty and gaining all the time even though he must pay out something for extra feed.

ORGANIZATION AMONG FARMERS

The farm problem has many sides to it and is entirely too big for a man of only one idea to tackle. The farm problem is also too big for one man however great and powerful he may be. All other industries have learned the benefits of organization and co-operation and why not the farmer? The postmasters, the mail carriers, the printers, the barbers—but the list is too long to name—and we do not know of an industry or profession which has not some form of organization for self improvement and mutual benefit except farmers. Why, even the politicians we elect to office band themselves together for their own selfish interests. Unless farmers wake up to the necessity for getting together in clubs for the study of better farming and better marketing they may soon find themselves as hopelessly shackled as the Irish farmers or the Russian peasants have been.

If you have not already done so better write today for our plan of organizing farmers' clubs and for getting better marketing facilities. When writing us just mention any article you may have that you want help in selling or any article you may want to buy in the near future. It may be interesting to you to know how we can help you.

MAKING A SEED CORN CENTER

We have many times pointed out in the columns of The Missouri Farmer the great value it would be to any community or county to build up a good reputation for producing some product for which there is general use. We all realize what the value of a good reputation is to the individual but we have not thought of it as a community asset. If we wanted to buy a bunch of good dairy cows we would naturally turn to some neighborhood where a number of men were raising dairy cows and whose reputation would assure us that we could get good dairy cows in that vicinity and surely those cows would bring a better price than cows not backed by such a guarantee of quality.

There is not a township in Missouri but what could build up a good name for producing some market product if a bunch of farmers would get together and go after the work in some sort of business-like way.

A movement of this kind is being fathered by the farm bureau of Saline County and their first aim is to make that county a great seed corn center. Saline county is naturally one of the best corn counties of the state and if the farmers will generally agree to grow only one variety on a farm or better only one variety in a neighborhood and will adopt the latest methods in corn cultivation, and in seed selection and care, then every bushel of standard Saline county seed corn will find a market at an advanced price.

To start this organization the Saline County Farm Bureau has arranged a Thousand Dollar Corn Contest to be held in Marshall, the county seat, on December 3-4, and have asked the corn growers to make exhibits in ten-bushel lots. The show corn will all be sold after the contest and the money turned into a prize fund. Thus the farmers will finance their own show at very little expense to themselves and if the plan is followed up for a few years it will be worth thousands of dollars to Saline County both in the way of getting a better price for seed corn and in a better general interest in the whole subject of raising good corn. The corn donated will be passed upon by a committee and that of sufficient quality will be sold for seed and by that means a lot of well bred seed corn will be distributed over the county. If the corn raisers of Saline County will co-operate with their farm bureau and follow the plan persistently for a few years Saline County can become the great seed corn center of the state.

Along the same general plan any county in Missouri could in a very short time become the center for breeding good horses, cattle, sheep or hogs. About the first benefit from such an organization would be the stimulation for closer investigation and a more intimate knowledge of the class of stock being bred which would come most naturally from rivalry among members. Not only would such a movement in any county add quality and value to the stock produced but it would aid in the economical production of the stock because of the larger use of high class sires that could be made under such a plan.

The work of starting a seed corn club or a breeding club for live stock is not dependent on a county farm bureau and in counties where there is no such organization or where the bureau fails to see the value of such work it might well be one of the first things to be taken up by a district farmers' club in any neighborhood in Missouri. If any of our readers are interested we will gladly help them by giving suggestions for such an organization. If we can handle these small organizations successfully it will help us in the handling of bigger problems.

SOME NEW BOOKS

Productive Feeding of Farm Animals is a new book by Dr. F. W. Wool, University of California, written for students in agricultural schools and colleges as well as for practical farmers. In this book you will find the latest and best experience on feeding all types of farm animals as well as a discussion of all kinds of feeds—the composition of feed stuffs, feeds, the balancing of rations, etc. Published by J. B. Lippincott Company, Philadelphia.

Productive Poultry Husbandry by Harry B. Lewis of the New Jersey Agricultural College treats a subject that is of much greater importance than most people realize. In a very practical way this book gives information on shipping, feeding, breeding, housing, marketing, etc. Published by J. B. Lippincott & Company.

Productive Orcharding by Fred C. Sears of the Kansas State Agricultural College is a thorough treatise on growing and marketing fruit. The kind of soil, the variety suited to the section, methods of planting, pruning and cultivation are leading subjects. Spraying is given the attention it deserves as well as picking, storing, packing and marketing. Published by J. B. Lippincott Company, Philadelphia.

Productive Vegetable Growing by John W. Lloyd, University of Illinois, has been prepared to give vegetable growers of the Corn Belt a useful guide to the underlying principles of growing all the principal vegetable crops and information about harvesting, storing and marketing. A good book for vegetable growers of the Central West. Published by J. B. Lippincott Company, Philadelphia.

"Productive Horse Husbandry" is one of the best books we have seen on the subject. The author is Carl W. Gay of the University of Pennsylvania and in his own words, "This book is intended to present to students of live stock husbandry the same systematic and complete study of the horse that has been accorded the other classes of live stock." We find this a very complete text and will be useful to any young farmer who wants to handle horses in a really intelligent way. Published by J. B. Lippincott Company, Philadelphia.

THE MISSOURI LAND BANK

(Continued from page 5)

will receive the benefit of the low interest rates which will naturally result.

Longer Time Loans. Not only will the new plan afford farmers a lower interest rate than they have ever known before, but the fact that borrowers have the right to pay the interest and a small part of the principal in equal annual installments running from 5 to 25 years, gives them plenty of time in which to liquidate their loans without hardship or embarrassment. While the present rates of interest which farmers are compelled to pay are excessively high, yet equally burdensome is the short duration of the average present-day loan which gives farmers no opportunity to develop their farms to a stable and paying basis.

Default of Payment. The State Bank Commissioner shall be named as trustee in all deeds of trust given to secure loans and in the event of default of payment necessitating foreclosure, he shall have the power to sell the land in question—or at his request the sheriff of the county in which the land is located may be required to officiate in this capacity.

Will Bring Money Into State. That the Land Bank bonds offered under this act will, in time, bring millions of dollars of outside capital into Missouri there is little question for their undisputable collateral and freedom from taxation will unquestionably make them stand out as the most desirable forms of investment in the Nation.

Is the Land Bank Assured?. By no means. Before it can become an established fact an Amendment to the State Constitution, exempting the Land Bank debenture bonds from state, county and municipal txaes will have to be adopted at the November election in 1916 **and this Amendment must receive a majority of the votes cast for or against it at the above election!**

How Can Farmers Assure Its Enactment? First, by arousing the farmers of every community in the state to the true significance of this great act which means more to them than any other measure ever passed in the history of the state. Second, by seeing to it that every farmer in your community signs a Land Bank petition. Third, by asking your friends and the business men in the nearby towns to help you out in this great fight which means so much for the future Agricultural prosperity of Missouri by giving them an opportunity to sign a Land Bank petition—for the vote of a man in town will count just as much as the vote of a farmer.

A Danger to Be Feared. One danger to be feared is that a multiplicity of amendments may be offered and that, as in past elections, there will be a clash of conflicting interests which will cause thousands of men to vote against all Amendment offered. For this reason, farmers should be careful in signing petitions for other Amendments which might endanger the adoption of this one in which they are so vitally interested.

By writing to the office of The Missouri Farmer we will be glad to send you a Land Bank petition for circulation in your community. Along with it we will also send our circular telling you how to orgnaize a "Farm Club" in your school district—for such an organization will more easily enable your community to present a solid front on this great issue which means so much to the farmers of this state.

BUCKSHOT BY THE PROFESSOR

It always did make me sore to see a little two by four congressman or other official dignitary swell up with imagined importance like a poisoned pup. A public office is no bigger than the man who fills it.

Why don't you and your neighbors get together and organize a school district "Farm Club?" Write in to the editor and have him send you full particulars as to how to proceed. It's time to do something.

Ordinarily I am not very strong for woman's suffrage—but when I see some drygoods box mechanic shift his cud of long green to the other cheek and hear him say that "wimmin ain't got sense enuf to vote," I come mighty near going over to the Petticoat Brigade boots and saddles.

If you are going to have any good Seed Corn, Oats, Alfalfa, Timothy, Clover, Cowpeas, Soybeans, Bluegrass or other farm seeds for sale this winter, write to the editor of this paper about it at once. He receives a lot of inquiries about farm seed from time to time and he will be glad to tell you where you can sell any good seed you may have for sale.

I notice where the big meat packers held a banquet in St. Louis some days ago and the stuff they ate and drank cost $20 a plate. In the meantime, the poor devil of a farmer who raises the hogs which they buy at their own price goes to the "Greasy Spoon" restaurant and pays a quarter—and thanks the good Lord that he has the price.

I met a farmer the other day who said he didn't know whether he was in favor of the Land Bank bill or not. Well, all I've got to say is that the probate judge in this fellow's county is neglecting his official duty. The chances are he spends his time shooting quail and hunting rabbits while he ought to be appointing guardians for people who are not capable of looking after their own interests.

Now don't commence to knock. You don't have to read about that White House wedding if you don't want to. There's nothing to hinder you from filling up on "Old Whiskers" proclamations down in Mexico or gorging yourself with the startling information the Dutch exploded a can of gasoline for the English over in Belgium day before yesterday. Just because people have made up their minds to get married and the newspapers print a lot of stuff about it is no reason why you should develop an ingrowing grouch.

Looks Mighty Good to Me

The Missouri Farmer:

I have just been reading The Missouri Farmer for November 1 and I am enclosing a stamped envelop for your plan of organization. I gather by reading through the paper that you intend to organize the school districts as units and then a county organization and then one for the state. This looks mighty good to me and with The Missouri Farmer as the official organ wonders could be done. We had a good Farmers' Club here for a while but we were alone and after we raised a crop again and did not have to buy feed again the interest waned. One farmer can not do much. One club acting independently can not do much but a federation of clubs all on the same plan will win in time.

I am reminded of the story in our old reader about the man that had several sons and thinking himself not long for this world he called his sons, who were not agreeing among themselves, to him, and handed them a bundle of sticks tied together and asked them to break them, in this they all failed. Then he took them, untied the strings that bound them and taking the sticks one at a time broke them all. Why would not a bundle of sticks be a good emblem or badge for the club?

Really I did not expect to take so much of your time, but I am wound up. I am ready to circulate the Land Bank petition in my neighborhood as soon as received. J. B. Johnston,
Barton County.

Co-operation a Crying Necessity

The Missouri Farmer:

Replying to your very, very able editorial, "Who Fixes the Price" in the issue of November 1st, will say that I am anxious to learn the plan you suggest through the best of all farm papers, The Missouri Farmer.

It don't take much of a philosopher to know that farm co-operation is becoming a crying necessity and if there is anything I can do in this locality to bring it about I am at your service.

Please send particulars in inclosed envelope and oblige. Appreciating the splendid stand you have taken in this as well as other farm problems I beg to remain, Gust. Spaht,
Gentry County.

The Land Bank the Best Thing

The Missouri Farmer:

I think a little merited praise is appreciated by most all of us and in this connection I want to say that your efforts in behalf of the farmers of Missouri are highly meritorious and worthy the support and appreciation of us farmers. We are regular readers of several papers and we think The Missouri Farmer the best of them all for you are always supporting every movement that is in the interest of the farmer.

In a recent issue you ask, 'If anyone has made a dirt road with the plow and drag?" I have made a good dirt road with nothing but the drag and it is on a stretch of road where the water stood 8 inches deep before.

Send me some Land Bank petitions to circulate. I have little time for I have to work hard six days every week to help make millionaires out of the packers and to pay 8 per cent interest on a farm mortgage, but if you will send me a blank petition I will try to find a little time to get signatures. I think it is the best thing now offered us and I am for it first, last and all the time. We are also heartily in favor of your plan of organization. It is time we farmers were getting together and looking after our own interests or they will soon have us where we will have to work seven days in the week to satisfy their greed. Wake up, brother farmers, and let us stand by the editors of The Missouri Farmer in this fight they are making.
E. H. Irvin, Benton County.

WATER WORKS $37.80
For Country Homes

Complete and ready for use, anyone can set up. Complete system, enabling you to have hot and cold running water, sanitary plumbing.
HEATING PLANTS easily installed by anyone at low cost.
FREE Write today for big FREE BOOK of Plans and complete Catalogue. Explains how we supply you at **factory cost** and guarantee you can install or money refunded. Thousands of happy users. Get our low prices on **pumps, engines, washing machines, tanks, plumbing goods, all farm machinery.**

I'll Rid Your Stock of WORMS
I'll Prove It Before You Pay

Hog Stunted by Worms

I have done it for thousands of farmers and stockmen—I am doing it every day—I'll do it for you. All I ask is the privilege of sending you enough SAL-VET to last all your stock 60 days. If it doesn't do what I claim, I'll gladly cancel the charge. Don't stand by and let worms kill off your pigs and lambs. Don't let your hogs and sheep contract diseases and die. Don't let your horses and cattle continue gaunt and thin-looking as if fed on straw. Get rid of the blood-sucking worms that are stealing your feed and eating up your profits, and even sapping your animals' lives away. I'll rid your stock of these dangerous parasites—I'll do it quick if you'll just fill out the coupon below and mail it to me today.

Look Out for Worms!
Don't let stomach and intestinal worms kill off your lambs and pigs this year. Get the best of these deadly pests before they get the best of you. Now is the time to deal them a death-blow. Don't wait until they multiply by the hundreds — until your lambs and pigs are being eaten up alive. Accept my liberal offer; send the coupon today. Let me rid your stock of worms before you risk a penny. Read this letter:
"My lambs were so sick with worms they could hardly walk. One of them was nearly dead. I never expected it would live. After feeding them SAL-VET they got better and are all well and lively now."
S. Y. THORNTON,
Blackwater, Mo.

Lamb Afflicted With Worms

TRADE MARK
SAL-VET
REG. U.S. PAT. OFF.
The Great Worm Destroyer — *The Great Live Stock Conditioner*

SAL-VET is a god-send to every stock raiser. Being a medicated salt, (without Antimony) farm animals take it readily and thus doctor themselves. It requires no dosing—no drenching—no starving—no bother at all. It destroys the parasites that cause 90 per cent of all live stock diseases—improves the digestion and makes all farm animals do better, keep healthier and gain faster on no more feed.

Send No Money—Just the Coupon
Just fill out the coupon—tell me how many head of stock you have and I will ship you enough to last all your stock 60 days. You pay the freight charges when it arrives and feed it according to directions. If SAL-VET does not do what I claim and you make a specific report in 60 days, I'll cancel the charge, you won't owe me a penny.

The Plunderer

By ROY NORTON

Author of "The Garden of Fate"

Dick went to his bed with a critical admission of the truth, and from any angle it appeared foolish. How had it all happened? He was not prone to be easy of heart. He had known the light, fleeting loves of boyhood, and could laugh at them; but they had been different to this. And it had come on him at a time when everything was at stake, and when his undivided thoughts and attention should have been centered on the Croix d'Or. He reviewed his situation, and scarcely knew why he had drifted into it, unless it had been through a desire to talk to some one who knew, as he knew, all that old life from which he had been, and would forever be, parted.

Not that he regretted its easy scramble, and its plethora of civilized concomitants; for he loved the mountains, the streams, the open forests, and the physical struggles of the wild places; but—and he gave over reasoning, and knew that it was because of the charm of Miss Presby herself, and that he wanted her, and had hoped unconsciously. Sternly arraigning himself, he knew that he had no groundwork to hope, and nothing to offer, just then; that he must first win with the Croix d'Or, and that it was his first duty to win with that, and justify the confidence of the kindly old Sloan who had backed him with hard dollars.

He had not appreciated how much the daily meeting of Miss Presby meant to him until, on the following morning, and acting on his hardly reached solution of the night before, he went up for what might be the last time. It was difficult to realize that the short summer of the altitudes was there in its splendid growth, and that it had opened before his unobserving eyes, passed from the tender green of spring to the deep-shaded depths of maturity, and that the wild flowers that carpeted the open slopes had made way for roses. Even the cross on the peak was different, and it came to him that he had not observed it in the weeks he had been climbing to the slope, but had always waited eagerly for the light of a woman's face.

She came cantering up the trail, and waved a gay hand at him as she rounded the bend in the crag. There was a frank expectancy in her face—the expectancy of a pleasant hour's visit with a good comrade. He wondered, vaguely and with new scrutiny, if that were not all—just friendliness. They talked of nothing; but his usual bantering tone was gone, and, quick to observe, she divined that there had come to him a subtle change, not without perturbation.

"You don't seem talkative today," she accused as he stood up, preparatory to going. "Have you finished work on your pipe line?"

He flushed slightly under the bronze of his face at the question, it being thus brought home to him that he had used it as a pretext for continuing their meetings for more than two weeks after that task was completed and the pipemen scattered—perhaps working in some subway in New York by that time.

"Yes," he said, "the work is finished. I shall not come up here again unless it is for the sole purpose of seeing you."

There was something in his tone that caused her to glance up at him and there was that in his eyes, on his face, in his bearing of restraint, that caused her to look around again, as if to escape, and hastily begin donning her gloves. She pulled the fingers, though they fitted loosely, as if she had difficulty with them—even as though they were tight gloves of kid, and said: "Well, you might do that, sometimes—when you have time; but you mustn't neglect your work. I come here because it is my favorite ride. You must not come merely to talk to me when there are other duties."

"Yes," he said, endeavoring to appear unconcerned. "The Croix d'Or is apt to be a most insistent tyrant."

"And it should come first!" He was obtuse for the instant in his worriment, and did not catch the subtle shade of bitterness in which she spoke.

She tugged at the reins of her horse, and the animal reluctantly tore loose a last mouthful of the succulent grass growing under the moisture and shadow of the big steel pipe, and stood expectantly waiting for her to mount. She was in the saddle before Dick could come around to her side to assist her. He made a last desperate compromise, finding an excuse.

"When I feel that I must see you, because you are such a good little adviser, I shall come back here," he said, "morning after morning, in the hope of seeing you and unburdening my disgruntlement."

She laughed, as if it were a joke.

"I'm afraid I'm not a very good miner," she said, "although I suppose I ought to be a yellow-legged expert, having been brought up somewhere within sound of the stamps all my life. Good luck to you. Good-by."

His reply was almost a mumble, and the black horse started down the trail. He watched her, with a sinking, hungry heart. Just as the crag was almost abreast of her mount, she turned and called back: "Oh, I forgot to say that I shall probably come here almost every day."

He did not understand, until long afterward, the effort that speech cost her; nor did he know ever that her face was suffused when her horse, startled, sprang out of sight at the touch of her spurs. He did not know, as he stood there, wishing that he had called her back, that she was riding recklessly down the road, hurt, and yet inclined to be strangely happy over that parting and all it had confessed. With a set face, as if a whole fabric of dreams had been wrenched from his life, the miner turned and walked slowly over the trail, worn by his own feet, which led him back to the Croix d'Or, and the struggle with the stubborn rock.

As he topped the hill he suddenly listened, and his steps quickened. From below a new sound had been added to the melody of the hills; a new note, grumbling and roaring, insistent and strong. Its message was plain. The mill of the Cross was running again for the first time in years; and, even as he looked down on the red roof, the whistle in the engine-house gave a series of cheerful toots in salute of the fact.

Down on the flat in front of the long structure which held, in its batteries, almost two-score stamps, a tall figure came out, and looked around as if seeking him, and then, casting its eyes upward, beheld him, and lifted a battered hat and swung it overhead. It was Bill, rejoicing in his work.

A car of ore slid along the tramway, with the carboy dangling one leg over the back end while steadying himself by the controller, as if he had been thus occupied for years. Dick tore his hat off, threw it in the air, and shouted, and raced down the hill. From now on it must be work; unless they met with great success—then—he dared not stop to think of what then.

He hastened on down to the mill and entered the door. Everything about it, from the dumping of the cars sixty feet above, the wrench of the crushers breaking the ore into smaller fragments, the clash of the screens as it came on down to the stamps, and their terrific "jiggerty-jig-jig," roared, throbbed, and trembled. Every timber in the structure seemed to keep pace with that resistless shaking as the tables slid to and fro, dripping from the water percolating at their heads, to distribute the fine silt of crushed, muddy ore evenly over the plates in the steady downward slant. Already the bright plates of copper, coated with quicksilver, were catching, retaining, amalgamating the gold.

"The veneers need a little more slant, don't you think?" bellowed his partner, with his hands cupped and held close against Dick's ear in the effort to make himself heard in that pandemonium where millmen worked the shift through without attempting to speak.

In the critical calculation of the professional miner, Dick forgot all other affairs, and leaned down to see the run of water. He nodded his head, beckoned to the mill boss, and by well-known signs indicated his wish. He scrambled above and studied the pulp, slipping it through his fingers and feeling its fineness, and speculating whether or not they would be troubled with any solution of lead that would render the milling difficult and slime the plates so that the gold would escape to go roistering down the creek with waste water. It did feel very slippery, and he was reassured. He was eager to get to the assay-house and make his first assay of "tailings," refuse from the mill, to discover what percentage of gold they were saving, and, in parlance, "How she would run on mill test."

Fascinated in his inspection and direction of certain minor changes, he was astonished when the noise suddenly dropped from fortissimo to a dull whine, as the mill slowed down to a stop for the noon hour. And the afternoon passed as quickly while he worked over the bucking board—a plate used to crush ore for assaying—in the assay-house, and watched the gasoline flare and fume in his furnaces to bring the little cupels, with their mass of powdered, weighed, and numbered samples, to a molten state. He took them out with his tongs, watched them cool, and weighed, on the scales that could tell the weight of a lead pencil mark on a sheet of paper, the residue of gold, thus making his computations. He was not pleased with the result. The green lead was not as rich as they had believed.

"It won't pay more than fifty cents a ton with the best milling we can do," he said to Bill, who came eagerly into the assay office.

"But you know the old idea—that she gets richer as we go down?" his partner asserted. "If it pays fifty cents a ton at the mill plates, we'll open up the face of the ledge and put on a day and night shift. We can handle a heap of ore with this plant. It begins to look to me as if the Cross is all to the good. Come on. Let's go down to the power-house and see how things look down there when we're working."

They had been contemplating a new timber road, and, after visiting the power plant and finding it trim, and throbbing with its new life, they cut across and debouched into the public road leading up the canon, by the banks of the stream, to the Rattler. When almost at the fork, where their own road branched off and crossed the stream to begin its steep little climb up to the Croix d'Or, they saw a man standing on the apron of the bridge, and apparently listening to the roar of their mill. His back was toward them, and seemingly he was so absorbed in the sounds of industry from above that he did not hear them approach until their feet struck the first planks leading to the heavy log structure. He turned his head slowly toward them, and they recognized him as Bully Presby. It was the first time either of them had seen him since the evening in the camp.

"So you're running, eh?" he asked Dick without any preliminary courtesy.

"Yes, we started the mill today."

"On ore, or waste?" There was a sneer in his question which caused Dick to stiffen a trifle; and Bill frowned, as if the question carried an insult.

Still the younger man was inclined to avoid words.

"Naturally, we shouldn't put waste through the mill," he said coldly. "We have opened up an old vein which the other managers did not seem to think worth while."

"And so, I suppose, showing superior knowledge, you will demonstrate that the men before you were a set of dubs? Humph! From babes and fools come wisdom!"

His voice was hard and cynical, and his grim lips curled with a slightly contemptuous twitch. The hot, impulsive streak in Dick leaped upward. His eyes were angry when he answered.

"If you apply the latter to me," he retorted hotly, "you are going pretty far. I don't know what business it is of yours. We have never asked you for any advice, and we don't want any. I expect no favors from any one, and if I did, am certain, in view of your attitude, that I shouldn't ask them from you."

"Steady! Steady, boy!" admonished his partner's drawling voice at his side. Dick did not utter other words that were surging to his tongue, and finished with an angry shrug of his shoulders.

Bill turned cooly to the owner of the Rattler, and appeared to probe him with his eyes; and his stare was returned with one as searching as his own.

"Who are you?" Presby asked, as if the big miner were some man he had not noticed before.

"Me? My name's Mathews. I'm The miners' union stirred up by that answered, as calmly as if the form of question had been ignored.

"And I suppose the young Mister Townsend relies on you for advice, and that he——"

"He don't need to rely on any one for advice," interrupted the soft, repressed voice. "I rely on him. He knows more than I do. And say," he added, taking a step toward Bully Presby, and suddenly appearing to concentrate himself with all his muscles flexed as if for action, "I've mined for thirty-five years. And I've met some miners. And I've never met one who had as little decency for the men on the next claim, or such bullying ways as you've got."

Presby's face did not change in the least, nor did he shift his eyes. There was an instant's pause, and he showed no inclination to speak.

"'Most every one around these diggings seems to be kind of buffaloed by you," Bill added; "but I sort of reckon we ain't like them. I'm handin' it to you right straight, so you and me won't have any trouble after this, because if we do—well, we'd have to find out which was the better man."

Bully Presby's eyes flashed a singular look. It seemed as if they carried something of approval, and at the same time a longing to test the question of physical superiority. And then, abruptly, he laughed. Astonished by this strange, complex character, Bill relaxed, and turned toward his partner. Dick, seeing that the interview was ended, as far as the necessity for saying anything was concerned, moved across the bridge, and Bill took a last hard stare at the mine owner. He laughed again, with his cold, cynical rumble.

"I think," he said, "that when the Cross shuts down for good, I'd like to give you a job. When it does, come and see me."

Without another word, or sign of interest, he turned his back on them, and marched up the hill toward the Rattler.

CHAPTER X

TROUBLE STALKS ABROAD

August had come, with its broiling heat at midday and its chill at night, when the snow, perpetual on the peaks, sent its cold breezes downward to the gulches below. Here and there the grass was dying. The lines on Dick's brows had become visible; and even Mathews' resolute sanguinity was being tested to the utmost. The green lead was barely paying expenses. There had come no justification for a night shift, and use of all the batteries of the mill, for the ledge of ore was gradually, but certainly, narrowing to a point where it must eventually pinch out.

Five times, in as many weeks, Dick had crossed the hill and waited for Miss Presby. Twice he had been bitterly disappointed, and three times she had cantered around to meet him. Their first meeting had been constrained. He felt that it was due to his own bald discovery that he wanted her more than anything in life, and was debarred from telling her so. In the second meeting she had been the good comrade, and interested, palpably, in the developments at the Croix d'Or.

"You should sink, I believe," she had said hesitatingly, as if with a delicate fear that she was usurping his position. "I know this district very well, indeed; and there isn't a mine along this range that has paid until it had gone the depth. Do I talk like a miner?"

She laughed, in cheerful careless-

ness as if his worries meant but little to her.

"You see, I've heard so much of mines and mining, although my father seldom talks of them to me, that I know the geological formation and history of this district like a real miner. I played with nothing but miners' children from the time I was so high, pigtails and pinafores, until I was this big, short skirts and frocks."

She indicated the progressive stages of her growth with her riding crop, as if seeing herself in those younger years.

"Then my father sent me to an aunt, in New York, with instructions that I was to be taught something, and to be a lady. I believe I used to eat with my knife when I first went to her home."

She leaned back and laughed until the tears welled into her eyes.

"She was a Spartan lady. She cured me of it by rapping my knuckles with the handle of a silver-plated knife. My, how it hurt! I feel it yet! I wonder that they were not enlarged by her repeated admonitions."

Dick looked at them as she held them reminiscently before her, and had an almost irresistible desire to seize and crush the long, slender, white fingers in his own. But the end of the meeting had been commonplace, and they had parted again without treading on embarrasing ground.

Dick had heard no more from the owner of the Rattler, save indirectly, nor met him since the strained passage of the bridge; but mess-house gossip, creeping through old Bells, who recognized no superiors, and calmly clumped into the owner's quarters whenever he felt inclined, said that the neighboring mine was prodigiously prosperous.

"I heard down in Goldpan," he squeaked one night, "that Wells Fargo takes out five or six bars of bullion for him every mill clean-up. And you can bet none of it ever gets away from that old stiff."

"But how does this news leak out?" Dick asked, wondering at such a tale, when millmen and miners were distinguished for keeping inviolate the secrets of the property on which they worked.

"Wells Fargo," the engineer answered. "None of the boys would say anything. He pays top wages and hires good men. Got to hand that to him. He brags there ain't no man so high-priced that he can't make money off'n him—Bully Presby does. And they ain't no better miner than him on earth. He can smell pay ore a mile underground—Bully Presby can."

The old man suddenly looked at the superintendent, and said: "Say, Bill, You been down to the camp a few times, ain't you?"

"Yes, we've been down there several times. Why?"

"Well, I suppose you know they's a lot of talk goin' around that the Cross is workin' in good pay now?"

"Oh, I've heard it; but don't pay any attention when it's not so."

Bells Park leaned farther over, and lowered his shrill, garrulous voice to a thin murmur.

"Well, I cain't tell you what it is, but I want to give you the right lead. When that gets to goin' on about newcomers in the Blue Mountains—fellers like you be—look out for storms."

"Go on! You're full of stuff again!" Bill gibed, with his hearty laugh. "If we'd litsened to all the mysterious warnin's you've handed us since we came up here, Bells, we'd been like a dog chasin' his tail around when it happened to be bit off down to the rump and no place to get hold of. Better look out! Humph!"

The old engineer got up in one of his tantrums, fairly screamed with rage, threatened to leave as soon as he could get another job, and then tramped down the hill to the cabin he occupied with the other engineer. But that was not new, either, for he had made the same threat at leat a half-dozen times, and yet the men from the Coeur d'Alenes knew that nothing could drive him away but dismissal.

It was but two or three days later that the partners, coming from the assay-house to the mess late, discovered a stranger talking to the men outside under the shade of a great clump of tamaracks that nestled at the foot of a slope. They passed in and sat down at their table, wondering who the visitor could be. The cook's helper, a mute, served them, and they were alone when they were attracted by a shrill, soft hiss from the window. They looked, and saw Bells Park. Nothing but his head, cap-crowned, was visible as he stood on tiptoe to reach the opening.

"I told you to look out," he said warningly. "Old Mister Trouble's come. Don't give anything. Stand pat. A walkin' delegate from Denver's here. God knows why. Look out."

His head disappeared as if it were a jac-in-the-box, shut down; and the partners paused with anxious eyes and waited for him to reappear. Dick jumped to his feet and walked across to the window. No one was in sight. He went to the farther end of the mess-house and peered through a corner of the nearest pane. Out under the tamaracks the stranger was orating, and punctuating his remarks with a finger tapping in a palm. His words were not audible; but Dick saw that he was at least receiving attention. He returned to the table, and told Bill what he had seen. The latter was perturbed.

"It looks as if we were goin' to have an argument, don't it?" he asked, voicing his perplexity.

"But about what?" Dick insisted. "We pay the union scale, and, while I dont' know, I believe there isn't a man on the cross that hasn't a card."

"Well," replied his partner, "we'll soon see. Finished?"

As they walked to the office, men began to hurry across the gulch toward the hoist, others toward the mill, and by the time they were in their cabin the whistle blew. It was but a minute later that they heard someone striding over the porch, and the man they assumed to be the walking delegate entered. He was not of the usual stamp, but appeared intent on his errand. Save for a certain air of craftiness, he was representative and intelligent. He was quietly dressed, and gave the distinct impression that he had come up from the mines, and had known a hammer and drill—a typical "hard-rock man."

"Gentlemen," he said, "I am representing the Consolidated Miners' Association."

He drew a neat card from a leather case in his pocket, and presented it, and was asked to seat himself.

"What can we do for you?" Dick asked, wasting no time on words.

"I suppose this mine is fair?"

"Yes. It is straight, as far as I know."

"It has no agreement."

"But we are ready to sign one whenever it is presented."

The delegate drew a worn wallet from his pocket, extracted a paper, and tendered it.

"I anticipated no trouble," he said, but without smiling or giving any sign of satisfaction. "Would you mind looking that over, and seeing if it meets with your approval?"

Dick stepped to the high desk at the side of the room which he had been utilizing as a drawing board, laid the sheet out, and began reading it, while Bill stood up and scanned it across his shoulders. Bill suddenly put a stubby finger on a clause and mumbled: "That's not right."

Dick slowly read it; and, before he had completed the involved wording, the finger again clapped down at another section. "Nor that. Don't stand for it!"

"What do you want, anyhow?" Bill demanded, swinging round and facing the delegate.

The latter looked at him coolly and exasperatingly for a moment, then said: "What position do you occupy here, my man?"

Dick whirled as if he had been struck from behind.

"What position does he occupy? He is my superintendent, and my friend. Anything he objects to, or sanctions, I object to ,or agree with. Anything he says, I'll back up. Now I'll let him do the talking."

The delegate calmly flicked the ash from a cigar he had lighted, puffed at it, blew the smoke from under his mustache toward the ceiling, and looked at the thin cloud before answering. It was as if he had come intent on creating a disturbance through studied insolence.

"Well," he said, without noticing the hot, antagonistic attitude of the mine owner, "what do you think of the proffered agreement?"

"I think it's no good!" answered Mathews, facing him. "It's drawn up on a number-one scale. This mine ain't in that class."

"Say, *you* ring-one up with some P. A., too!"

"Well, smoke it yourself if you want that all-fired joy-feeling!"

Prince Albert is the cross-lots cut to tobacco satisfaction, whether you smoke a jimmy pipe or makin's cigarette! It hands out more genuine happiness each puff, and fresher fragrance each puff than you ever did dream would fall to your lot. The patented process *fixes that*—and cuts out bite and parch! From dawn's early light until turn-in-time you can smoke away, *man-like,* because there isn't any unpleasant comeback in

PRINCE ALBERT

the national joy smoke

Don't linger about what you're going to do about this pipe-packing and makin's-material question. Because, men, you're losing fun and contentment.

You buy some Prince Albert in the toppy red bag at a nickel or get a tidy red tin for a dime; or pick the handsome pound and half-pound tin humidors. But of all the P. A. packages, you'll find that classy crystal-glass pound humidor what you *need most!* The sponge-moistener top keeps the friendly tobacco in such bang-up trim!

R. J. REYNOLDS TOBACCO COMPANY
Winston-Salem, N. C.

"Oh! So you've signed 'em before."

"I have. A dozen times. This mine has but one shift—the regular day shift. It has but one engineer and a helper. It has but one mill boss."

"Working eight batteries?"

No. You know we couldn't work eight batteries with one small shift."

"Well, you've got to have an assistant millman at the union scale, you know," insisted the delegate.

"What to do? To loaf around, I suppose," Bill retorted.

"And you've got to have a turn up in the engine-house. You need another hoisting engineer," continued the delegate, as if all these matters had been decided by him beforehand.

Dick thought that he might gain a more friendly footing by taking part in the conversation himself.

"See here," he said. "The Croix d'Or isn't paying interest. Maybe we aren't using the requisite number of men as demanded under this rating; but they are all satisfied, and——"

"I don't know about that," interrupted the delegate, with an air of insolent assurance.

"And if we can't go on under the present conditions, we may as well shut down," Dick concluded.

"That's up to you," declared the delegate, with an air of disinterest. "If a mine can't pay for the working, it ought to shut down."

The partners looked at each other. There was a mutual question as to whether it would be policy to throw the delegate out of the door. Plainly they were in a predicament, for the man was master, in his way.

"Look here," Bill said, accepting the responsibility, "this ain't right. You know it ain't. We're in another class altogether. You ought to put us, at present, under——"

"It is right," belligerently asserted the delegate. "I've looked it all over. You'll agree to it, or I'll declare the Croix d'Or unfair."

He had arisen to his feet as if arbitrarily to end the argument. For a wonder, the veteran miner restrained himself, although there was a hard, glowing light in his eyes.

"We won't stand for it," he said, restraining Dick with his elbow. "When you're ready to talk on a square basis, come back, and we'll use the ink. Until then we won't. We might as well shut down, first as last, as to lose money when we're just breakin' even as it is. Think it over a while, and see if we ain't right."

"Well, you'll hear from me," declared the delegate, as he put his hat on his head and turned out of the door without any parting courtesy. "Keep the card. My name's Thompson, you know."

For a full minute after he had gone, the partners stared at each other with troubled faces.

"Oh, he's a bluff! That's all there is to it," asserted Mathews, reaching into the corner for his rubber boots, preparatory to going underground. "He knows it ain't right, just as well as I do. If he can put this over, all right. If he can't he'll give us the other rating."

He left Dick making up a time-roll, and turned down the hill; and they did not discuss it again until they were alone that night.

Get all pullets to laying before cold weather. If you do not, it will be hard to get them to lay during the winter. Pullets which lay in the fall make better breeders in the spring than those which wait till spring to begin laying.

Home Makers Conference

This Department is Edited by Miss Alice Kinney, New Franklin, Mo.

STATE OFFICERS
President, Mrs. Harry Sneed, Sedalia.
First V. P., Miss Louise Stanley, Columbia
Second V. P., Mrs. Horace Windsor, Boonville.
Cor. Sec., Miss Bab Bell, Columbia.
Rec. Sec., Mrs. D. H. Doane, Columbia.
Exec. Sec., Miss May McDonald, Columbia
Treas., Miss Ivan W. Philips, Kingville.

ADVISORY BOARD
Mrs. N. H. Gentry, Sedalia.
Mrs. Marie T. Harvey, Kirksville.
Mrs. F. B. Mumford, Columbia.
Mrs. R. E. Shryock, Kansas City.
Mrs. J. E. Roberts, Maysville.

FROM DAY TO DAY

IF.—From a Woman's Point of View.

If you can let your foot-free friends surprise you
When all your household wheels are out of gear,
If you can get a meal when all about you
Are piled the things there wasn't time to clear,
If you can serve them simple things serenely,
Without a word about the plight you're in,
The while you say unto your soul, 'Be seemly,"
And, in the bosom fight that follows, win,—

If you can love your child with all that's in you,
Yet firmly say the word that must be said,
Face tearful eyes and never let them daunt you,
And in the din that follows keep your head;
If you know life, yet trust your children in it
Because you see that God, who made the gale,
To vanquish sin gave unto man the Spirit,
Just as to fight head winds He gave the sail,—

If you can win respect from those who serve you,
And run your home, and not let it run you;
If you can face details nor let them dwarf you,
And keep your outlook broad, your vision true;
If you can let your sands of time run daily
Into a headlong stream of endless tasks,
And do the things you hate and do them gladly,
Because to serve is all the joy Love asks,—

If you can do, without the dust of doing,
And toiling, keep your soul and body fine,
If you can right the word and deeds you're ruing,
And lean on Love yet not become a vine;
If you can be a worthy wife and mother
And wisely meet all this shall bring to you,—
Fear not to share the burdens of your brother;
What Time shall ask, that, Woman, you can do!

—Jane Dowling Foote in Sunday Magazine.

RELATION OF STATE UNIVERSITY TO THE WORK FOR WOMEN

The University of Missouri should be a leader of public thought. Any phase of life in the state that can be improved by investigation of new truth or the extension of truth already well established is a function of the University

All universities have found it necessary and desirable to organize specialized courses and professional curricula for men. A few universities have organized a small number of specialized courses for women. The work of women is becoming increasingly important. There are more persos engaged in the profession of home making than any other single profession. Home making and housekeeping have been largely empirical and hence so far have been learned by a system of apprecentiship, but the practice of housekeeping is founded upon well established scientific principles. Such principles can be learned and taught.

It is far more important to the state that its women be educated for homekeeping than for other professions. It is more important because ninety per cent or more of the women follow the vocation of house-keeping.

A University supported by the people must provide higher education for all the people. It will not have accomplished this result until it has provided a thoroughly well organized and specialized course in home making and housekeeping for women.—F. B. Mumford, Dean of the College of Agriculture, University of Missouri.

HOME ECONOMICS EXHIBITS

This is a subject which I am very glad to discuss with you, because it seems to me that we are accomplishing such a small per cent of the good results which we should be gettin from our exhibit work. Now, why is this?

Let us look for a moment at the usual home economics exhibit. A list of articles is made out and the prize for each is noted. What articles are to appear on this list is usually decided by the committee in charge, keeping in mind those things which will show up best, but frequently the list is determined by the merchants who offer the prizes. Each man who offers one has the privilege of saying for what this prize shall go, and gets as his share of the spoils the entry which receives this prize. It is not at all strange under such conditions that there is a predominance of pie and cake over breds and other more necessary articles of food.

Each woman decides in just which rank she prefers to enter, and it is quite noticeable how full are the ranks where the best prizes are offered, while others may be quite depleted. She spends upon her entry just the length of time which it takes to make that definite article, or perhaps one woman has made a day of it and enters several articles. All the entries are brought together and some one decides which is best. One of the number gets the prize and each one of the others wonders why she did not get it. Each goes home no wiser than she was before, whether her cake takes the prize or not. It is a game of chance to most of them. How often have you heard a woman say, "I was lucky enough to get this prize."

But how can they be made more worth while? what have the men been doing in their exhibits? Let us look for a momet at the corn show and if we cannot get help. Here the men come from far and near, each bringing his selected ears. These are judged according to a definite standard—a score card it is called. This score card has been worked out by experts who have determined what characteristics in each grain and ear of corn are more worth while, and have assigned a numerical value to each of these characteristics. They are not chosen arbitrarily, but are selected according to the definite value of that special point to the corn and any influence it may have on the future plant. Each lot of corn entered is compared with this ideal standard and scored according to it, usually by an expert. The man who shows the best corn knows why his is best, the man who fails knows where he has failed. But that is not all—discussions are had, led by this expert, experience meetings, you might call them. Ideas are exchanged and each man goes home not only enthused with the idea that he will make his corn the best next year, but with a store of information that will enable him to make his better, if not the best.
